USP 40

THE UNITED STATES PHARMACOPEIA

NF 35

THE NATIONAL FORMULARY

Volume 3-1

*By authority of the United States Pharmacopeial Convention
Prepared by the Council of Experts and its Expert Committees*

Official from May 1, 2017

The designation on the cover of this publication, "USP NF 2017," is for ease of identification only. The publication contains two separate compendia: *The United States Pharmacopeia*, Fortieth Revision, and *The National Formulary*, Thirty-Fifth Edition.

THE UNITED STATES PHARMACOPEIAL CONVENTION
12601 Twinbrook Parkway, Rockville, MD 20852

SIX-MONTH IMPLEMENTATION GUIDELINE

The *United States Pharmacopeia–National Formulary* and its supplements become official six months after being released to the public. The *USP–NF*, which is released on November 1 of each year, becomes official on May 1 of the following year. This six-month implementation timing gives users more time to bring their methods and procedures into compliance with new and revised *USP–NF* requirements.

The table below describes the official dates of the *USP–NF* and its supplements. The 2016 *USP 39–NF 34*, and its supplements, *Interim Revision Announcements (IRAs)* and *Revision Bulletins* to that edition, will be official until May 1, 2017, at which time the *USP 40–NF 35* becomes official.

Publication	Release Date	Official Date	Official Until
<i>USP 40–NF 35</i>	November 1, 2016	May 1, 2017	May 1, 2018 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i>)
<i>First Supplement to the USP 40–NF 35</i>	February 1, 2017	August 1, 2017	May 1, 2018 (except as superseded by <i>Second Supplement</i> , <i>IRAs</i> , and <i>Revision Bulletins</i>)
<i>Second Supplement to the USP 40–NF 35</i>	June 1, 2017	December 1, 2017	May 1, 2018 (except as superseded by <i>IRAs</i> and <i>Revision Bulletins</i>)
<i>USP 41–NF 36</i>	November 1, 2017	May 1, 2018	May 1, 2019 (except as superseded by supplements, <i>IRAs</i> , and <i>Revision Bulletins</i>)

The table below gives the details of the *IRAs* that will apply to *USP 40–NF 35*.

IRA	PF Posting Date	Comment Due Date	IRA Posting Date	IRA Official Date
42(1)	January 4, 2017	March 31, 2017	May 27, 2017	July 1, 2017
42(2)	March 1, 2017	May 31, 2017	July 29, 2017	September 1, 2017
42(3)	May 2, 2017	July 31, 2017	September 30, 2017	November 1, 2017
42(4)	July 1, 2017	September 30, 2017	November 25, 2017	January 1, 2018
42(5)	September 1, 2017	November 30, 2017	January 27, 2018	March 1, 2018
42(6)	November 1, 2017	January 31, 2018	March 31, 2018	May 1, 2018

Revision Bulletins published on the USP website become official on the date specified in the *Revision Bulletin*.

NOTICE AND WARNING

Concerning U.S. Patent or Trademark Rights—The inclusion in *The United States Pharmacopeia* or in the *National Formulary* of a monograph on any drug in respect to which patent or trademark rights may exist shall not be deemed, and is not intended as, a grant of, or authority to exercise, any right or privilege protected by such patent or trademark. All such rights and privileges are vested in the patent or trademark owner, and no other person may exercise the same without express permission, authority, or license secured from such patent or trademark owner.

Concerning Use of USP or NF Text—Attention is called to the fact that *USP* and *NF* text is fully copyrighted. Authors and others wishing to use portions of the text should request permission to do so from the Secretary of the USPC Board of Trustees.

Guide to General Chapters

(For complete alphabetical list of all general chapters in this Pharmacopeia, see under "General chapters" in the index.)

GENERAL TESTS AND ASSAYS

General Requirements for Tests and Assays

(1) Injections	67
(2) Oral Drug Products—Product Quality Tests	74
(3) Topical and Transdermal Drug Products—Product Quality Tests	78
(4) Mucosal Drug Products—Product Quality Tests	86
(5) Inhalation and Nasal Drug Products—General Information and Product Quality Tests	90
(7) Labeling	98
(11) USP Reference Standards	104

Apparatus for Tests and Assays

(17) Prescription Container Labeling	107
(31) Volumetric Apparatus	110
(41) Balances	111

Microbiological Tests

(51) Antimicrobial Effectiveness Testing	111
(55) Biological Indicators—Resistance Performance Tests	114
(61) Microbiological Examination of Nonsterile Products: Microbial Enumeration Tests	117
(62) Microbiological Examination of Nonsterile Products: Tests for Specified Microorganisms	123
(63) Mycoplasma Tests	130
(71) Sterility Tests	136

Biological Tests and Assays

(81) Antibiotics—Microbial Assays	143
(85) Bacterial Endotoxins Test	163
(87) Biological Reactivity Tests, In Vitro	169
(88) Biological Reactivity Tests, In Vivo	172
(89) Enzymes Used as Ancillary Materials in Pharmaceutical Manufacturing	177
(89.1) Collagenase I	180
(89.2) Collagenase II	185
(90) Fetal Bovine Serum—Quality Attributes and Functionality Tests	190
(91) Calcium Pantothenate Assay	193
(92) Growth Factors and Cytokines Used in Cell Therapy Manufacturing	195
(111) Design and Analysis of Biological Assays	199
(115) Dexpanthenol Assay	203
(121) Insulin Assays	205
(121.1) Physicochemical Analytical Procedures for Insulins	207
(123) Glucagon Bioidentity Tests	210
(124) Erythropoietin Bioassays	213
(126) Somatotropin Bioidentity Tests	214

(127) Flow Cytometric Enumeration of CD34+ Cells	216
(129) Analytical Procedures for Recombinant Therapeutic Monoclonal Antibodies	221
(130) Protein A Quality Attributes	227
(151) Pyrogen Test	234
(161) Medical Devices—Bacterial Endotoxin and Pyrogen Tests	236
(162) Diphtheria Antitoxin Potency Testing for Human Immune Globulins	239
(165) Prekallikrein Activator	241
(171) Vitamin B ₁₂ Activity Assay	242

Chemical Tests and Assays

Identification Tests

(181) Identification—Organic Nitrogenous Bases	245
(191) Identification Tests—General	245
(191) Identification Tests—General	251
(193) Identification—Tetracyclines	254
(197) Spectrophotometric Identification Tests	255
(201) Thin-Layer Chromatographic Identification Test	256
(202) Identification of Fixed Oils By Thin-Layer Chromatography	257
(203) High-Performance Thin-Layer Chromatography Procedure for Identification of Articles of Botanical Origin	258

Limit Tests

(206) Aluminum	260
(207) Test for 1,6-Anhydro Derivative for Enoxaparin Sodium	261
(208) Anti-Factor Xa and Anti-Factor IIa Assays for Unfractionated and Low Molecular Weight Heparins	266
(209) Low Molecular Weight Heparin Molecular Weight Determinations	270
(211) Arsenic	272
(212) Oligosaccharide Analysis	273
(221) Chloride and Sulfate	287
(223) Dimethylaniline	287
(226) 4-Epi-anhydrotetracycline	288
(227) 4-Aminophenol in Acetaminophen-Containing Drug Products	288
(228) Ethylene Oxide and Dioxane	290
(231) Heavy Metals	293
(232) Elemental Impurities—Limits	295
(233) Elemental Impurities—Procedures	298
(241) Iron	301
(251) Lead	302
(261) Mercury	303
(267) Porosimetry by Mercury Intrusion	306
(268) Porosity by Nitrogen Adsorption-Desorption	309
(271) Readily Carbonizable Substances Test	314
(281) Residue on Ignition	314
(291) Selenium	315

afroozpharma@yahoo.com

Other Tests and Assays

(301) Acid-Neutralizing Capacity	316
(311) Alginates Assay	317
(341) Antimicrobial Agents—Content	318
(345) Assay for Citric Acid/Citrate and Phosphate	323
(351) Assay for Steroids	324
(371) Cobalamin Radiotracer Assay	324
(381) Elastomeric Closures for Injections	326
(391) Epinephrine Assay	331
(401) Fats and Fixed Oils	332
(411) Folic Acid Assay	345
(413) Impurities Testing in Medical Gases	349
(415) Medical Gases Assay	349
(425) Iodometric Assay—Antibiotics	353
(429) Light Diffraction Measurement of Particle Size	354
(431) Methoxy Determination	359
(441) Niacin or Niacinamide Assay	361
(451) Nitrite Titration	366
(461) Nitrogen Determination	366
(466) Ordinary Impurities	368
(467) Residual Solvents	369
(469) Ethylene Glycol, Diethylene Glycol, and Triethylene Glycol in Ethoxylated Substances	384
(471) Oxygen Flask Combustion	385
(481) Riboflavin Assay	386
(501) Salts of Organic Nitrogenous Bases	392
(503) Acetic Acid in Peptides	393
(503.1) Trifluoroacetic Acid (TFA) in Peptides	394
(507) Protein Determination Procedures	395
(511) Single-Steroid Assay	400
(525) Sulfur Dioxide	401
(531) Thiamine Assay	407
(541) Titrimetry	416
(551) Vitamin E Assay	419
(561) Articles of Botanical Origin	426
(563) Identification of Articles of Botanical Origin	440
(565) Botanical Extracts	452
(571) Vitamin A Assay	454
(580) Vitamin C Assay	459
(581) Vitamin D Assay	462
(591) Zinc Determination	471

Physical Tests and Determinations

(601) Inhalation and Nasal Drug Products: Aerosols, Sprays, and Powders—Performance Quality Tests	472
(602) Propellants	498
(603) Topical Aerosols	499
(604) Leak Rate	500
(610) Alternative Microbiological Sampling Methods for Nonsterile Inhaled and Nasal Products	501
(611) Alcohol Determination	503
(616) Bulk Density and Tapped Density of Powders	505
(621) Chromatography	508
(631) Color and Achromicity	520
(641) Completeness of Solution	521
(643) Total Organic Carbon	522
(645) Water Conductivity	523
(651) Congealing Temperature	527
(659) Packaging and Storage Requirements	529
(660) Containers—Glass	534
(661) Plastic Packaging Systems and Their Materials of Construction	541
(661.1) Plastic Materials of Construction	542
(661.2) Plastic Packaging Systems for Pharmaceutical Use	554
(670) Auxiliary Packaging Components	558
(671) Containers—Performance Testing	565
(691) Cotton	573
(695) Crystallinity	575

(696) Characterization of Crystalline Solids by Microcalorimetry and Solution Calorimetry	575
(697) Container Content for Injections	578
(698) Deliverable Volume	579
(699) Density of Solids	582
(701) Disintegration	584
(705) Quality Attributes of Tablets Labeled as Having a Functional Score	586
(711) Dissolution	588
(721) Distilling Range	598
(724) Drug Release	600
(729) Globule Size Distribution in Lipid Injectable Emulsions	607
(730) Plasma Spectrochemistry	611
(731) Loss on Drying	614
(733) Loss on Ignition	615
(735) X-Ray Fluorescence Spectrometry	615
(736) Mass Spectrometry	620
(741) Melting Range or Temperature	625
(755) Minimum Fill	628
(761) Nuclear Magnetic Resonance Spectroscopy	629
(771) Ophthalmic Products—Quality Tests	639
(776) Optical Microscopy	645
(781) Optical Rotation	648
(782) Vibrational Circular Dichroism Spectroscopy	649
(785) Osmolality and Osmolarity	656
(786) Particle Size Distribution Estimation by Analytical Sieving	658
(787) Subvisible Particulate Matter in Therapeutic Protein Injections	663
(788) Particulate Matter in Injections	665
(789) Particulate Matter in Ophthalmic Solutions	669
(790) Visible Particulates in Injections	671
(791) pH	672
(795) Pharmaceutical Compounding—Nonsterile Preparations	675
(797) Pharmaceutical Compounding—Sterile Preparations	683
(800) Hazardous Drugs—Handling in Healthcare Settings	727
(801) Polarography	746
(811) Powder Fineness	750
(821) Radioactivity	751
(823) Positron Emission Tomography	
Drugs for Compounding, Investigational, and Research Uses	758
(831) Refractive Index	768
(841) Specific Gravity	768
(846) Specific Surface Area	769
(852) Atomic Absorption Spectroscopy	773
(853) Fluorescence Spectroscopy	777
(854) Mid-Infrared Spectroscopy	783
(855) Nephelometry, Turbidimetry, and Visual Comparison	787
(857) Ultraviolet-Visible Spectroscopy	789
(861) Sutures—Diameter	795
(871) Sutures—Needle Attachment	796
(881) Tensile Strength	797
(891) Thermal Analysis	798
(905) Uniformity of Dosage Units	802
(911) Viscosity—Capillary Methods	806
(912) Viscosity—Rotational Methods	808
(913) Viscosity—Rolling Ball Method	812
(914) Viscosity—Pressure Driven Methods	814
(921) Water Determination	815
(941) Characterization of Crystalline and Partially Crystalline Solids by X-Ray Powder Diffraction (XRPD)	820

GENERAL NOTICES AND REQUIREMENTS

The *General Notices and Requirements* section (the *General Notices*) presents the basic assumptions, definitions, and default conditions for the interpretation and application of the *United States Pharmacopeia* (USP) and the *National Formulary* (NF).

Requirements stated in these *General Notices* apply to all articles recognized in the USP and NF (the "compendia") and to all general chapters unless specifically stated otherwise.

1. TITLE AND REVISION

The full title of this publication (consisting of four volumes and including its *Supplements*), is *The Pharmacopeia of the United States of America*, Fortieth Revision and the *National Formulary*, Thirty-Fifth Edition. These titles may be abbreviated to USP 40, to NF 35, and to USP 40–NF 35. The *United States Pharmacopeia*, Fortieth Revision, and the *National Formulary*, Thirty-Fifth Edition, supersede all earlier revisions. Where the terms "USP," "NF," or "USP–NF" are used without further qualification during the period in which these compendia are official, they refer only to USP 40, NF 35, and any *Supplement(s)* thereto. The same titles, with no further distinction, apply equally to print or electronic presentation of these contents. Although USP and NF are published under one cover and share these *General Notices*, they are separate compendia.

This revision is official beginning May 1, 2017 unless otherwise indicated in specific text.

Supplements to USP and NF are published periodically.

Accelerated Revisions, published periodically on the *Official Text* section of USP's website (<http://www.usp.org/usp-nf/official-text>), are designed to make revisions official more quickly than through the routine process for publishing standards in the USP–NF. *Interim Revision Announcements* are Accelerated Revisions to USP and NF that contain official revisions and their effective dates.

Revision Bulletins are Accelerated Revisions to official text or postponements that require expedited publication. They generally are official immediately unless otherwise specified in the *Revision Bulletin*.

Errata are Accelerated Revisions representing corrections to items erroneously published. Announcements of the availability of new USP Reference Standards and announcements of tests or procedures that are held in abeyance pending availability of required USP Reference Standards are also available on the "Official Text" tab of USP's website.

2. OFFICIAL STATUS AND LEGAL RECOGNITION

2.10. Official Text

Official text of the USP and NF is published in the USP–NF Online (www.uspnf.com) in the edition identified as "CURRENTLY OFFICIAL" and in Accelerated Revisions that supersede the USP–NF Online as described below.

Routine revisions are published in the USP–NF Online and become official on the date indicated, usually six months after publication. Accelerated Revisions supersede the USP–NF Online and become official on the date indicated. Links to Accelerated Revisions on the USP website can be found in any superseded monograph or general chapter in the USP–NF Online.

Print and USB flash drive versions of the USP and NF also are available. Routine revisions are provided with the same timing as the USP–NF Online. Official text published in *Supplements* supersedes that in the previously published print or

USB flash drive versions of USP–NF. These versions also are superseded by Accelerated Revisions as described above.

In the event of any disparity between the print or USB flash drive versions and the USP–NF Online, the USP–NF Online will be deemed to apply.

2.20. Official Articles

An *official article* is an article that is recognized in USP or NF. An article is deemed to be recognized and included in a compendium when a monograph for the article is published in the compendium and an official date is generally or specifically assigned to the monograph.

The title specified in a monograph is the *official title* for such article. Other names considered to be synonyms of the official titles may not be used as substitutes for official titles.

Official articles include both *official substances* and *official products*. An *official substance* is a drug substance, excipient, dietary ingredient, other ingredient, or component of a finished device for which the monograph title includes no indication of the nature of the finished form.

An *official product* is a drug product, dietary supplement, compounded preparation, or finished device for which a monograph is provided.

2.30. Legal Recognition

The USP and NF are recognized in the laws and regulations of many countries throughout the world. Regulatory authorities may enforce the standards presented in the USP and NF, but because recognition of the USP and NF may vary by country, users should understand applicable laws and regulations. In the United States under the Federal Food, Drug, and Cosmetic Act (FDCA), both USP and NF are recognized as official compendia. A drug with a name recognized in USP–NF must comply with compendial identity standards or be deemed adulterated, misbranded, or both. See, e.g., FDCA § 501(b) and 502(e)(3)(b); also FDA regulations, 21 CFR § 299.5(a&b). To avoid being deemed adulterated, such drugs must also comply with compendial standards for strength, quality, and purity, unless labeled to show all respects in which the drug differs. See, e.g., FDCA § 501(b) and 21 CFR § 299.5(c). In addition, to avoid being deemed misbranded, drugs recognized in USP–NF must also be packaged and labeled in compliance with compendial standards. See FDCA § 502(g).

A dietary supplement represented as conforming to specifications in USP will be deemed a misbranded food if it fails to so conform. See FDCA § 403(s)(2)(D).

Enforcement of USP standards is the responsibility of FDA and other government authorities in the U.S. and elsewhere. USP has no role in enforcement.

Change to read:

3. CONFORMANCE TO STANDARDS

3.10. Applicability of Standards

Standards for an article recognized in the compendia (USP–NF) are expressed in the article's monograph, applicable general chapters, and *General Notices*. The identity, strength, quality, and purity of an article are determined by the official tests, procedures, and acceptance criteria, and other requirements incorporated in the monograph, in applicable general chapters, or in the *General Notices*. "Applicable general chapters" means general chapters numbered

afroozpharma@yahoo.com

below 1000 or above 2000 that are made applicable to an article through reference in *General Notices*, a monograph, or another applicable general chapter numbered below 1000. Where the requirements of a monograph differ from the requirements specified in these *General Notices* or an applicable general chapter, the monograph requirements apply and supersede the requirements of the *General Notices* or applicable general chapters, whether or not the monograph explicitly states the difference.

General chapters numbered 1000 to 1999 are for informational purposes only. They contain no mandatory tests, assays, or other requirements applicable to any official article, regardless of citation in a general chapter numbered below 1000, a monograph, or these *General Notices*. General chapters numbered above 2000 apply only to articles that are intended for use as dietary ingredients and dietary supplements. General chapter citations in *NF* monographs refer to *USP* general chapters.

Early adoption of revised standards in advance of the official date is allowed by *USP* unless specified otherwise at the time of publication. Where revised standards for an existing article have been published as final approved "official text" (as approved in section 2.10 *Official Text*) but have not yet reached the official date (six months after publication, unless otherwise specified; see "official date", section 2.20 *Official Articles*), compliance with the revised standard shall not preclude a finding or indication of conformance with compendial standards, unless *USP* specifies otherwise by prohibiting early adoption in a particular standard.

The standards in the relevant monograph, general chapter(s), and *General Notices* apply at all times in the life of the article from production to expiration. It is also noted that the manufacturer's specifications, and manufacturing practices (e.g., Quality by Design, Process Analytical Technology, and Real Time Release Testing initiatives), generally are followed to ensure that the article will comply with compendial standards until its expiration date, when stored as directed. Every compendial article in commerce shall be so constituted that when examined in accordance with these assays and test procedures, it meets all applicable pharmacopeial requirements (*General Notices*, monographs, and general chapters). Thus, any official article is expected to meet the compendial standards if tested, and any official article actually tested as directed in the relevant monograph must meet such standards to demonstrate compliance.

Some tests, such as those for Dissolution and Uniformity of Dosage Units, require multiple dosage units in conjunction with a decision scheme. These tests, albeit using a number of dosage units, are in fact one determination. These procedures should not be confused with statistical sampling plans. The similarity to statistical procedures may seem to suggest an intent to make inference to some larger group of units, but in all cases, statements about whether the compendial standard is met apply only to the units tested. Repeats, replicates, statistical rejection of outliers, or extrapolations of results to larger populations, as well as the necessity and appropriate frequency of batch testing, are neither specified nor proscribed by the compendia; such decisions are based on the objectives of the testing. Frequency of testing and sampling are left to the preferences or direction of those performing compliance testing, and other users of *USP-NF*, including manufacturers, buyers, or regulatory authorities.

Official products are prepared according to recognized principles of good manufacturing practice and from ingredi-

ents that meet *USP* or *NF* standards, where standards for such ingredients exist (for dietary supplements, see section 3.10.20).

Official substances are prepared according to recognized principles of good manufacturing practice and from ingredients complying with specifications designed to ensure that the resultant substances meet the requirements of the compendial monographs.

3.10.10. Applicability of Standards to Drug Products, Drug Substances, and Excipients

The applicable *USP* or *NF* standard applies to any article marketed in the United States that (1) is recognized in the compendium and (2) is intended or labeled for use as a drug or as an ingredient in a drug. Such articles (drug products, drug substances, and excipients) include both human drugs (whether dispensed by prescription, "over the counter," or otherwise), as well as animal drugs. The applicable standard applies to such articles whether or not the added designation "*USP*" or "*NF*" is used. The standards apply equally to articles bearing the official titles or names derived by transposition of the definitive words of official titles or transposition in the order of the names of two or more active ingredients in official titles, or where there is use of synonyms with the intent or effect of suggesting a significant degree of identity with the official title or name.

3.10.20. Applicability of Standards to Medical Devices, Dietary Supplements, and Their Components and Ingredients

An article recognized in *USP* or *NF* shall comply with the compendial standards if the article is a medical device, component intended for a medical device, dietary supplement, dietary ingredient, or other ingredient that is intended for incorporation into a dietary supplement, and is labeled as conforming to the *USP* or *NF*.

Generally, dietary supplements are prepared from ingredients that meet *USP*, *NF*, or *Food Chemicals Codex* standards. Where such standards do not exist, substances may be used in dietary supplements if they have been shown to be of acceptable food grade quality using other suitable procedures.

*3.10.30. Applicability of Standards to the Practice of Compounding (New)

USP compounding practice standards, *Pharmaceutical Compounding—Nonsterile Preparations* (795) and *Pharmaceutical Compounding—Sterile Preparations* (797), as appropriate, apply to compounding practice or activity regardless of whether a monograph exists for the compounded preparation or these chapters are referenced in such a monograph. In the United States, (795) and (797) are not applicable to drugs compounded by entities registered with FDA as outsourcing facilities as defined by FDCA § 503B, because such facilities are required to comply with FDA's current good manufacturing practice requirements. Compounded preparations, including drug products compounded by outsourcing facilities, may also be subject to applicable monographs; see section 2.20 *Official Articles* and section 4.10 *Monographs*. ▲*USP40*

3.20. Indicating Conformance

A drug product, drug substance, or excipient may use the designation "*USP*" or "*NF*" in conjunction with its official title or elsewhere on the label only when (1) a monograph

afroozpharma@yahoo.com

is provided in the specified compendium and (2) the article complies with the identity prescribed in the specified compendium.

When a drug product, drug substance, compounded preparation, or excipient differs from the relevant *USP* or *NF* standard of strength, quality, or purity, as determined by the application of the tests, procedures, and acceptance criteria set forth in the relevant compendium, its difference shall be plainly stated on its label.

When a drug product, drug substance, compounded preparation, or excipient fails to comply with the identity prescribed in *USP* or *NF* or contains an added substance that interferes with the prescribed tests and procedures, the article shall be designated by a name that is clearly distinguishing and differentiating from any name recognized in *USP* or *NF*.

A medical device, dietary supplement, or ingredient or component of a medical device or dietary supplement may use the designation "USP" or "NF" in conjunction with its official title or elsewhere on the label only when (1) a monograph is provided in the specified compendium and (2) the article complies with the monograph standards and other applicable standards in that *USP* or *NF* compendium.

The designation "USP" or "NF" on the label may not and does not constitute an endorsement by USP and does not represent assurance by USP that the article is known to comply with the relevant standards. USP may seek legal redress if an article purports to be or is represented as an official article in one of USP's compendia and such claim is determined by USP not to be made in good faith.

The designation "USP-NF" may be used on the label of an article provided that the label also bears a statement such as "Meets *NF* standards as published by USP," indicating the particular compendium to which the article purports to apply.

When the letters "USP," "NF," or "USP-NF" are used on the label of an article to indicate compliance with compendial standards, the letters shall appear in conjunction with the official title of the article. The letters are not to be enclosed in any symbol such as a circle, square, etc., and shall appear in capital letters.

If a dietary supplement does not comply with all applicable compendial requirements but contains one or more dietary ingredients or other ingredients that are recognized in *USP* or *NF*, the individual ingredient(s) may be designated as complying with *USP* or *NF* standards or being of *USP* or *NF* quality provided that the designation is limited to the individual ingredient(s) and does not suggest that the dietary supplement complies with *USP* standards.

4. MONOGRAPHS AND GENERAL CHAPTERS

4.10. Monographs

Monographs set forth the article's name, definition, specification, and other requirements related to packaging, storage, and labeling. The specification consists of tests, procedures, and acceptance criteria that help ensure the identity, strength, quality, and purity of the article. For general requirements relating to specific monograph sections, see section 5 *Monograph Components*.

Because monographs may not provide standards for all relevant characteristics, some official substances may conform to the *USP* or *NF* standard but differ with regard to nonstandardized properties that are relevant to their use in specific preparations. To assure substitutability in such instances, users may wish to ascertain functional equivalence or determine such characteristics before use.

4.10.10. Applicability of Test Procedures

A single monograph may include more than one test, procedure, and/or acceptance criterion for the same attribute. Unless otherwise specified in the monograph, all tests are requirements. In some cases, monograph instructions allow the selection of tests that reflect attributes of different manufacturers' articles, such as different polymorphic forms, impurities, hydrates, and dissolution. Monograph instructions

indicate the tests, procedures, and/or acceptance criteria to be used and the required labeling.

The order in which the tests are listed in the monograph is based on the order in which they are approved by the relevant Expert Committee for inclusion in the monograph. Test 1 is not necessarily the test for the innovator or for the reference product. Depending on monograph instructions, a labeling statement is not typically required if Test 1 is used.

4.10.20. Acceptance Criteria

The acceptance criteria allow for analytical error, for unavoidable variations in manufacturing and compounding, and for deterioration to an extent considered acceptable under practical conditions. The existence of compendial acceptance criteria does not constitute a basis for a claim that an official substance that more nearly approaches 100 percent purity "exceeds" compendial quality. Similarly, the fact that an article has been prepared to tighter criteria than those specified in the monograph does not constitute a basis for a claim that the article "exceeds" the compendial requirements.

An official product shall be formulated with the intent to provide 100 percent of the quantity of each ingredient declared on the label. Where the minimum amount of a substance present in a dietary supplement is required by law to be higher than the lower acceptance criterion allowed for in the monograph, the upper acceptance criterion contained in the monograph may be increased by a corresponding amount.

The acceptance criteria specified in individual monographs and in the general chapters for compounded preparations are based on such attributes of quality as might be expected to characterize an article compounded from suitable bulk drug substances and ingredients, using the procedures provided or recognized principles of good compounding practice, as described in these compendia.

4.20. General Chapters

Each general chapter is assigned a number that appears in angle brackets adjacent to the chapter name (e.g., *Chromatography* (621)). General chapters may contain the following:

- Descriptions of tests and procedures for application through individual monographs,
- Descriptions and specifications of conditions and practices for pharmaceutical compounding,
- General information for the interpretation of the compendial requirements,
- Descriptions of general pharmaceutical storage, dispensing, and packaging practices, or
- General guidance to manufacturers of official substances or official products.

When a general chapter is referenced in a monograph, acceptance criteria may be presented after a colon.

Some chapters may serve as introductory overviews of a test or of analytical techniques. They may reference other general chapters that contain techniques, details of the procedures, and, at times, acceptance criteria.

Change to read:

5. MONOGRAPH COMPONENTS

5.10. Molecular Formula

The use of the molecular formula for the active ingredient(s) named in defining the required strength of a compendial article is intended to designate the chemical entity or entities, as given in the complete chemical name of the article, having absolute (100 percent) purity.

5.20. Added Substances

Added substances are presumed to be unsuitable for inclusion in an official article and therefore prohibited, if their presence impairs the bioavailability, therapeutic efficacy, or safety of the official article; or they interfere with the assays and tests prescribed for determining compliance with the

afroozpharma@yahoo.com

compendial standards (see section 3.20 *Indicating Conformance*).

The air in a container of an official article may, where appropriate, be evacuated or be replaced by carbon dioxide, helium, argon, or nitrogen, or by a mixture of these gases. The use of such gas need not be declared in the labeling.

5.20.10. Added Substances in Official Substances

Official substances may contain only the specific added substances that are permitted by the individual monograph. Such added substances shall not exceed the quantity required for providing their intended effect. Where such addition is permitted, the label shall indicate the name(s) and amount(s) of any added substance(s).

5.20.20. Added Substances (Excipients and Ingredients) in Official Products

Suitable substances and excipients such as antimicrobial agents, pharmaceutical bases, carriers, coatings, flavors, preservatives, stabilizers, and vehicles may be added to an official product to enhance its stability, usefulness, or elegance, or to facilitate its preparation, unless otherwise specified in the individual monograph.

Added substances and excipients employed solely to impart color may be incorporated into official products other than those intended for parenteral or ophthalmic use, in accordance with the regulations pertaining to the use of colors issued by the U.S. Food and Drug Administration (FDA), provided such added substances or excipients are otherwise appropriate in all respects. (See also *Injections and Implanted Drugs Products* (1), *Product Quality Tests Common to Parenteral Dosage Forms, Specific Tests, Vehicles and added substances, Added substances*.) ^{▲USP40}

The proportions of the substances constituting the base in ointment and suppository products and preparations may be varied to maintain a suitable consistency under different climatic conditions, provided that the concentrations of active ingredients are not varied and provided that the bioavailability, therapeutic efficacy, and safety of the preparation are not impaired.

5.20.20.1. In Compounded Preparations

Compounded preparations for which a complete composition is given shall contain only the ingredients named in the formulas unless specifically exempted herein or in the individual monograph. Deviation from the specified processes or methods of compounding, although not from the ingredients or proportions thereof, may occur provided that the finished preparation conforms to the relevant standards and to preparations produced by following the specified process.

Where a monograph for a compounded preparation calls for an ingredient in an amount expressed on the dried basis, the ingredient need not be dried before use if due allowance is made for the water or other volatile substances present in the quantity taken.

Specially denatured alcohol formulas are available for use in accordance with federal statutes and regulations of the Internal Revenue Service. A suitable formula of specially denatured alcohol may be substituted for Alcohol in the manufacture of official preparations intended for internal or topical use, provided that the denaturant is volatile and does not remain in the finished product. A preparation that is intended for topical application to the skin may contain specially denatured alcohol, provided that the denaturant is either a usual ingredient in the preparation or a permissible added substance; in either case the denaturant shall be identified on the label of the topical preparation. Where a process is given in the individual monograph, any preparation compounded using denatured alcohol shall be identical to that prepared by the monograph process.

5.20.20.2. In Dietary Supplements

Additional ingredients may be added to dietary supplement products provided that the additional ingredients: (1) comply with applicable regulatory requirements; and (2) do

not interfere with the assays and tests prescribed for determining compliance with compendial standards.

5.30. Description and Solubility

Only where a quantitative solubility test is given in a monograph and is designated as such is it a test for purity.

A monograph may include information regarding the article's description. Information about an article's "description and solubility" also is provided in the reference table *Description and Relative Solubility of USP and NF Articles*. The reference table merely denotes the properties of articles that comply with monograph standards. The reference table is intended primarily for those who use, prepare, and dispense drugs and/or related articles. Although the information provided in monographs and the information in the reference table may indirectly assist in the preliminary evaluation of an article, it is not intended to serve as a standard or test for purity.

The approximate solubility of a compendial substance is indicated by one of the following descriptive terms:

Descriptive Term	Parts of Solvent Required for 1 Part of Solute
Very soluble	Less than 1
Freely soluble	From 1 to 10
Soluble	From 10 to 30
Sparingly soluble	From 30 to 100
Slightly soluble	From 100 to 1,000
Very slightly soluble	From 1,000 to 10,000
Practically insoluble, or Insoluble	Greater than or equal to 10,000

5.40. Identity

A compendial test titled *Identity* or *Identification* is provided as an aid in verifying the identity of articles as they are purported to be, e.g., those taken from labeled containers, and to establish whether it is the article named in USP-NF. The *Identity* or *Identification* test for a particular article may consist of one or more procedures. When a compendial test for *Identity* or *Identification* is undertaken, all requirements of all specified procedures in the test must be met to satisfy the requirements of the test. Failure of an article to meet all the requirements of a prescribed *Identity* or *Identification* test (i.e., failure to meet the requirements of all of the specified procedures that are components of that test) indicates that the article is mislabeled and/or adulterated.

5.50. Assay

Assay tests for compounded preparations are not intended for evaluating a compounded preparation before dispensing, but instead are intended to serve as the official test in the event of a question or dispute regarding the preparation's conformance to official standards.

5.50.10. Units of Potency (Biological)

For substances that cannot be completely characterized by chemical or physical means or that need confirmation of functionality or tertiary structure, it may be necessary to express quantities of biological activity in units of biological potency, each defined by an authoritative, designated reference standard. In cases where international reference materials have been discontinued, international units of potency may be defined in terms of molecular mass, such as in the cases of vitamins A, D, and E.

Where available, World Health Organization (WHO) international biological standards define the International Units (IU). USP monographs refer to the units assigned by USP Reference Standards either directly as International Units (IU) or as "USP Units." For some biological products, units of potency are value assigned against a corresponding U.S. Standard established by FDA, whether or not International Units or USP Units have been defined (see *Biologics* (1041)). Note that product-related labeling, e.g., on containers, need not use the full phrase "USP [product name] Units" that

afroozpharma@yahoo.com

appears in many USP monograph labeling sections. The term "USP Units" can be used on product labeling consistent with USP compendial requirements, provided it is clear from the context that the volume is stated in terms of USP [product name] Units. In such circumstances it should be clear that "USP Units" and "USP [product name] Units" share the same meaning.

5.60. Impurities and Foreign Substances

Tests for the presence of impurities and foreign substances are provided to limit such substances to amounts that are unobjectionable under conditions in which the article is customarily employed (see also *Impurities in Drug Substances and Drug Products* (1086)).

Nonmonograph tests and acceptance criteria suitable for detecting and controlling impurities that may result from a change in the processing methods or that may be introduced from external sources should be employed in addition to the tests provided in the individual monograph, where the presence of the impurity is inconsistent with applicable good manufacturing practices or good pharmaceutical practices.

5.60.10. Other Impurities in USP and NF Articles

If a USP or NF monograph includes an assay or organic impurity test based on chromatography, other than a test for residual solvents, and that monograph procedure does not detect an impurity present in the substance, the amount and identity of the impurity, where both are known, shall be stated in the labeling (certificate of analysis) of the official substance, under the heading *Other Impurity(ies)*.

The presence of any unlabeled other impurity in an official substance is a variance from the standard if the content is 0.1% or greater. The sum of all *Other Impurities* combined with the monograph-detected impurities may not exceed 2.0% (see *Ordinary Impurities* (466)), unless otherwise stated in the monograph.

The following categories of drug substances are excluded from *Other Impurities* requirements:

- Fermentation products and semi-synthetics derived therefrom,
- Radiopharmaceuticals,
- Biologics,
- Biotechnology-derived products,
- Peptides,
- Herbals, and
- Crude products of animal or plant origin.

Any substance known to be toxic shall not be listed under *Other Impurities*.

5.60.20. Residual Solvents in USP and NF Articles

All USP and NF articles are subject to relevant control of residual solvents, even when no test is specified in the individual monograph. If solvents are used during production, they must be of suitable quality. In addition, the toxicity and residual level of each solvent shall be taken into consideration, and the solvents limited according to the principles defined and the requirements specified in *Residual Solvents* (467), using the general methods presented therein or other suitable methods.

5.60.30. Elemental Impurities in USP Drug Products and Dietary Supplements

Effective January 1, 2018, elemental impurities will be controlled in official drug products according to the principles defined and requirements specified in *Elemental Impurities—Limits* (232). Effective January 1, 2018, elemental contaminants are controlled in official dietary supplements according to the principles defined and requirements specified in *Elemental Contaminants in Dietary Supplements* (2232). Also effective January 1, 2018, *Heavy Metals* (231) will be omitted and all references to it in general chapters and monographs will be deleted. Early adoption of the requirements in (232) and (2232) are permitted by USP, and if (232) or (2232), as applicable, is fully implemented with respect to a particular drug product or dietary supplement in advance of the January 1, 2018 date, that product and its ingredients will no longer need to comply with applicable

(231) requirements to be considered by USP to be in conformance with USP–NF requirements.

5.70. Performance Tests

Where content uniformity determinations have been made using the same analytical methodology specified in the Assay, with appropriate allowances made for differences in sample preparation, the average of all of the individual content uniformity determinations may be used as the Assay value.

5.80. USP Reference Standards

USP Reference Standards are authentic specimens that have been approved as suitable for use as comparison standards in USP or NF tests and assays. (See *USP Reference Standards* (11).) Where USP or NF tests or assays call for the use of a USP Reference Standard, only those results obtained using the specified USP Reference Standard are conclusive. Where a procedure calls for the use of a compendial article rather than for a USP Reference Standard as a material standard of reference, a substance meeting all of the compendial monograph requirements for that article shall be used. If any new USP or NF standard requires the use of a new USP Reference Standard that is not yet available, that portion of the standard containing the requirement shall not be official until the specified USP reference material is available.

Unless a Reference Standard label bears a specific potency or content, assume the Reference Standard is 100.0% pure in the official application. Unless otherwise directed in the procedure in the individual monograph or in a general chapter, USP Reference Standards are to be used in accordance with the instructions on the label of the Reference Standard.

Change to read:

6. TESTING PRACTICES AND PROCEDURES

6.10. Safe Laboratory Practices

In performing compendial procedures, safe laboratory practices shall be followed, including precautionary measures, protective equipment, and work practices consistent with the chemicals and procedures used. Before undertaking any procedure described in the compendia, the analyst should be aware of the hazards associated with the chemicals and the techniques and means of protecting against them. These compendia are not designed to describe such hazards or protective measures.

6.20. Automated Procedures

Automated and manual procedures employing the same basic chemistry are considered equivalent.

6.30. Alternative and Harmonized Methods and Procedures

Alternative methods and/or procedures may be used if they provide advantages in terms of accuracy, sensitivity, precision, selectivity, or adaptability to automation or computerized data reduction, or in other special circumstances. Such alternative procedures and methods shall be validated as described in *Validation of Compendial Procedures* (1225) and must be shown to give equivalent or better results. Only those results obtained by the methods and procedures given in the *compendia* ^{USP40} are conclusive.

Alternative procedures should be submitted to USP for evaluation as a potential replacement or addition to the standard (see section 4.10 *Monographs*).

Certain general chapters contain a statement that the text in question is harmonized with the corresponding text of the *European Pharmacopoeia* and/or the *Japanese Pharmacopoeia* and that these texts are interchangeable. Therefore, if a substance or preparation is found to comply with a requirement using an interchangeable method or procedure from one of these pharmacopoeias, it should comply with the requirements of the USP–NF. When a difference appears, or in the event of dispute, only the result obtained by the method and/or procedure given in the USP–NF is conclusive.

afroozpharma@yahoo.com

6.40. Dried, Anhydrous, Ignited, or Solvent-Free Basis

All calculations in the compendia assume an "as-is" basis unless otherwise specified.

Test procedures may be performed on the undried or unignited substance and the results calculated on the dried, anhydrous, or ignited basis, provided a test for *Loss on Drying*, or *Water Determination*, or *Loss on Ignition*, respectively, is given in the monograph. Where the presence of moisture or other volatile material may interfere with the procedure, previous drying of the substance is specified in the individual monograph and is obligatory.

The term "solvent-free" signifies that the calculation shall be corrected for the presence of known solvents as determined using the methods described in (467) unless a test for limit of organic solvents is provided in the monograph.

The term "previously dried" without qualification signifies that the substance shall be dried as directed under *Loss on Drying* (731) or *Water Determination* (921) (gravimetric determination).

Where drying in vacuum over a desiccant is directed, a vacuum desiccator, a vacuum drying pistol, or other suitable vacuum drying apparatus shall be used.

6.40.10. Ignite to Constant Weight

"Ignite to constant weight" means that ignition shall be continued at $800 \pm 25^\circ$, unless otherwise indicated, until two consecutive weighings, the second of which is taken after an additional period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

6.40.20. Dried to Constant Weight

"Dried to constant weight" means that drying shall be continued until two consecutive weighings, the second of which is taken after an additional drying period appropriate to the nature and quantity of the residue, do not differ by more than 0.50 mg per g of substance taken.

6.50. Preparation of Solutions**6.50.10. Filtration**

Where a procedure gives direction to "filter" without further qualification, the liquid shall be passed through suitable filter paper or equivalent device until the filtrate is clear. Due to the possibility of filter effects, the initial volumes of a filtrate may be discarded.

6.50.20. Solutions

Unless otherwise specified, all solutions shall be prepared with Purified Water. Solutions for quantitative measures shall be prepared using accurately weighed or accurately measured analytes (see section 8.20 *About*).

An expression such as "(1 in 10)" means that 1 part by volume of a liquid shall be diluted with, or 1 part by weight of a solid shall be dissolved in, a sufficient quantity of the diluent or solvent to make the volume of the finished solution 10 parts by volume. An expression such as "(20:5:2)" means that the respective numbers of parts, by volume, of the designated liquids shall be mixed, unless otherwise indicated.

6.50.20.1. Adjustments to Solutions

When a specified concentration is called for in a procedure, a solution of other normality or molarity may be used, provided that allowance is made for the difference in concentration and that the change does not increase the error of measurement.

Proportionately larger or smaller quantities than the specified weights and volumes of assay or test substances and Reference Standards may be taken, provided the measurement is made with at least equivalent accuracy.

Unless otherwise indicated, analyte concentrations shall be prepared to within ten percent (10%) of the indicated value. In the case in which a procedure is adapted to the working range of an instrument, solution concentrations may differ from the indicated value by more than ten percent (10%), with appropriate changes in associated calculations. Any changes shall fall within the validated range of the instrument.

When adjustment of pH is indicated with either an acid or base and the concentration is not indicated, appropriate concentrations of that acid or base may be used.

6.50.20.2. Test Solutions

Information on Test Solutions (TS) is provided in the *Test Solutions* portion of the *Reagents, Indicators, and Solutions* section of the USP-NF. Use of an alternative Test Solution or a change in the Test Solution used may require validation.

6.50.20.3. Indicator Solutions

Where a procedure specifies the use of an indicator TS, approximately 0.2 mL, or 3 drops, of the solution shall be added unless otherwise directed.

6.60. Units Necessary to Complete a Test

Unless otherwise specified, a sufficient number of units to ensure a suitable analytical result shall be taken.

6.60.10. Tablets

Where the procedure of a Tablet monograph directs to weigh and finely powder not fewer than a given number of Tablets, a counted number of Tablets shall be weighed and reduced to a powder. The portion of the powdered Tablets taken shall be representative of the whole Tablets and shall, in turn, be weighed accurately.

6.60.20. Capsules

Where the procedure of a Capsule monograph gives direction to remove, as completely as possible, the contents of not fewer than a given number of the Capsules, a counted number of Capsules shall be carefully opened and the contents quantitatively removed, combined, mixed, and weighed accurately. The portion of mixed Capsules contents taken shall be representative of the contents of the Capsules and shall, in turn, be weighed accurately.

6.70. Reagents

The proper conduct of the compendial procedures and the reliability of the results depend, in part, upon the quality of the reagents used in the performance of the procedures. Unless otherwise specified, reagents conforming to the specifications set forth in the current edition of *Reagent Chemicals* published by the American Chemical Society (ACS) shall be used. Where such ACS reagent specifications are not available or where the required purity differs, compendial specifications for reagents of acceptable quality are provided (see the *Reagents, Indicators, and Solutions* section of the USP-NF). Reagents not covered by any of these specifications should be of a grade suitable to the proper performance of the method of assay or test involved.

Listing of these reagents, including the indicators and solutions employed as reagents, in no way implies that they have therapeutic utility; furthermore, any reference to USP or NF in their labeling shall include also the term "reagent" or "reagent grade." USP may supply reagents if they otherwise may not be generally commercially available.

6.80. Equipment

Unless otherwise specified, a specification for a definite size or type of container or apparatus in a procedure is given solely as a recommendation. Other dimensions or types may be used if they are suitable for the intended use.

6.80.10. Apparatus for Measurement

Where volumetric flasks or other exact measuring, weighing, or sorting devices are specified, this or other equipment of at least equivalent accuracy shall be employed.

6.80.10.1. Pipet/Pipette

Where a pipet/pipette is specified, a suitable buret may be substituted. Where a "to contain" pipet/pipette is specified, a suitable volumetric flask may be substituted.

6.80.10.2. Light Protection

Where low-actinic or light-resistant containers are specified, either containers specially treated to protect contents from light or clear containers that have been rendered opaque by application of a suitable coating or wrapping may be used.

afroozpharma@yahoo.com

6.80.20. Instrumental Apparatus

An instrument may be substituted for the specified instrument if the substitute uses the same fundamental principles of operation and is of equivalent or greater sensitivity and accuracy. These characteristics shall be qualified as appropriate. Where a particular brand or source of a material, instrument, or piece of equipment, or the name and address of a manufacturer or distributor, is mentioned (ordinarily in a footnote), this identification is furnished solely for informational purposes as a matter of convenience, without implication of approval, endorsement, or certification.

6.80.20.1. Chromatographic Tubes and Columns

The term "diameter" refers to internal diameter (ID).

6.80.20.2. Tubing

The term "diameter" refers to outside diameter (OD).

6.80.20.3. Steam Bath

Where use of a steam bath is directed, use actively flowing steam or another regulated heat source controlled at an equivalent temperature.

6.80.20.4. Water Bath

A water bath requires vigorously boiling water unless otherwise specified.

6.80.30. Temperature Reading Devices

Temperature reading devices suitable for pharmacopeial tests conform to specifications that are traceable to a National Institute of Standards and Technology (NIST) standard or equivalent. Temperature reading devices may be of the liquid-in-glass type or an analog or digital temperature indicator type, such as a resistance temperature device, thermistor, or thermocouple. Standardization of thermometers is performed on an established testing frequency with a temperature standard traceable to NIST. For example, refer to the current issue of American Society of Testing and Materials (ASTM) standards E1 for liquid-in-glass thermometers.

7. TEST RESULTS**7.10. Interpretation of Requirements**

Analytical results observed in the laboratory (or calculated from experimental measurements) are compared with stated acceptance criteria to determine whether the article conforms to compendial requirements.

The reportable value, which often is a summary value for several individual determinations, is compared with the acceptance criteria. The reportable value is the end result of a completed measurement procedure, as documented.

Where acceptance criteria are expressed numerically herein through specification of an upper and/or lower limit, permitted values include the specified values themselves, but no values outside the limit(s). Acceptance criteria are considered significant to the last digit shown.

7.10.5. Nominal Concentrations in Equations

Where a "nominal concentration" is specified, calculate the concentration based on the label claim. In assay procedures, water correction is typically stated in the Definition

and on the label of the USP Reference Standard. For other procedures, correction for assayed content, potency, or both is made prior to using the concentration in the equation provided in the monograph.

7.10.10. Equivalence Statements in Titrimetric Procedures

The directions for titrimetric procedures conclude with a statement of the weight of the analyte that is equivalent to each mL of the standardized titrant. In such an equivalence statement, the number of significant figures in the concentration of the titrant should be understood to correspond to the number of significant figures in the weight of the analyte. Corrections to calculations based on the blank determination are to be made for all titrimetric assays where appropriate (see *Titrimetry* (541)).

7.20. Rounding Rules

The observed or calculated values shall be rounded off to the number of decimal places that is in agreement with the limit expression. Numbers should not be rounded until the final calculations for the reportable value have been completed. Intermediate calculations (e.g., slope for linearity) may be rounded for reporting purposes, but the original (not rounded) value should be used for any additional required calculations. Acceptance criteria are fixed numbers and are not rounded.

When rounding is required, consider only one digit in the decimal place to the right of the last place in the limit expression. If this digit is smaller than 5, it is eliminated and the preceding digit is unchanged. If this digit is equal to or greater than 5, it is eliminated and the preceding digit is increased by 1.

Change to read:**8. TERMS AND DEFINITIONS****8.10. Abbreviations**

- RS refers to a USP Reference Standard.
- CS refers to a Colorimetric Solution.
- TS refers to a Test Solution.
- VS refers to a Volumetric Solution that is standardized in accordance with directions given in the individual monograph or in the *Reagents, Indicators, and Solutions* section of USP-NF.

8.20. About

"About" indicates a quantity within 10%.

If the measurement is stated to be "accurately measured" or "accurately weighed," follow the statements in *Volumetric Apparatus* (31) and *Balances* (41), respectively.

8.30. Alcohol Content

Percentages of alcohol, such as those under the heading *Alcohol Content*, refer to percentage by volume of C_2H_5OH at 15.56°. Where a formula, test, or assay calls for alcohol, ethyl alcohol, or ethanol, the USP monograph article Alcohol

**Illustration of Rounding Numerical Values
for Comparison with Requirements**

Compendial Requirement	Unrounded Value	Rounded Result	Conforms
Assay limit $\geq 98.0\%$	97.96%	98.0%	Yes
	97.92%	97.9%	No
	97.95%	98.0%	Yes
Assay limit $\leq 101.5\%$	101.55%	101.6%	No
	101.46%	101.5%	Yes
	101.45%	101.5%	Yes

	0.015%	0.02%	Yes
	0.027%	0.03%	No
Limit test ≤ 3 ppm	3.5 ppm	4 ppm	No
	3.4 ppm	3 ppm	Yes
	2.5 ppm	3 ppm	Yes

afroozpharma@yahoo.com

shall be used. Where reference is made to " C_2H_5OH ," absolute (100 percent) ethanol is intended. Where a procedure calls for dehydrated alcohol, alcohol absolute, or anhydrous alcohol, the USP monograph article Dehydrated Alcohol shall be used.

8.40. Atomic Weights

Atomic weights used in computing molecular weights and the factors in the assays and elsewhere are those established by the IUPAC Commission on Isotopic Abundances and Atomic Weights. ▲ USP40

8.50. Blank Determinations

Where it is directed that "any necessary correction" be made by a blank determination, the determination shall be conducted using the same quantities of the same reagents treated in the same manner as the solution or mixture containing the portion of the substance under assay or test, but with the substance itself omitted.

8.60. Concomitantly

"Concomitantly" denotes that the determinations or measurements are to be performed in immediate succession.

8.70. Desiccator

The instruction "in a desiccator" indicates use of a tightly closed container of suitable size and design that maintains an atmosphere of low moisture content by means of a suitable desiccant such as anhydrous calcium chloride, magnesium perchlorate, phosphorus pentoxide, or silica gel. See also section 8.220 *Vacuum Desiccator*.

8.80. Logarithms

Logarithms are to the base 10.

8.90. Microbial Strain

A microbial strain cited and identified by its American Type Culture Collection (ATCC) catalog number shall be used directly or, if subcultured, shall be used not more than five passages removed from the original strain.

8.100. Negligible

"Negligible" indicates a quantity not exceeding 0.50 mg.

8.110. NLT/NMT

"NLT" means "not less than." "NMT" means "not more than."

8.120. Odor

"Odorless," "practically odorless," "a faint characteristic odor," and variations thereof indicate evaluation of a suitable quantity of freshly opened material after exposure to the air for 15 minutes. An odor designation is descriptive only and should not be regarded as a standard of purity for a particular lot of an article.

8.130. Percent

"Percent" used without qualification means:

- For mixtures of solids and semisolids, percent weight in weight;
- For solutions or suspensions of solids in liquids, percent weight in volume;
- For solutions of liquids in liquids, percent volume in volume;
- For solutions of gases in liquids, percent weight in volume.

For example, a 1 percent solution is prepared by dissolving 1 g of a solid or semisolid, or 1 mL of a liquid, in sufficient solvent to make 100 mL of the solution.

8.140. Percentage Concentrations

Percentage concentrations are expressed as follows:

- **Percent Weight in Weight (w/w)** is defined as the number of g of a solute in 100 g of solution.
- **Percent Weight in Volume (w/v)** is defined as the number of g of a solute in 100 mL of solution.
- **Percent Volume in Volume (v/v)** is defined as the number of mL of a solute in 100 mL of solution.

8.150. Pressure

Pressure is determined by use of a suitable manometer or barometer calibrated in terms of the pressure exerted by a column of mercury of the stated height.

8.160. Reaction Time

Reaction time is 5 minutes unless otherwise specified.

8.170. Specific Gravity

Specific gravity is the weight of a substance in air at 25° divided by the weight of an equal volume of water at the same temperature.

8.180. Temperatures

Temperatures are expressed in centigrade (Celsius) degrees, and all measurements are made at 25° unless otherwise indicated. Where moderate heat is specified, any temperature not higher than 45° (113° F) is indicated.

8.190. Time

Unless otherwise specified, rounding rules, as described in section 7.20 *Rounding Rules*, apply to any time specified.

8.200. Transfer

"Transfer" indicates a quantitative manipulation.

8.210. Vacuum

"Vacuum" denotes exposure to a pressure of less than 20 mm of mercury (2.67 kPas), unless otherwise indicated.

8.220. Vacuum Desiccator

"Vacuum desiccator" indicates a desiccator that maintains a low-moisture atmosphere at a reduced pressure of not more than 20 mm of mercury (2.67 kPas) or at the pressure designated in the individual monograph.

8.230. Water**8.230.10. Water as an Ingredient in an Official Product**

As an ingredient in an official product, water meets the requirements of the appropriate water monograph in USP or NF.

8.230.20. Water in the Manufacture of Official Substances

When used in the manufacture of official substances, water shall meet the requirements for drinking water as set forth in the U.S. Environmental Protection Agency National Primary Drinking Water Regulations or in the drinking water regulations of the European Union or of Japan, or in the World Health Organization's Guidelines for Drinking Water Quality. Additional specifications may be required in monographs.

8.230.30. Water in a Compendial Procedure

When water is called for in a compendial procedure, the USP article Purified Water shall be used unless otherwise specified. Definitions for other types of water are provided in *Reagents, Indicators, and Solutions* and in *Water for Pharmaceutical Purposes* (1231).

8.240. Weights and Measures

In general, weights and measures are expressed in the International System of Units (SI) as established and revised by the *Conférence générale des poids et mesures*. For compendial purposes, the term "weight" is considered to be synonymous with "mass."

Molality is designated by the symbol *m* preceded by a number that represents the number of moles of the designated solute contained in 1 kilogram of the designated solvent.

Molarity is designated by the symbol *M* preceded by a number that represents the number of moles of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

Normality is designated by the symbol *N* preceded by a number that represents the number of equivalents of the designated solute contained in an amount of the designated solvent that is sufficient to prepare 1 liter of solution.

The symbol for degrees (°) without a qualifying unit of measure represents degrees Celsius.

Chart of Symbols and Prefixes commonly employed for SI metric units and other units:

	Units	Symbol	Notes
Length			
	meter	m	

afroozpharma@yahoo.com

	Units	Symbol	Notes
	centimeter	cm	
	millimeter	mm	
	micrometer	μm	Previously referred to as a micron
	nanometer	nm	Previously the symbol $\text{m}\mu$ (for millimicron) was used
	Ångström	Å	Equal to 0.1 nm
Mass			
	kilogram	kg	
	gram	g	
	milligram	mg	
			The symbol μg is used in the USP and NF to represent micrograms, but micrograms may be represented as "mcg" for labeling and prescribing purposes. The term "gamma," symbolized by γ , frequently is used to represent micrograms in biochemical literature.
	microgram	μg	
	nanogram	ng	
	picogram	pg	
			Also referred to as the unified atomic mass unit and is equal to 1/12 times the mass of the free carbon 12 atom.
	dalton	Da	
	kilodalton	kDa

9. PRESCRIBING AND DISPENSING**9.10. Use of Metric Units**

Prescriptions for compendial articles shall be written to state the quantity and/or strength desired in metric units unless otherwise indicated in the individual monograph (see also section 5.50.10 *Units of Potency [Biological]* above). If an amount is prescribed by any other system of measurement, only an amount that is the metric equivalent of the pre-

scribed amount shall be dispensed. Abbreviations for the terms "Units" or "International Units" shall not be used for labeling or prescribing purposes. Apothecary unit designations on labels and labeling shall not be used.

9.20. Changes in Volume

In the dispensing of prescription medications, slight changes in volume owing to variations in room temperatures may be disregarded.

10. PRESERVATION, PACKAGING, STORAGE, AND LABELING**10.10. Packaging and Storage**

All articles in *USP* or *NF* are subject to the packaging and storage requirements specified in *Packaging and Storage Requirements* (659), unless different requirements are provided in an individual monograph.

10.20. Labeling

All articles in *USP* or *NF* are subject to the labeling requirements specified in *Labeling* (7), unless different requirements are provided in an individual monograph.

Juniper Tar

DEFINITION

Juniper Tar is the empyreumatic volatile oil obtained from the woody portions of *Juniperus oxycedrus* L. (Fam. Pinaceae).

IDENTIFICATION

- **A.**
Sample solution: Shake 1 volume of Juniper Tar with 20 volumes of warm water, filter, and use the filtrate.
Analysis: To 5 mL of the cold *Sample solution* add a few drops of silver-ammonium nitrate TS.
Acceptance criteria: A black color is produced.
- **B.**
Sample solution: Shake 1 volume of Juniper Tar with 20 volumes of warm water, filter, and use the filtrate.
Analysis: To 5 mL of the *Sample solution* add a few drops of alkaline cupric tartrate TS, and heat the solution to boiling.
Acceptance criteria: A red precipitate is formed.

SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.950–1.055
- **REACTION:** The filtrate prepared for *Identification* test A is acid to litmus.

ROSIN OR ROSIN OILS

Sample solution: Triturate 1 mL of Juniper Tar with 15 mL of solvent hexane, and filter.

Analysis: Mix equal volumes of *Sample solution* and cupric acetate solution (10 mg/mL), shake vigorously, and allow the liquids to separate. Decant the solvent hexane layer into a test tube, and add an equal volume of ether.

Acceptance criteria: The liquid does not become dark green or blackish.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.

Kanamycin Injection

DEFINITION

Kanamycin Injection contains an amount of kanamycin sulfate equivalent to NLT 90.0% and NMT 115.0% of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$). It contains suitable buffers and preservatives.

IDENTIFICATION

A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Sample solution: 1 mg/mL of kanamycin from Injection in water

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, heated at 110° for 1 h and cooled immediately before use

Application volume: 10 μ L

Developing solvent system: 150 mg/mL of monobasic potassium phosphate in water

Spray reagent: 10 mg/mL of ninhydrin in butyl alcohol

Analysis: Proceed as directed in the chapter. Allow the spots to dry, and develop in a chamber previously equilibrated for 18 h with the *Developing solvent system*. Remove the plate from the chamber, and air-dry. Spray the plate with *Spray reagent*, and dry at 110° for 10 min.

Acceptance criteria: Meets the requirements

B. The retention time of the kanamycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: 0.115 N sodium hydroxide solution
System suitability solution: 20 μ g/mL of USP Amikacin RS and 8 μ g/mL of USP Kanamycin Sulfate RS in water

Standard solution: 8 μ g/mL of USP Kanamycin Sulfate RS in water

Sample solution: Nominally 6 μ g/mL of kanamycin from Injection in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Electrochemical

Mode: Integrated amperometric

Range: 300 nC

Output: 1 V full-scale

Electrodes

Indicator: Gold

Reference: pH silver-silver chloride

Waveform: See *Table 1*.

Table 1

Time (s)	Potential (V)	Integration
0.00	+0.04	—
0.30	+0.04	Begin
0.50	+0.04	End
0.51	+0.80	—
0.70	+0.80	—
0.71	-0.80	—
0.90	-0.80	—

Columns

Guard: Packing L47

Analytical: 4-mm \times 25-cm; packing L47

Flow rate: 0.5 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for kanamycin and amikacin are about 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 3 between kanamycin and amikacin, *System suitability solution*

Tailing factor: NMT 2, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Kanamycin Sulfate RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of kanamycin in the *Sample solution* (μ g/mL)

P = potency of kanamycin in USP Kanamycin Sulfate RS (μ g/mg)

F = conversion factor, 0.001 mg/ μ g

Acceptance criteria: 90.0%–115.0%

SPECIFIC TESTS

• **pH (791):** 3.5–5.0

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.67 USP Endotoxin Unit/mg of kanamycin

• **STERILITY TESTS (71):** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

• **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass.

• **USP REFERENCE STANDARDS (11)**

USP Amikacin RS

USP Endotoxin RS

USP Kanamycin Sulfate RS

Kanamycin Sulfate

582.58

D-Streptamine, O-3-amino-3-deoxy- α -D-glucopyranosyl(1 \rightarrow 6)-O-[6-amino-6-deoxy- α -D-glucopyranosyl(1 \rightarrow 4)]-2-deoxy-, sulfate (1:1) (salt); Kanamycin sulfate (1:1) (salt) [25389-94-0].

DEFINITION

Kanamycin Sulfate has a potency equivalent to NLT 750 μ g/mg of kanamycin ($C_{18}H_{36}N_4O_{11}$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL**, Sulfate (191): Meets the requirements
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Mobile phase: 0.115 N sodium hydroxide solution
System suitability solution: 20 μ g/mL of USP Amikacin RS and 8 μ g/mL of USP Kanamycin Sulfate RS in water
Standard solution: 8 μ g/mL of USP Kanamycin Sulfate RS in water

Sample solution: 8 μ g/mL of Kanamycin Sulfate in water

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: Pulsed amperometric electrochemical detector

Working electrode: Gold

Reference electrode: pH silver–silver chloride

Waveform: See Table 1.

0.70	+0.80	—
0.71	−0.80	—
0.90	−0.80	—

Columns

Guard: 4-mm \times 50-mm; 7.5- μ m packing L47

Analytical: 4-mm \times 25-cm; 7.5- μ m packing L47

Flow rate: 0.5 mL/min

Injection volume: 20 μ L

System suitability

[NOTE—The relative retention times for kanamycin and amikacin are about 1.0 and 1.3, respectively.]

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3 between kanamycin and amikacin, *System suitability solution*

Tailing factor: NMT 2, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the quantity, in μ g/mg, of kanamycin ($C_{18}H_{36}N_4O_{11}$) in the portion of Kanamycin Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

- r_U = peak area from the *Sample solution*
- r_S = peak area from the *Standard solution*
- C_S = concentration of USP Kanamycin Sulfate RS in the *Standard solution* (μ g/mL)
- C_U = concentration of Kanamycin Sulfate in the *Sample solution* (μ g/mL)
- P = potency of kanamycin in USP Kanamycin Sulfate RS (μ g/mg)

Acceptance criteria: NLT 750 μ g/mg on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281)

Analysis: Moisten the charred residue with 2 mL of nitric acid and 5 drops of sulfuric acid.

Acceptance criteria: NMT 1.0%

• ORGANIC IMPURITIES

Adsorbent: 0.25-mm layer of chromatographic silica gel

Developing solvent system: 75 mg/mL of monobasic potassium phosphate in water

Spray reagent: 10 mg/mL of ninhydrin in butyl alcohol

Standard solution 1: 30 mg/mL of USP Kanamycin Sulfate RS in water

Standard solution 2: 0.90 mg/mL of USP Kanamycin Sulfate RS in water

Sample solution: 30 mg/mL of Kanamycin Sulfate in water

Application volume: 1 μ L

Analysis: Heat the plate at 110° for 1 h immediately before use, and allow it to cool. Equilibrate for 90 min with the *Developing solvent system*.

Apply all three solutions to the plate separately, allow the spots to dry, and develop the chromatogram with the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, and air-dry.

Spray the plate with *Spray reagent*. Dry the plate at 110° for 10 min, and examine the chromatograms.

Acceptance criteria: The chromatograms show principal spots at the same R_f value, and no secondary spot, if present from the *Sample solution*, is more intense than the principal spot of *Standard solution 2*.

SPECIFIC TESTS

- **CRYSTALLINITY** (695): Meets the requirements

• pH (791)

Sample solution: 10 mg/mL

Acceptance criteria: 6.5–8.5

• LOSS ON DRYING (731)

Analysis: Dry 100 mg in a vacuum in a capillary-stoppered bottle at a pressure not exceeding 5 mm of mercury at 60° for 3 h.

Acceptance criteria: NMT 4.0%

- **STERILITY TESTS** (71): Where the label states that Kanamycin Sulfate is sterile, it meets the requirements when tested as directed for membrane filtration in *Test for Sterility of the Product to Be Examined*.

- **BACTERIAL ENDOTOXINS TEST** (85): Where the label states that Kanamycin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.67 USP Endotoxin Unit/mg of Kanamycin.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

• **USP REFERENCE STANDARDS** (11)

USP Amikacin RS
USP Endotoxin RS
USP Kanamycin Sulfate RS

Kanamycin Sulfate Capsules

DEFINITION

Kanamycin Sulfate Capsules contain the equivalent of NLT 90.0% and NMT 115.0% of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$).

IDENTIFICATION

• **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Sample solution: 1 mg/mL of kanamycin from Capsules in water

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture, heated at 110° for 1 h and cooled immediately before use

Application volume: 10 μ L

Developing solvent system: 150 mg/mL of monobasic potassium phosphate solution

Spray reagent: 10 mg/mL of ninhydrin in butyl alcohol

Analysis: Proceed as directed in the chapter. Allow the spots to dry, and develop in a suitable chamber, previously equilibrated for 18 h with the *Developing solvent system*. Remove the plate from the chamber, and air-dry. Spray the plate with *Spray reagent*, and dry at 110° for 10 min.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the kanamycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Mobile phase: 0.115 N sodium hydroxide solution

System suitability solution: 20 μ g/mL of USP Amikacin RS and 8 μ g/mL of USP Kanamycin Sulfate RS

Standard solution: 8 μ g/mL of USP Kanamycin Sulfate RS

Sample stock solution: Nominally 0.32 mg/mL of kanamycin, prepared as follows. Transfer a portion of the mixed contents of Capsules (NLT 10) to a suitable volumetric flask. Add water, using 20% of the final volume, and swirl to dissolve. Dilute with water to volume.

Sample solution: Nominally 6.4 μ g/mL of kanamycin from the *Sample stock solution* in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Electrochemical

Mode: Integrated amperometric

Range: 300 nC

Output: 1 V full-scale

Electrodes

Indicator: Gold

Reference: pH silver-silver chloride

Waveform: See *Table 1*.

Table 1

Time (s)	Potential (V)	Integration
0.00	+0.04	—

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Kanamycin Sulfate RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of kanamycin in the *Sample solution* (μ g/mL)

P = potency of kanamycin in USP Kanamycin Sulfate RS (μ g/mg)

F = conversion factor, 0.001 mg/ μ g

Acceptance criteria: 90.0%–115.0%

PERFORMANCE TESTS

- **DISSOLUTION, Procedure for a Pooled Sample** (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: USP Kanamycin Sulfate RS in *Medium*

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Analysis: Determine the percentage of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$) dissolved by using the procedure described in the *Assay*, making any necessary modifications.

Tolerances: NLT 75% (Q) of the labeled amount of kanamycin ($C_{18}H_{36}N_4O_{11}$) is dissolved.

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Sample: 100 mg

Analysis: Dry the *Sample* in a capillary-stoppered bottle under vacuum at 60° for 3 h.

Acceptance criteria: NMT 4.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Amikacin RS
USP Kanamycin Sulfate RS

Kaolin

DEFINITION

Kaolin is a native hydrated aluminum silicate, powdered and freed from gritty particles by elutriation.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Aluminum (191)**

Sample solution: Mix 1 g of Kaolin with 10 mL of water and 5 mL of sulfuric acid in a porcelain dish. Evaporate the mixture until the excess water is removed, and continue heating the residue until dense, white fumes of sulfur trioxide appear. Cool, cautiously add 20 mL of water, boil for a few min, and filter.

Acceptance criteria: A gray residue (impure silica) remains on the filter, and the filtrate meets the requirements of the test.

IMPURITIES

- **LOSS ON IGNITION (733)**

Analysis: Ignite between 550° and 600°.

Acceptance criteria: NMT 15.0%

- **LEAD (251)**

Test preparation: Transfer 1.0 g of Kaolin to a centrifuge tube, add 10 mL of 1 N nitric acid, and digest for 1 h in a boiling water bath. Centrifuge until the solids are completely separated, and pour the supernatant into a 100-mL volumetric flask. Add 5 mL of 1 N nitric acid, and digest for 15 min in a boiling water bath. Centrifuge, and add the supernatant to the previous extract in the volumetric flask. Dilute with water to volume.

Analysis: Proceed as directed in the chapter, using a 50-mL portion of this solution, 3 mL of *Ammonium Citrate Solution*, 500 µL of *Hydroxylamine Hydrochloride Solution*, and 1 mL of *Potassium Cyanide Solution*.

Acceptance criteria: NMT 5 µg of lead (NMT 10 ppm)

- **IRON**

Sample: 2.0 g

Analysis: Triturate the *Sample* in a mortar with 10 mL of water, and add 0.50 g of sodium salicylate.

Acceptance criteria: The mixture does not acquire more than a slight reddish tint.

- **ACID-SOLUBLE SUBSTANCES**

Sample: 1.0 g

Analysis: Digest the *Sample* with 20 mL of 3 N hydrochloric acid for 15 min, and filter.

Acceptance criteria: NMT 2.0%; 10 mL of the filtrate, evaporated to dryness and ignited, leaves NMT 10 mg of residue.

- **CARBONATE**

Sample: 1.0 g

Analysis: Mix the *Sample* with 10 mL of water and 5 mL of sulfuric acid.

Acceptance criteria: No effervescence occurs.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Ketamine Hydrochloride

$C_{13}H_{16}ClNO \cdot HCl$ 274.19

Cyclohexanone, 2-(2-chlorophenyl)-2-(methylamino)-, hydrochloride.

(±)-2-(o-Chlorophenyl)-2-(methylamino)cyclohexanone hydrochloride [1867-66-9].

» Ketamine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{13}H_{16}ClNO \cdot HCl$.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Ketamine Hydrochloride RS

USP Ketamine Related Compound A RS

1-[(2-Chlorophenyl)(methylimino)methyl]cyclopentanol.
 $C_{13}H_{16}NOCl$ 237.73

Clarity and color of solution—Dissolve 1 g in 5 mL of water; the solution is clear and colorless.

Identification—

A: Infrared Absorption (197K)—Do not dry specimens.

B: Acid solvent—The UV absorption spectrum of a solution in 0.1 N hydrochloric acid (1 in 3000) exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Ketamine Hydrochloride RS, concomitantly measured, and the respective absorptivities, at the wavelengths of maximum absorbance at about 269 and 276 nm, do not differ by more than 3.0%.

Basic solvent—The UV absorption spectrum of a solution in 0.01 N sodium hydroxide (1 in 1250), in a mixture of water and methanol (1 in 20), exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Ketamine Hydrochloride RS, concomitantly measured, and the respective absorptivities, at the wavelength of maximum absorbance at about 302 nm, do not differ by more than 3.0%.

pH (791): between 3.5 and 4.1, in a solution (1 in 10).

Residue on ignition (281): not more than 0.1%.

Delete the following:

- **Heavy metals, Method I (231):** 0.002%. • (Official 1-Jan-2018)

Related compounds—

Mobile phase—Dissolve 0.95 g of sodium 1-hexanesulfonate in 1 L of a solution consisting of a mixture of water and acetonitrile (3:1). Add 4 mL of acetic acid, and mix.

Standard solution—Dissolve accurately weighed quantities of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS in *Mobile phase* (sonicate if necessary) to prepare a solution containing about 0.005 mg per mL of each compound. Prepare immediately before use.

Test solution—Transfer an accurately weighed quantity of about 50.0 mg of Ketamine Hydrochloride to a 50-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, sonicating if necessary.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.0-mm × 4.0-mm guard column with a 4.0-mm × 12.5-cm analytical column that contains 5-µm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph

the *Standard solution*, and record the peak responses as directed for *Procedure*: the order of elution is ketamine hydrochloride followed by ketamine related compound A; the resolution, R , between these two peaks is not less than 2.0; the retention time of ketamine hydrochloride is between 3.0 and 4.5 minutes (if necessary, adjust the concentration of water and acetonitrile); and the tailing factor is not greater than 1.5.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, identify the ketamine hydrochloride and ketamine related compound A peaks, and measure the areas of the major peaks. Calculate the area percentage of each impurity, relative to ketamine hydrochloride, in the portion of Ketamine Hydrochloride taken by the formula:

$$5000(C/W)(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard solution*; W is the weight, in mg, of Ketamine Hydrochloride taken to prepare the *Test solution*; r_i is the peak area of each individual impurity peak in the *Test solution*; and r_s is the response of the ketamine hydrochloride peak obtained from the *Standard solution*. Not more than 0.1% of ketamine related compound A is found; the response of no other unknown impurity is greater than 0.3% of the ketamine peak area; and the sum of the responses of all unknown impurity peaks is not greater than 1.0% of the ketamine peak response.

Assay—

Buffer—Dissolve 5.75 g of monobasic ammonium phosphate in 1000 mL of water. Add 6 mL of triethylamine, and adjust with phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of *Buffer* and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Transfer about 12.5 mg each, of USP Ketamine Hydrochloride RS and USP Ketamine Related Compound A RS, both accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase* with the aid of sonification if necessary, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Standard preparation—Transfer about 10 mg of USP Ketamine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add about 20 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 20 mg of Ketamine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add about 35 mL of *Mobile phase*, and sonicate to dissolve. Dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the order of elution is ketamine followed by ketamine related compound A; the resolution, R , between ketamine and ketamine related compound A is not less than 2.0; the column efficiency determined from the ketamine peak is not less than 9400 theoretical plates; and the tailing factor determined from the ketamine peak is not more than 1.6. Chromatograph the *Standard preparation*, and record the ketamine peak response as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 0.6%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{13}H_{16}ClNO \cdot HCl$ in the portion of Ketamine Hydrochloride taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Ketamine Hydrochloride RS in the *Standard preparation*; and r_u and r_s are the ketamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Ketamine Hydrochloride Injection

» Ketamine Hydrochloride Injection is a sterile solution of Ketamine Hydrochloride in Water for Injection. It contains an amount of ketamine hydrochloride ($C_{13}H_{16}ClNO \cdot HCl$) equivalent to not less than 95.0 percent and not more than 105.0 percent of the labeled amount of ketamine ($C_{13}H_{16}ClNO$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light and heat.

USP Reference standards (11)—

USP Endotoxin RS

USP Ketamine Hydrochloride RS

Identification—

A: The UV absorption spectrum, measured in the region between 250 and 350 nm, of a dilution of Injection in 0.01 N methanolic sodium hydroxide containing ketamine hydrochloride equivalent to about 800 μ g of ketamine per mL, exhibits maxima and minima at the same wavelengths as that of a similar preparation of USP Ketamine Hydrochloride RS, concomitantly measured.

B: The UV absorption spectrum of the solution employed for measurement of absorbance of the assay solution, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of the *Standard solution*, prepared as directed in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.4 USP Endotoxin Unit per mg of ketamine hydrochloride.

pH (791): between 3.5 and 5.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of ketamine hydrochloride, to a 200-mL volumetric flask, dilute with water to volume, and mix. Transfer 20.0 mL of this solution to a 125-mL separator, add 3 mL of 0.1 N sodium hydroxide, and extract with three 15-mL portions of chloroform. Collect the chloroform extracts in a second 125-mL separator, and extract with three 30-mL portions of 0.1 N sulfuric acid, collecting the acid extracts in a 200-mL volumetric flask. Dilute with 0.1 N sulfuric acid (saturated with chloroform) to volume, and mix. Concomitantly determine the absorbances of this solution and a *Standard solution* of USP Ketamine Hydrochloride RS in the same medium having a known concentration of about 250 μ g per mL, in 1-cm cells at the wavelength of maximum absorbance at about 269 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid (saturated with chloroform) as the blank. Calculate the quantity,

in mg, of ketamine ($C_{13}H_{16}ClNO$) in each mL of the Injection taken by the formula:

$$(237.73 / 274.19)(2C / V)(A_U / A_S)$$

in which 237.73 and 274.19 are the molecular weights of ketamine and ketamine hydrochloride, respectively; C is the concentration, in μg per mL, of USP Ketamine Hydrochloride RS in the Standard solution; V is the volume, in mL, of Injection taken; and A_U and A_S are the absorbances of the solution from the Injection and the Standard solution, respectively.

Ketoconazole

$C_{26}H_{28}Cl_2N_4O_4$ 531.43
Piperazine, 1-acetyl-4-[4-[[2-(2,4-dichlorophenyl)-2-(1H-imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl]-, *cis*-;
(±)-*cis*-1-Acetyl-4-(p-[[2-(2,4-dichlorophenyl)-2-(imidazol-1-ylmethyl)-1,3-dioxolan-4-yl]methoxy]phenyl)piperazine [65277-42-1].

DEFINITION

Ketoconazole contains NLT 98.0% and NMT 102.0% of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 3.4 mg/mL of tetrabutyl ammonium hydrogen sulfate in water
Solution A: Acetonitrile and Buffer (5:95)
Solution B: Acetonitrile and Buffer (50:50)
Mobile phase: See Table 1.

Ketoconazole Compounded Oral Suspension

DEFINITION

Ketoconazole Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$).

Prepare Ketoconazole Compounded Oral Suspension 20 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Ketoconazole	2.0 g
Cetylpyridinium Chloride	10 mg
Xanthan Gum	0.15 g
Purified Water	30 mL
Suspension Structured Vehicle or Sugar-Free Suspension Structured Vehicle, a sufficient quantity to make	100 mL

Place the required number of tablets in a glass mortar, and comminute to a fine powder such that they pass through a 40-mesh or 45-mesh sieve, or add Ketoconazole powder to the mortar. Dissolve the Cetylpyridinium Chloride in Purified Water, and dilute quantitatively, and stepwise if necessary, with Purified Water to obtain 10 mL of a solution containing 10 mg of Cetylpyridinium Chloride. Transfer this solution, in divided portions, to the mortar containing the powder, and mix to form a smooth paste. Place 20 mL of Purified Water in a beaker. Using moderate heat, stir to form a vortex, and slowly sprinkle the Xanthan Gum into the vortex to obtain a uniform dispersion. Add the dispersion to the wetted powder paste, and mix until smooth. Add a sufficient quantity of the Suspension Structured Vehicle or Sugar-Free Suspension Structured Vehicle to bring to final volume. Mix well.

ASSAY• **PROCEDURE**

Mobile phase: Acetonitrile and 0.01 M tetrabutylammonium hydrogen sulfate (25:75). Pass through a filter of 5- μ m or finer pore size, and degas.

Diluent: Methanol and water (50:50)

System suitability solution: Dissolve 4 mg of USP Ketoconazole RS in 1.0 mL of a solution of potassium sorbate in water (1 in 5000). Dilute with Diluent to 10.0 mL.

Standard solution: 0.4 mg/mL of USP Ketoconazole RS in Diluent

Sample solution: [NOTE—If the Oral Suspension has settled, invert the container 10–15 times, and sonicate for 5 min, or stir on a magnetic stirrer until the Oral Suspension appears homogeneous. Examine the mixture for the presence of bubbles and unsuspended solids before sampling.] Transfer 5.0 mL of homogeneous Oral Suspension to a 250-mL volumetric flask, add 100 mL of water, and stir for 15 min to dissolve the xanthan gum. Add 135 mL of methanol, and stir for an additional 15 min. Cool, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 223 nm

Columns

Guard: 5- μ m packing L1

Analytical: 4.6-mm \times 25-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 5 μ L

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for ketoconazole and sorbate are 1.0 and 1.7, respectively.]

Suitability requirements

Resolution: NLT 2.0 between sorbate and ketoconazole, System suitability solution

Relative standard deviation: NMT 2.0% for replicate injections, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Ketoconazole RS in the Standard solution (mg/mL)

C_U = nominal concentration of ketoconazole in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.• **BEYOND-USE DATE:** NMT 14 days after the date on which it was compounded when stored at controlled room temperature• **LABELING:** Label it to state that it is to be well shaken before use, and that it is to be protected from light. Label it to state the Beyond-Use Date.• **USP REFERENCE STANDARDS (11)**

USP Ketoconazole RS

Ketoconazole Tablets

DEFINITION

Ketoconazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$).

IDENTIFICATION• **A.**

Standard solution: 1 mg/mL of USP Ketoconazole RS in chloroform

Sample solution: Nominally 1 mg/mL of ketoconazole in chloroform prepared as follows. Transfer a quantity of finely powdered Tablets, equivalent to 50 mg of ketoconazole, to a suitable flask. Add 50 mL of chloroform, shake for 2 min, and filter.

Chromatographic system

(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: *n*-Hexane, ethyl acetate, methanol, glacial acetic acid, and water (42:40:15:1:2)

Analysis: Allow the spots to dry, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and view under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY

• PROCEDURE

Solution A: Diisopropylamine in methanol (1 in 500)

Solution B: 5 mg/mL of ammonium acetate in water

Mobile phase: *Solution A* and *Solution B* (7:3)

Diluent: Methanol and methylene chloride (1:1)

Internal standard solution: 5 mg/mL of USP Terconazole RS in *Diluent*

Standard solution: 0.4 mg/mL of USP Ketoconazole RS in *Diluent* prepared as follows. Transfer 20 mg of USP Ketoconazole RS to a 50-mL volumetric flask. Add 5.0 mL of *Internal standard solution*, and dilute with *Diluent*.

Sample stock solution: Nominally 4 mg/mL of ketoconazole in *Diluent* prepared as follows. Weigh and finely powder NLT 20 Tablets. Transfer the nominal equivalent to 200 mg of ketoconazole to a suitable screw-capped bottle. Add 50.0 mL of *Diluent*, shake by mechanical means for 30 min, and centrifuge.

Sample solution: Nominally 0.4 mg/mL of ketoconazole in *Diluent* prepared as follows. Transfer 5.0 mL of the clear supernatant so obtained from the *Sample stock solution* to a 50-mL volumetric flask. Add 5.0 mL of *Internal standard solution*, and dilute with *Diluent* to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 225 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 3 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for ketoconazole and terconazole are 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between ketoconazole and terconazole

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of ketoconazole to terconazole from the *Sample solution*

R_S = peak response ratio of ketoconazole to terconazole from the *Standard solution*

C_S = concentration of USP Ketoconazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ketoconazole in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Analytical wavelength: UV 270 nm

Standard solution: USP Ketoconazole RS in *Medium*

Sample solutions: Pass portions of the solution under test through a suitable filter of 0.45- μ m pore size, and dilute with *Medium* to a concentration similar to that of the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of ketoconazole ($C_{26}H_{28}Cl_2N_4O_4$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Ketoconazole RS

USP Terconazole RS

Ketoprofen

$C_{16}H_{14}O_3$

Benzeneacetic acid, 3-benzoyl- α -methyl-, (\pm); (\pm)-*m*-Benzoylhydratropic acid [22071-15-4].

254.28

DEFINITION

Ketoprofen contains NLT 98.5% and NMT 101.0% of $C_{16}H_{14}O_3$, calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. ULTRAVIOLET ABSORPTION (197U)

Analytical wavelength: 258 nm

Medium: Methanol and water (3:1)

Blank: *Medium*

Sample solution: 10 μ g/mL in *Medium*

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

• PROCEDURE

Sample: 450 mg

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 25 mL of alcohol. Add 25 mL of water and several drops of phenol red TS.

Perform a blank determination. Each mL of *Titrant* is equivalent to 25.43 mg of $C_{16}H_{14}O_3$. [NOTE—Standardize the 0.1 N sodium hydroxide by a similar titration of primary standard benzoic acid.]

Acceptance criteria: 98.5%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%

Delete the following:

- **HEAVY METALS**, Method II (231): NMT 0.002% (Official 1: Jan-2018)

ORGANIC IMPURITIES

[NOTE—Protect the solutions from light.]

Buffer: 68 g/L of monobasic potassium phosphate in water, and adjust with phosphoric acid to a pH of 3.5 ± 0.05

Mobile phase: Acetonitrile, water, and Buffer (43:55:2)

System suitability solution: 5 µg/mL of USP

Ketoprofen RS and 1.5 µg/mL of USP Ketoprofen Related Compound D RS in *Mobile phase*

Standard solution: 0.002 mg/mL of USP Ketoprofen RS in *Mobile phase*

Sample solution: 1 mg/mL of Ketoprofen in *Mobile phase*

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 233 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

Run time: Seven times the retention time for Ketoprofen

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for ketoprofen and ketoprofen related compound D (3-acetylbenzophenone) are about 1.0 and 1.6, respectively.]

Suitability requirements

Resolution: NLT 7.0 between ketoprofen related compound D and ketoprofen, *System suitability solution*

Column efficiency: NLT 2250 theoretical plates from ketoprofen, *System suitability solution*

Tailing factor: NMT 2.0 for ketoprofen, *System suitability solution*

Relative standard deviation: NMT 5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Ketoprofen taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of impurity from the *Sample solution*

r_S = peak response of ketoprofen from the *Standard solution*

C_S = concentration of USP Ketoprofen RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria

Any individual impurity: NMT 0.2%

Total impurities: NMT 1.0%

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE**, Procedure for Class I (741): 92.0°–97.0°

- **OPTICAL ROTATION**, Specific Rotation (781S)

Sample solution: 10 mg/mL, in dehydrated alcohol

Acceptance criteria: +1° to –1°

- **LOSS ON DRYING** (731): Dry a sample in a vacuum at 60° for 4 h; it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
 - USP Ketoprofen RS
 - USP Ketoprofen Related Compound D RS
 - 3-Acetylbenzophenone.

Ketoprofen Capsules

DEFINITION

Ketoprofen Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Sample solution: Shake a quantity of the contents of the Capsules containing 50 mg of ketoprofen with 5 mL of chloroform for 5 min, filter, and evaporate to dryness using a rotary evaporator.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

- **PROCEDURE**

The *Standard solution* and *Sample solution* must be protected from light.

Mobile phase: Acetonitrile, glacial acetic acid, and water (90:1:10)

System suitability stock solution: 0.25 mg/mL of USP Ketoprofen RS and 0.5 mg/mL of USP Ketoprofen Related Compound A RS in *Mobile phase*

System suitability solution: 0.02 mg/mL of USP Ketoprofen RS and 0.04 mg/mL of USP Ketoprofen Related Compound A RS in *Mobile phase* from *System suitability stock solution*

Standard stock solution: 0.24 mg/mL of USP Ketoprofen RS in *Mobile phase*

Standard solution: 0.024 mg/mL of USP Ketoprofen RS in *Mobile phase* from *Standard stock solution*

Sample solution: Nominally 0.024 mg/mL of ketoprofen in *Mobile phase* prepared as follows. Remove completely the contents of NLT 20 Capsules, and transfer a quantity of the contents, equivalent to 200 mg of ketoprofen, to a 250-mL volumetric flask. Add 150 mL of *Mobile phase*, stir for 2 h, then dilute with *Mobile phase* to volume. Centrifuge a portion of the preparation. Pipet 3.0 mL of clear supernatant into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.2 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between ketoprofen and ketoprofen related compound A, *System suitability solution*

Tailing factor: NMT 1.5 for the ketoprofen peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Ketoprofen RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of ketoprofen in the *Sample solution* (mg/mL)
Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

The *Standard solution* and *Sample solution* must be protected from light.

Medium: 0.05 M phosphate buffer, pH 7.4; 1000 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: USP Ketoprofen RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration similar to that of the *Standard solution*.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 260 nm

Cell path length: 1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

A_U = absorbance from the *Sample solution*
 A_S = absorbance from the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)
 L = label claim (mg/Capsule)
 D = dilution factor of the *Sample solution*
 V = volume of *Medium*, 1000 mL

Tolerances: NLT 80% (Q) of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$) is dissolved.

IMPURITIES**• ORGANIC IMPURITIES**

The *System suitability solution*, *Standard solution*, and *Sample solution* must be protected from light.

Buffer: 68.0 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.5 \pm 0.05.

Mobile phase: Acetonitrile, water, and *Buffer* (43:55:2)

Diluent: Acetonitrile and water (2:3)

System suitability solution: 5 μ g/mL of USP Ketoprofen RS and 1.5 μ g/mL of USP Ketoprofen Related Compound D RS in *Diluent*

Standard solution: 2 μ g/mL of USP Ketoprofen RS, 2 μ g/mL of USP Ketoprofen Related Compound C RS, and 3 μ g/mL of USP Ketoprofen Related Compound D RS in *Diluent*

Sample solution: Nominally 1 mg/mL of ketoprofen in *Mobile phase*

Ketoprofen Extended-Release Capsules**DEFINITION**

Ketoprofen Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of ketoprofen ($C_{16}H_{14}O_3$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- B. ULTRAVIOLET ABSORPTION (197):** The UV spectrum from the *Sample solution* in the *Analysis* for the *Dissolution* section corresponds to the spectrum from the *Standard solution*.

ASSAY**PROCEDURE**

[NOTE—Protect the *Standard solution* and *Sample solution* from light.]

Mobile phase: Acetonitrile, water, and glacial acetic acid (90:110:1)

Standard stock solution: 0.24 mg/mL of USP Ketoprofen RS in *Mobile phase*

Standard solution: 0.024 mg/mL of USP Ketoprofen RS in *Mobile phase*, from the *Standard stock solution*

System suitability solution: 0.25 mg/mL of USP Ketoprofen RS and 0.5 mg/mL of USP Ketoprofen Related Compound A RS in *Mobile phase*. Pipet 4.0 mL of this solution into a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Remove completely the contents of NLT 20 Capsules, and transfer a quantity of the beads, equal to 200 mg of ketoprofen, to a 250-mL volumetric flask. Add 150 mL of *Mobile phase* and mix; bring to volume. Centrifuge, and pipet 3.0 mL of clear supernatant that contains about 2.4 mg of ketoprofen into a 100-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection size: 20 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between ketoprofen and ketoprofen related compound A, *System suitability solution*

Tailing factor: NMT 1.5 for the ketoprofen peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{16}H_{14}O_3$ in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Ketoprofen RS in the *Standard solution* (mg/mL)

C_U = concentration of ketoprofen in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**DISSOLUTION (711)**

Medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 50 rpm

Time: 1, 4, and 8 h

Detector: UV 258 nm

Standard solution: About 0.1 mg/mL of USP Ketoprofen RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 10-μm pore size, then

pass the filtrate through a suitable filter of 0.45-μm pore size.

Capsules labeled to contain 200 mg: In a test tube, dilute 5.0 mL of filtrate with 5.0 mL of *Medium*.

Capsules labeled to contain 150 mg: In a test tube, dilute 6.0 mL of filtrate with 3.0 mL of *Medium*.

Capsules labeled to contain 100 mg: No dilution is necessary.

Capsule blank: Place 10 empty, clean Capsules of the appropriate dosage into a 1000-mL volumetric flask. Add about 800 mL of *Medium* at 37°. Stir until Capsule shells are disintegrated. After equilibration to room temperature, dilute with *Medium* to volume. Transfer 100.0 mL to a 1000-mL volumetric flask, and dilute with *Medium* to volume. Pass through a suitable filter of 10-μm pore size, then pass the filtrate through a suitable filter of 0.45-μm pore size.

Capsules labeled to contain 200 mg: In a flask, dilute 25.0 mL with 25.0 mL of *Medium*.

Capsules labeled to contain 150 mg: In a flask, dilute 30.0 mL with 15.0 mL of *Medium*.

Capsules labeled to contain 100 mg: No dilution is necessary.

Analysis

Samples: *Standard solution*, *Sample solution*, and *Capsule blank*, using *Medium* as the blank

Calculate the concentration, in mg/mL, of ketoprofen in the sample withdrawn at each time point:

$$\text{Result} = (A_U - A_{CB}) \times (C_S/A_S)$$

A_U = absorbance of the *Sample solution*

A_{CB} = absorbance of the *Capsule blank*

C_S = concentration of USP Ketoprofen RS in the *Standard solution* (mg/mL)

A_S = absorbance of the *Standard solution*

Calculate the percentage of ketoprofen dissolved at each time point:

$$\text{Result} = (D + \Sigma R) \times 100/L$$

D = [amount dissolved (mg)] = volume (mL) remaining before draw × concentration (mg/mL) of sample withdrawn at the sampling time point

R = [amount removed (mg)] = volume (mL) of sample withdrawn × concentration (mg/mL) of sample withdrawn at each time point

100 = conversion factor for percentage

L = Capsule label claim (mg)

Tolerances: The percentage of the labeled amount of ketoprofen released at the times specified conforms to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	10%–25%
4	55%–80%
8	NLT 80%

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

Procedure for content uniformity: [NOTE—Protect the *Standard solution* and *Sample solution* from light.]

Mobile phase, Standard solution, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

Sample solution: Transfer the contents of 10 Capsules, 1 Capsule each, to each of 10 250-mL volumetric flasks, add about 150 mL of *Mobile phase* to each flask, and stir for 2 h. Dilute with *Mobile phase* to volume, and mix. Centrifuge, and pipet a volume of clear supernatant that contains about 2.4 mg of ketoprofen into a

100-mL volumetric flask. Dilute with *Mobile phase* to volume.

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between ketoprofen and ketoprofen related compound A, *System suitability solution*

Tailing factor: NMT 1.5 for the ketoprofen peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{16}H_{14}O_3$ in each Capsule:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Ketoprofen RS in the *Standard solution* (mg/mL)
 C_U = concentration of ketoprofen in the *Sample solution* (mg/mL)

 (\pm)-5-Benzoyl-2,3-dihydro-1*H*-pyrrolizine-1-carboxylic acid, compound with 2-amino-2-(hydroxymethyl)-1,3-propanediol (1:1) [74103-07-4].

DEFINITION

Ketorolac Tromethamine contains NLT 98.5% and NMT 101.5% of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Delete the following:

- **B. ULTRAVIOLET ABSORPTION (197U)**

Sample solution: 10 μ g/mL

Medium: Methanol

Acceptance criteria: Meets the requirements (IRA 1-May-2016)

Add the following:

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*. (IRA 1-May-2016)

- **C. THIN-LAYER CHROMATOGRAPHY, Tromethamine Test**

Diluent: Dichloromethane and methanol (2:1)

Standard solution: 5 mg/mL of USP Ketorolac Tromethamine RS in *Diluent*

Sample solution: 5 mg/mL of Ketorolac Tromethamine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 40 μ L

Developing solvent system: Dichloromethane, acetone, and glacial acetic acid (95:5:2)

Spray reagent: Freshly prepared alcoholic solution containing 30 mg/mL of ninhydrin

Analysis

Samples: *Standard solution* and *Sample solution*
 Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. Spray the plate with *Spray reagent*, and heat the plate at about 150° for 2–5 min.

Acceptance criteria: Yellow spots with pink to purple borders develop on the plate in the areas where the *Standard solution* and the *Sample solution* were applied.

ASSAY

- **PROCEDURE**

Protect all the solutions from light.

Buffer: 5.75 g/L of monobasic ammonium phosphate. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Tetrahydrofuran and *Buffer* (30:70)

Diluent: Tetrahydrofuran and water (30:70)

System suitability solution: In a 250-mL separator, mix 100 mL of water, 100 mL of dichloromethane, 30 mg of USP Ketorolac Tromethamine RS, and 1 mL of 1 N hydrochloric acid. Insert the stopper, shake, and allow the layers to separate. Transfer the lower dichloromethane layer to a stoppered borosilicate glass flask, and discard the upper layer. Expose the dichloromethane solution to direct sunlight for 10–15 min. Transfer 1.0 mL of the solution to a vial, evaporate in a current of air or in a stream of nitrogen to dryness, add 1.0 mL of *Diluent*, and swirl to dissolve. [NOTE—This solution may be stored under refrigeration and used as long as the chromatogram obtained as directed for *Analysis* is suitable for identifying the peaks due to the ketorolac 1-keto analog and ketorolac 1-hydroxy analog, and for the measurement of the resolution between the ketorolac 1-keto analog and ketorolac.]

Standard solution: 0.4 mg/mL of USP Ketorolac Tromethamine RS in *Diluent*

Sample solution: 0.4 mg/mL of Ketorolac Tromethamine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 313 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for the ketorolac 1-hydroxy analog, the ketorolac 1-keto analog, and ketorolac are about 0.63, 0.89, and 1.0, respectively.]

Make adjustments, if necessary, to achieve a retention time for ketorolac of about 8–12 min.]

Suitability requirements

Resolution: NLT 1.5 between ketorolac 1-keto analog and ketorolac, *System suitability solution*

Column efficiency: NLT 5500 theoretical plates, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$) in the portion of Ketorolac Tromethamine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area from the *Sample solution*

r_S = peak area from the *Standard solution*

C_S = concentration of USP Ketorolac Tromethamine RS in the *Standard solution* (mg/mL)

C_U = concentration of Ketorolac Tromethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 313 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

Run time: 3 times the retention time of ketorolac

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Ketorolac Tromethamine taken:

$$\text{Result} = (r_U/r_T) \times F \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_T = sum of all the peak responses from the *Sample solution*

F = relative response factor (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity having a 0.54 relative retention time	0.54	2.2	0.5
Ketorolac 1-hydroxy analog	0.63	0.67	0.1

Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity having a 0.66 relative retention time	0.66	0.91	0.5
Ketorolac 1-keto analog	0.89	0.52	0.1
• Individual unspecified impurity	—	1.0	0.5% (IHA 1-May-2016)
Ketorolac tromethamine	1.0	1.0	—
Total impurities	—	—	1.0

SPECIFIC TESTS

• pH (791)

Sample solution: 10 mg/mL

Acceptance criteria: 5.7–6.7

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 60° for 3 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

• USP REFERENCE STANDARDS (11)

USP Ketorolac Tromethamine RS

Ketorolac Tromethamine Injection

DEFINITION

Ketorolac Tromethamine Injection is a sterile solution of Ketorolac Tromethamine. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV spectrum of the ketorolac peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

[NOTE—Protect all solutions from light.]

Mobile phase: Methanol, water, and glacial acetic acid (55:44:1)

Diluent: Methanol and water (1:1)

Standard solution: 0.05 mg/mL of USP Ketorolac Tromethamine RS in *Diluent*

Sample solution: Nominally equivalent to 0.05 mg/mL of ketorolac tromethamine in *Diluent* from Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm. For *Identification test B*, use a diode array detector in the range of 200–600 nm.

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5 for the ketorolac peak

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$) in each mL of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ketorolac from the *Sample solution*

r_S = peak response of ketorolac from the *Standard solution*

C_S = concentration of USP Ketorolac Tromethamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ketorolac tromethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

• ORGANIC IMPURITIES

[NOTE—Protect all solutions from light.]

Mobile phase, Diluent, and Chromatographic system:

Proceed as directed in the *Assay*.

Standard stock solution: 0.10 mg/mL each of USP Ketorolac Tromethamine RS, USP Ketorolac Related Compound A RS, USP Ketorolac Related Compound B RS, USP Ketorolac Related Compound C RS, and USP Ketorolac Related Compound D RS in *Diluent* prepared as follows. Transfer USP Ketorolac Tromethamine RS, USP Ketorolac Related Compound A RS, USP Ketorolac Related Compound B RS, USP Ketorolac Related Compound C RS, and USP Ketorolac Related Compound D RS to a suitable volumetric flask. Add 4% of the volume of the flask with methanol. Sonicate and dilute with *Diluent* to volume.

Standard solution: 0.2 μg/mL each of USP Ketorolac Tromethamine RS, USP Ketorolac Related Compound A RS, USP Ketorolac Related Compound B RS, USP Ketorolac Related Compound C RS, and USP Ketorolac Related Compound D RS in *Diluent* from the *Standard stock solution*

Sample solution: Prepare nominally equivalent to 0.2 mg/mL of ketorolac tromethamine in *Diluent*.

System suitability

Sample: *Standard solution*

[NOTE—See Table 1 for the relative retention times.]

Suitability requirements

Resolution: NLT 2 between ketorolac related compound C and ketorolac

Relative standard deviation: NMT 2.8% for all the peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of ketorolac related compound A, ketorolac related compound B, ketorolac related compound C, and ketorolac related compound D in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of ketorolac related compound A, ketorolac related compound B, ketorolac related compound C, or ketorolac related compound D from the *Sample solution*

r_S = peak response of ketorolac related compound A, ketorolac related compound B, ketorolac related compound C, or ketorolac related compound D from the *Standard solution*

C_S = concentration of the corresponding related compound in the *Standard solution* (mg/mL)

C_U = nominal concentration of ketorolac tromethamine in the *Sample solution* (mg/mL)

Calculate the percentage of any unspecified impurity in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_S = peak response of ketorolac from the *Standard solution*

C_S = concentration of USP Ketorolac Tromethamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ketorolac tromethamine in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1. Disregard any impurity peak less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Ketorolac related compound A	0.4	0.20
Ketorolac related compound B	0.6	0.5
Ketorolac related compound C	0.8	0.5
Ketorolac	1.0	—
Ketorolac related compound D	2.1	0.20
Any unspecified impurity	—	0.20
Total impurities	—	1.50

SPECIFIC TESTS

• **PH (791):** 6.9–7.9

• **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 5.8 USP Endotoxin Units/mg of ketorolac tromethamine.

• **STERILITY TESTS (71):** Meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*

• **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections

• **OTHER REQUIREMENTS:** Meets the requirements in *Injections and Implanted Drug Products (1)*

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass, protected from light, and store at controlled room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Endotoxin RS

USP Ketorolac Tromethamine RS

USP Ketorolac Related Compound A RS

Ketorolac Tromethamine Tablets

DEFINITION

Ketorolac Tromethamine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B.** The UV absorption spectra of the ketorolac peak of the *Sample solution* and that of the *Standard solution* exhibit maxima and minima at the same wavelengths, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Methanol, water, and glacial acetic acid (55:44:1)

Diluent: Methanol and water (1:1). [NOTE—Protect all volumetric solutions from light.]

Standard stock solution: 0.24 mg/mL of USP Ketorolac Tromethamine RS in methanol

Standard solution: 24 µg/mL of USP Ketorolac Tromethamine RS in *Diluent* from *Standard stock solution*

System suitability stock solution: 25 µg/mL each of USP Ketorolac Related Compound A RS, USP Ketorolac Related Compound B RS, USP Ketorolac Related Compound C RS, and USP Ketorolac Related Compound D RS in methanol

System suitability solution: 0.25 µg/mL each of USP Ketorolac Related Compound A RS, USP Ketorolac Related Compound B RS, USP Ketorolac Related Compound C RS, and USP Ketorolac Related Compound D RS in *Standard solution* from *System suitability stock solution*

Sample stock solution: 0.2 mg/mL of ketorolac tromethamine prepared as follows. Transfer 10 Tablets to a suitable volumetric flask. Add a quantity of water equivalent to about 10% of the volume of the flask, and sonicate until the Tablets are disintegrated. Add a quantity of methanol equivalent to 40% of the volume of the flask, and sonicate for 10 min to dissolve the ketorolac tromethamine. Cool to ambient temperature, dilute with methanol to volume, and mix. Centrifuge, or allow to settle.

Sample solution: 0.02 mg/mL of ketorolac tromethamine in *Diluent* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector

Assay: UV 254 nm

Identification test B: Diode array, UV 200–400 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.2 mL/min

Injection volume: 100 µL

Run time: 3.8 times the retention time of the ketorolac peak

System suitability

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times are 0.8 for ketorolac related compound B and 1.0 for the ketorolac peaks.]

Suitability requirements

Resolution: NLT 1.5 each between the ketorolac and ketorolac related compound B, and ketorolac and

ketorolac related compound C peaks, *System suitability solution*

Tailing factor: NMT 1.5, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = response of the ketorolac peak from the *Sample solution*

r_S = response of the ketorolac peak from the *Standard solution*

C_S = concentration of USP Ketorolac Tromethamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ketorolac tromethamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 600 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Ketorolac Tromethamine RS in *Medium*

Sample solutions: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration that is similar to the *Standard solution*.

Instrumental conditions

Mode: UV absorption spectroscopy

Analytical wavelength: 322 nm

Tolerances: NLT 75% (Q) of the labeled amount of ketorolac tromethamine ($C_{15}H_{13}NO_3 \cdot C_4H_{11}NO_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase, Chromatographic system, and Diluent: Proceed as directed in the *Assay*.

Standard solution: Use the *System suitability solution*, prepared as directed in the *Assay*.

Sample solution: Proceed as directed for the *Sample solution* in the *Assay*.

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.5 each between the ketorolac and ketorolac related compound B, and ketorolac and ketorolac related compound C peaks

Relative standard deviation: NMT 5.0% for ketorolac related compound A, ketorolac related compound B, ketorolac related compound C, and ketorolac related compound D

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each known impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each known impurity in the *Sample solution*

r_S = peak response of each known impurity in the *Standard solution*

C_S = concentration of each impurity in the *Standard solution* (mg/mL)

C_u = nominal concentration of ketorolac tromethamine in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Tablets taken:

$$\text{Result} = (r_u/r_t) \times 100$$

r_u = response of each individual impurity peak in the *Sample solution*

r_t = sum of responses for all the peaks in the *Sample solution*

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Ketorolac related compound A	0.5	0.5
Ketorolac related compound B	0.8	0.5
Ketorolac	1.0	—
Ketorolac related compound C	1.2	0.8
Ketorolac related compound D	2.6	0.5
Total unspecified impurity	—	0.5
Total impurities	—	1.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers at controlled room temperature, protected from light and excessive humidity.
- **USP REFERENCE STANDARDS (11)**
 - USP Ketorolac Tromethamine RS
 - USP Ketorolac Related Compound A RS
 - 5-Benzoyl-N-[1,3-dihydroxy-2-(hydroxymethyl)propan-2-yl]-2,3-dihydro-1H-pyrrolizine-1-carboxamide.
 - $C_{19}H_{22}N_2O_5$ 358.39
 - USP Ketorolac Related Compound B RS
 - 5-Benzoyl-2,3-dihydro-1H-pyrrolizin-1-ol.
 - $C_{14}H_{13}NO_2$ 227.26
 - USP Ketorolac Related Compound C RS
 - 5-Benzoyl-2,3-dihydro-1H-pyrrolizin-1-one.
 - $C_{14}H_{11}NO_2$ 225.24

 - 5-Benzoyl-2,3-dihydro-1H-pyrrolizine.
 - $C_{14}H_{13}NO$ 211.26

Krypton Kr 81m

Kr 81m

Krypton, isotope of mass 81 (metastable).

Krypton, isotope of mass 81 (metastable) [15678-91-8].

» Krypton Kr 81m is a gas suitable only for inhalation in diagnostic studies, and is obtained from a generator that contains rubidium 81 adsorbed on an immobilized suitable column support. Rubidium 81 decays with a half-life of 4.58 hours and forms its radioactive daughter ^{81m}Kr , which is eluted from the generator by passage of humidified oxygen or air through the column. Rubidium 81 is produced in an accelerator by proton bombardment of Kr 82. Other radioisotopes of rubidium are produced and are present on the generator column. These other radioisotopes do not decay to ^{81m}Kr . The column contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Rb 81 at the date and time indicated in the labeling, and on elution yields not less than 80.0 percent of ^{81m}Kr .

Packaging and storage—The generator column is enclosed in a lead container. The unit is stored at room temperature.

Labeling—The labeling indicates the name and address of the manufacturer, the name of the generator, the quantity of ^{81}Rb at the date and time of calibration, and the statement, "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of ^{81m}Kr is 13.1 seconds.

NOTE—Perform the following tests and Assay quickly, because of the rapid decay of the ^{81m}Kr .

Radionuclide identification (see *Radioactivity* (821))—The gamma-ray spectrum of eluted ^{81m}Kr exhibits a monoenergetic gamma ray at a mean energy of 191 KeV.

Change to read:

Radionuclidic purity—Using a suitable counting assembly (see *Radioactivity* (821)), determine the radioactivity of each radionuclide present in a specimen of Kr 81m gas obtained from eluting the generator by use of a calibrated system as directed under *Radioactivity* (821). Not less than 99.9% of the radioactivity in the specimen eluted from the generator is present as ^{81m}Kr .

Assay for radioactivity—Using a suitable counting assembly (see *Radioactivity* (821)), determine the quantity, in MBq (mCi), of Kr 81m contained in an elution of the generator. Decay correct the result to the time of generator elution, and calculate the quantity of ^{81}Rb present in the column at the time of elution. The quantity of ^{81m}Kr eluted is not less than 80.0 percent of the labeled MBq (mCi) of ^{81}Rb present on the column at time of elution.

Labetalol Hydrochloride

$C_{19}H_{24}N_2O_3 \cdot HCl$ 364.87

Benzamide, 2-hydroxy-5-[(1-hydroxy-2-[(1-methyl-3-phenylpropyl)amino]ethyl)-, monohydrochloride. 5-[(1-Hydroxy-2-[(1-methyl-3-phenylpropyl)amino]ethyl)salicylamide monohydrochloride [32780-64-6].

» Labetalol Hydrochloride contains not less than 97.5 percent and not more than 101.0 percent of $C_{19}H_{24}N_2O_3 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—
USP Labetalol Hydrochloride RS

Identification—

A: Infrared Absorption (197M).

B: It responds to the tests for Chloride (191).

pH (791): between 4.0 and 5.0, in a solution (1 in 100).

Loss on drying (731): Dry it in a vacuum at 105° for 4 hours; it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals**, Method II (231): 0.002%. (Official 1-Jan-2018)

Chromatographic purity—

Detection reagent—Transfer 2.5 g of cadmium acetate to a 500-mL volumetric flask, add 10 mL of glacial acetic acid, dilute with alcohol to volume, and mix. Just prior to use, prepare a 0.2 in 100 solution of ninhydrin in the cadmium acetate solution for use as the *Detection reagent*.

Solvent mixture—Prepare a solution of methanol and water (4:1), and mix.

Ammonium chloride reference solution—Dissolve 60 mg of ammonium chloride in 10.0 mL of water, and mix.

Standard stock solution—Dissolve USP Labetalol Hydrochloride RS in *Solvent mixture*, and mix to obtain a solution having a known concentration of 40 mg per mL.

Standard solution 1—Quantitatively dilute a portion of the *Standard stock solution* with *Solvent mixture* to obtain a solution having a known concentration of 0.2 mg per mL.

Standard solution 2—Quantitatively dilute a portion of the *Standard solution 1* with *Solvent mixture* to obtain a solution having a known concentration of 0.1 mg per mL.

Test solution—Dissolve 200 mg of Labetalol Hydrochloride in 5.0 mL of *Solvent mixture*, and mix.

Procedure I—Apply separately 5-μL portions of the *Standard stock solution*, *Standard solution 1*, *Standard solution 2*, and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of dichloromethane, methanol, and ammonium hydroxide (15:5:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light: the R_f

value of the principal spot from the *Test solution* corresponds to that of the principal spot from the *Standard stock solution*.

Spray the plate with *Detection reagent*, heat the plate at 105° for 15 minutes, cool to room temperature, and examine the chromatogram: no individual secondary spot observed in the chromatogram of the *Test solution* is greater in size or intensity than the principal spot observed in the chromatogram of *Standard solution 1* (0.5% each). [NOTE—The spots appear as dark orange spots on a light orange to yellow background. A “negative image” spot (white) near the origin may be observed in the chromatogram of the *Test solution*. This is due to the formation of ammonium chloride during the chromatographic procedure and may be ignored.]

Procedure II—Apply separately 10-μL portions of the *Ammonium chloride reference solution*, the *Standard stock solution*, *Standard solution 1*, *Standard solution 2*, and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of ethyl acetate, isopropyl alcohol, water, and ammonium hydroxide (25:15:8:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light: no individual secondary spot (other than that due to ammonium chloride) observed in the chromatogram of the *Test solution* is greater in size or intensity than the principal spot observed in the chromatogram of *Standard solution 1* (0.5% each).

Total impurities—The sum of the intensities of all secondary spots (other than those due to ammonium chloride) observed in the chromatograms of the *Test solution* from both *Procedure I* and *Procedure II* does not exceed 1.0%.

Diastereoisomer ratio—

1-Butaneboronic acid solution—Dissolve 1-butaneboronic acid in pyridine, previously dried over a suitable molecular sieve, and mix to obtain a solution having a known concentration of 20 mg per mL.

System suitability solution—Dissolve an accurately weighed quantity of USP Labetalol Hydrochloride RS in *1-Butaneboronic acid solution*, and dilute quantitatively and stepwise with *1-Butaneboronic acid solution* to obtain a solution having a known concentration of about 1.4 mg of USP Labetalol Hydrochloride RS per mL. Allow the solution to stand at room temperature for 20 minutes before using.

Test solution—Transfer about 1 mg of Labetalol Hydrochloride to a 1-mL reaction vial, add 0.7 mL of *1-Butaneboronic acid solution*, and mix until the labetalol hydrochloride is completely dissolved. Allow the solution to stand at room temperature for 20 minutes before using.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m glass column packed with 10% phase G3 on 100- to 120-mesh support S1AB. The column temperature is maintained at about 320°, and the injection port and the detector block temperatures are maintained at about 340°. Nitrogen is used as the carrier gas at the flow rate of about 30 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 for the diastereoisomer B 1-butaneboronate derivative and 1.0 for the diastereoisomer A 1-butaneboronate derivative; the resolution, R_s , between the diastereoisomer A 1-butaneboronate derivative and diastereoisomer B 1-butaneboronate derivative peaks is not less than 1.5; and the relative standard deviation of the ratios of the peak areas of the diastereoisomers for replicate injections is not more than 2.0%.

Procedure—Inject about 2 μ L of the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the diastereoisomer A content, in percentage, taken by the formula:

$$100r_A / (r_A + r_B)$$

in which r_A is the peak area of the diastereoisomer A 1-butaneboronate derivative peak; and r_B is the peak area of the diastereoisomer B 1-butaneboronate derivative peak. The diastereoisomer A content is not less than 45.0% and not more than 55.0%.

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.1 M monobasic sodium phosphate and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Labetalol Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.4 mg per mL.

Assay preparation—Transfer about 40 mg of Labetalol Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm \times 20-cm column that contains packing L1 and is maintained at $60 \pm 1^\circ$. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 700 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 5 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in the portion of Labetalol Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Labetalol Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Labetalol Hydrochloride Injection

» Labetalol Hydrochloride Injection is a sterile solution of Labetalol Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$).

Packaging and storage—Preserve in single-dose containers, or in multiple-dose containers not exceeding 60 mL in volume, preferably of Type I glass, at a temperature between 2° and 30° . Avoid freezing and exposure to light.

USP Reference standards (11)—

USP Endotoxin RS

USP Labetalol Hydrochloride RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 1.2 USP Endotoxin Units per mg of labetalol hydrochloride.

pH (791): between 3.0 and 4.5.

Other requirements—It meets the requirements under *Injections* and *Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a suitable filtered and degassed mixture of 0.1 M monobasic sodium phosphate and methanol (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Labetalol Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Resolution solution—Dissolve a quantity of methylparaben in the *Standard preparation* to obtain a solution containing about 0.08 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of labetalol hydrochloride, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 20-cm column that contains packing L1 and is maintained at $60 \pm 1^\circ$. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 700 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for methylparaben and 1.0 for labetalol; and the resolution, R , between the methylparaben and labetalol is not less than 2.0.

Procedure—Separately inject equal volumes (about 5 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in each mL of the Injection taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Labetalol Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Labetalol Hydrochloride Compounded Oral Suspension

DEFINITION

Labetalol Hydrochloride Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$).

Prepare Labetalol Hydrochloride Compounded Oral Suspension 40 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Labetalol Hydrochloride	4 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

Place the required number of tablets in a suitable mortar and comminute to a fine powder, or use *Labetalol Hydrochloride* powder. Add 20 mL of the *Vehicle*, and mix to form a uniform paste. Add the *Vehicle* in small portions almost to volume. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add the *Vehicle* in portions to rinse the mortar, then add sufficient *Vehicle* to bring to final volume, and mix well.

ASSAY**• PROCEDURE**

Mobile phase: Methanol and 0.1 M monobasic sodium phosphate (35:65). Filter, and degas.

Standard solution: 400 µg/mL of USP Labetalol Hydrochloride RS

Sample solution: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at -70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the sample into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.3 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for labetalol hydrochloride is about 7.5 min.]

Suitability requirements

Relative standard deviation: NMT 1.6% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Labetalol Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of labetalol hydrochloride in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• PH (791): 4.0–5.0

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Package in tight, light-resistant containers. Store at controlled room temperature, or in a refrigerator.

• BEYOND-USE DATE: NMT 60 days after the date on which it was compounded when stored at controlled room temperature, or in a refrigerator

• LABELING: Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.

• USP REFERENCE STANDARDS (11)

USP Labetalol Hydrochloride RS

Labetalol Hydrochloride Tablets

» Labetalol Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers, at a temperature between 2° and 30°.

USP Reference standards (11)—

USP Labetalol Hydrochloride RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{19}H_{24}N_2O_3 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 302 nm of filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a *Standard solution* having a known concentration of USP Labetalol Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{19}H_{24}N_2O_3 \cdot HCl$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Labetalol Hydrochloride*.

Assay preparation—Transfer an accurately counted number of Tablets, equivalent to about 2000 mg of labetalol hydrochloride, to a 500-mL volumetric flask, add 200 mL of water, and shake by mechanical means for 60 minutes. Dilute with water to volume, and mix. Filter the solution through a filter of 0.5 µm or finer porosity, discarding the first few mL of the filtrate. Transfer 10.0 mL of the filtrate to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of labetalol hydrochloride ($C_{19}H_{24}N_2O_3 \cdot HCl$) in each Tablet taken by the formula:

$$5000(C/N)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Labetalol Hydrochloride RS in the *Standard preparation*; N is the number of Tablets taken; and r_U and r_S are the peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lactase

DEFINITION

Lactase (β -D-galactoside galactohydrolase) is a hydrolytic enzyme derived from the mold *Aspergillus oryzae*. It contains NLT 30,000 USP Lactase Units/g.

[NOTE—One USP Lactase Unit is the lactase activity contained in the amount of enzyme that hydrolyzes one microequivalent of galactosidic linkage per min at a pH of 4.5 and at 37°, as directed in the Assay for Lactase Activity.]

ASSAY

• LACTASE ACTIVITY

Solution A: Dilute 57.5 mL of glacial acetic acid with sufficient water to make a 500-mL solution. Transfer 50 mL of the glacial acetic acid solution into a 1000-mL volumetric flask, add 11.3 mL of 4 N sodium hydroxide, and dilute with water to volume. If necessary, adjust with glacial acetic acid solution or 4 N sodium hydroxide to a pH of 4.50 ± 0.05 .

Substrate solution: On the day of use, weigh 370.0 mg of *o*-nitrophenyl- β -D-galactopyranoside, and place in a 100-mL volumetric flask. Add about 50 mL of *Solution A*, swirl to dissolve, then dilute with *Solution A* to volume.

Standard solution: Transfer about 0.4 g of USP Lactase RS, accurately weighed, to a 1000-mL volumetric flask. Add about 600 mL of water, allow to stand for 15 min, swirl gently, and dilute with water to volume. Pipet 3.0 mL of this solution into a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer an accurately weighed quantity of about 0.4 g of Lactase to a 1000-mL volumetric flask. Add about 600 mL of water, allow to stand for 15 min, swirl gently, and dilute with water to volume. Pipet 3.0 mL of this solution into a 200-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Vis

Analytical wavelength: 420 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Pipet 2.0 mL of *Substrate solution* into three separate test tubes labeled S, U, and B. Transfer the tubes to a thermostated water bath maintained at $37.0 \pm 0.1^\circ$, and incubate for 10 min. Following the incubation, rapidly add 0.5 mL of the *Standard solution* to tube S, 0.5 mL of the *Sample solution* to tube U, and 0.5 mL of water to tube B (the reagent blank). Mix each tube on a vortex mixer for 1 s, and immediately return the tubes to the water bath, which has been maintained at $37.0 \pm 0.1^\circ$. After 15 min of incubation, rapidly add 2.5 mL of a 10% sodium carbonate solution to each test tube to stop the enzyme reaction. Add 20.0 mL of water to each test tube, and mix. Concomitantly determine the absorbances of the three solutions.

Calculate the number of USP Lactase Units in the portion of Lactase taken:

$$\text{Result} = [(A_U - A_B)/(A_S - A_B)] \times P \times (W_S/W_U)$$

A_U = absorbance of the *Sample solution* (tube U)

A_B = absorbance of the reagent blank (tube B)

A_S = absorbance of the *Standard solution* (tube S)

P = potency of USP Lactase RS (USP Units/g)

W_S = weight of USP Lactase RS in the *Standard solution* (g)

W_U = weight of Lactase in the *Sample solution* (g)

Acceptance criteria: NLT 30,000 USP Lactase Units/g

IMPURITIES

- **LOSS ON DRYING** (731)

Analysis: Dry under vacuum at 60° for 4 h.

Acceptance criteria: NMT 6.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers at room temperature.
- **LABELING:** Label it to indicate lactase activity in USP Units.
- **USP REFERENCE STANDARDS** (11)
USP Lactase RS

Lactic Acid

Propanoic acid, 2-hydroxy-;
Lactic acid [50-21-5].

DEFINITION

Lactic Acid is a mixture of lactic acid ($\text{C}_3\text{H}_6\text{O}_3$) and lactic acid lactate ($\text{C}_6\text{H}_{10}\text{O}_5$), equivalent to a total of NLT 88.0% and NMT 92.0%, by weight, of lactic acid ($\text{C}_3\text{H}_6\text{O}_3$). It is obtained by the lactic fermentation of sugars or is prepared synthetically. Lactic Acid obtained by fermentation of sugars is levorotatory, whereas that prepared synthetically is racemic.

[NOTE—Lactic Acid prepared by fermentation becomes dextrorotatory on dilution, which hydrolyzes L-(–)-lactic acid lactate to L-(+)-lactic acid.]

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Lactate** (191): Meets the requirements

ASSAY

• PROCEDURE

Sample: 2.5 mL, accurately weighed

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Back-titrant: 1 N sulfuric acid VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a tared 250-mL flask, add 50.0 mL of *Titrant*, and boil the mixture for 20 min. Add phenolphthalein TS, and titrate the excess alkali in the hot solution with *Back-titrant*. Perform a blank determination. Each mL of *Titrant* is equivalent to 90.08 mg of lactic acid ($\text{C}_3\text{H}_6\text{O}_3$).

Acceptance criteria: 88.0%–92.0% (w/w)

IMPURITIES

• CHLORIDE

Sample solution: 1 in 100

Analysis: To 10 mL of the *Sample solution* acidified with nitric acid add a few drops of silver nitrate TS.

Acceptance criteria: No opalescence is produced immediately.

• **SULFATE**

Sample solution: 1 in 100

Analysis: To 10 mL of the *Sample solution* add 2 drops of hydrochloric acid and 1 mL of barium chloride TS.

Acceptance criteria: No turbidity is produced.

Analysis: To 10 mL of the *Sample solution* add 40 mL of calcium hydroxide TS, and boil for 2 min.

Acceptance criteria: No turbidity is produced.

SPECIFIC TESTS

- **READILY CARBONIZABLE SUBSTANCES**

Sample: 5 mL

Analysis: Rinse a test tube with sulfuric acid, and allow to drain for 10 min. Add 5 mL of sulfuric acid to the test tube, carefully overlay it with the *Sample*, and maintain the tube at 15°.

Acceptance criteria: No dark color develops at the interface of the two acids within 15 min.

- **OPTICAL ROTATION, Angular Rotation (781A):** −0.05° to +0.05° for racemic Lactic Acid

- **SUGARS**

Sample: 5 drops

Analysis: To 10 mL of hot alkaline cupric tartrate TS add the *Sample*.

Acceptance criteria: No red precipitate is formed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
• **LABELING:** Label it to indicate whether it is levorotatory or racemic.

Lactulose Concentrate

$C_{12}H_{22}O_{11}$ 342.30
D-Fructose, 4-O-β-D-galactopyranosyl-;
4-O-β-D-Galactopyranosyl-D-fructofuranose [4618-18-2].

DEFINITION

Lactulose Concentrate is a solution of sugars prepared from Lactose. It consists principally of lactulose together with minor quantities of lactose and galactose, and traces of other related sugars and water. It contains NLT 95.0% and NMT 105.0% of the labeled amount of lactulose ($C_{12}H_{22}O_{11}$). It contains no added substances.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

- **B.** Sample solution: Dilute a portion of Concentrate with water (1 in 20).

Analysis: Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.

Acceptance criteria: A red precipitate of cuprous oxide is formed.

ASSAY

• **PROCEDURE**

Buffer: 1.15 g/L of monobasic sodium phosphate in water

Mobile phase: Acetonitrile and Buffer (82:18). Ensure that the concentration of acetonitrile in the *Mobile phase* is between 78% and 85% to obtain appropriate retention times.

Standard solution: 40 mg/mL of USP Lactulose RS, 4.8 mg/mL of USP Anhydrous Lactose RS, and 3.2 mg/mL of USP Epilactose RS in a mixture of acetonitrile and water (1:1)

Sample solution: Nominally equivalent to 40 mg/mL of lactulose prepared as follows. Transfer a quantity of Concentrate containing 2.0 g of lactulose to a 50-mL volumetric flask, and dissolve in 20 mL of water. Add 25.0 mL of acetonitrile, allow the solution to reach ambient temperature, and dilute with water to volume.

Suitability requirements

Resolution: NLT 1.5 between lactulose and lactose;

NLT 0.9 between lactulose and epilactose

Relative standard deviation: NMT 2.0% for the main peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lactulose ($C_{12}H_{22}O_{11}$) in the portion of *Solution* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Lactulose RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of lactulose in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• UNIFORMITY OF DOSAGE UNITS (905)**

Oral *Solution* packaged in single-unit containers

Acceptance criteria: Meets the requirements

IMPURITIES**• ORGANIC IMPURITIES**

Buffer, Mobile phase, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*. To evaluate the *Suitability requirements*, use the *Standard solution* prepared as directed in the *Assay*.

Standard solution: 6.4 mg/mL of USP Galactose RS, 4.8 mg/mL of USP Anhydrous Lactose RS, 3.2 mg/mL of USP Epilactose RS, 1.2 mg/mL of USP Tagatose RS, and 0.4 mg/mL of USP Fructose RS in a mixture of acetonitrile and water (1:1)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of galactose, lactose, epilactose, tagatose, and fructose, if found, in the portion of *Solution* taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of the relevant related compound from the *Sample solution*
 r_S = peak response of the relevant related compound from the *Standard solution*
 C_S = concentration of the relevant USP Reference Standard in the *Standard solution* (mg/mL)
 C_U = nominal concentration of lactulose in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Tagatose	0.30	4
Fructose	0.34	1
Galactose	0.47	16
Epilactose	0.90	8
Lactulose	1.0	—
Lactose	1.17	12

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total bacterial count is NMT 10^2 cfu/g of lactulose, and the tests for *Salmonella* species and *Escherichia coli* are negative.
- **PH (791):** 2.5–6.5, after 15 min of contact with the electrodes

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, preferably at a temperature between 2° and 30°. Avoid subfreezing temperatures.
- **USP REFERENCE STANDARDS (11)**
 - USP Epilactose RS
 - USP Fructose RS
 - USP Galactose RS
 - USP Anhydrous Lactose RS
 - USP Lactulose RS
 - USP Tagatose RS

Lamivudine

$C_8H_{11}N_3O_3S$	229.26
$C_8H_{11}N_3O_3S \cdot 0.2 CH_3OH$	235.66
$C_8H_{11}N_3O_3S \cdot 0.2 H_2O$	232.86
2(1 <i>H</i>)-Pyrimidinone, 4-amino-1-[2-(hydroxymethyl)-1,3-oxathiolan-5-yl]-, (2 <i>R</i> - <i>cis</i>)-;	
(-)-1-[(2 <i>R</i> ,5 <i>S</i>)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine [134678-17-4].	

DEFINITION

Lamivudine contains NLT 98.0% and NMT 102.0% of lamivudine ($C_8H_{11}N_3O_3S$), calculated on the anhydrous and solvent-free basis. If labeled as a methanol solvate, it contains NLT 98.0% and NMT 102.0% of lamivudine ($C_8H_{11}N_3O_3S$), calculated on the anhydrous, methanol-free, and solvent-free basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *System suitability solution*, as obtained in the test for *Limit of Lamivudine Enantiomer*.

ASSAY**• PROCEDURE**

Buffer: Transfer about 1.9 g of ammonium acetate to a 1000-mL volumetric flask, dissolve in about 900 mL of water, adjust with acetic acid to a pH of 3.8 ± 0.2 , and dilute with water to volume.

Mobile phase: Methanol and Buffer (5:95)

System suitability solution: 0.25 mg/mL of USP Lamivudine Resolution Mixture B RS in *Mobile phase*

Standard solution: 0.25 mg/mL of USP Lamivudine RS in *Mobile phase*

Sample solution: 0.25 mg/mL of Lamivudine in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 277 nm

Column: 4.6-mm \times 25-cm; packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lamivudine diastereomer and lamivudine are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between lamivudine and lamivudine diastereomer, *System suitability solution*

Relative standard deviation: NMT 2.0% for lamivudine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lamivudine ($C_8H_{11}N_3O_3S$) in the portion of Lamivudine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamivudine RS in the *Standard solution* (mg/mL)

C_U = concentration of Lamivudine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

If labeled as a methanol solvate: 98.0%–102.0% on the anhydrous, methanol-free, and solvent-free basis

OTHER COMPONENTS

- **CONTENT OF METHANOL** (if labeled as lamivudine methanol solvate)

Diluent: *N,N*-Dimethylformamide and *t*-butanol (500:1)

Standard solution: 0.625 mg/mL of methanol in diluent. Transfer 2.0 mL of this solution into a headspace vial, and immediately seal the vial.

Sample solution: Transfer 50 mg of Lamivudine to a headspace vial, add 2.0 mL of *Diluent*, and immediately seal the vial.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC headspace

Detector: Flame ionization

Column: 0.53-mm \times 75-m, coated with a 3- μ m film of phase G43

Temperatures

Injector: 180°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	13
40	40	240	12

Injection volume: 1.0 mL

Injection type: Split ratio, 15:1

Carrier gas: Helium

Flow rate: 6 mL/min

Headspace samplers

Oven: 95°

Loop: 175°

Transfer line: 175°

Equilibrium time: 10 min

System suitability

Sample: Standard solution

[NOTE—The relative retention times for methanol and *t*-butanol are 1.0 and 1.9, respectively.]

Suitability requirements

Tailing factor: NMT 2.0 for methanol

Column efficiency: NLT 25,000 for methanol

Relative standard deviation: NMT 5.0% for methanol

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of methanol in the portion of lamivudine methanol solvate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of methanol to *t*-butanol from the Sample solution

R_S = peak response ratio of methanol to *t*-butanol from the Standard solution

C_S = concentration of methanol in the Standard solution (mg/mL)

C_U = concentration of Lamivudine (as methanol solvate) in the Sample solution (mg/mL)

Acceptance criteria: 2.0%–3.0%

IMPURITIES

• LIMIT OF LAMIVUDINE ENANTIOMER

Buffer: 7.7 g/L of ammonium acetate in water

Mobile phase: Methanol and Buffer (5:95)

System suitability solution: 0.25 mg/mL of USP

Lamivudine Resolution Mixture A RS in water

Sample solution: 0.25 mg/mL of Lamivudine in water

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; packing L45

Column temperature: 15°–30° (constant temperature)

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Sample: System suitability solution

[NOTE—The relative retention times for lamivudine and the lamivudine enantiomer are 1.0 and 1.2, respectively.]

Suitability requirements

Resolution: NLT 1.5 between lamivudine and the lamivudine enantiomer

Analysis

Sample: Sample solution

Calculate the percentage of the lamivudine enantiomer in the portion of Lamivudine taken:

$$\text{Result} = [r_U/(r_U + r_S)] \times 100$$

r_U = peak response of the lamivudine enantiomer

r_S = peak response of lamivudine

Acceptance criteria: NMT 0.3%

• OTHER RELATED COMPOUNDS

Buffer, Mobile phase, System suitability solution, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Salicylic acid standard solution: 0.625 µg/mL of USP

Salicylic Acid RS in Mobile phase

Sample solution: 0.25 mg/mL of Lamivudine in Mobile phase

Analysis

Samples: Salicylic acid standard solution and Sample solution

Calculate the percentage of salicylic acid in the portion of Lamivudine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of salicylic acid from the Sample solution

r_S = peak response of USP Salicylic Acid RS from the Salicylic acid standard solution

C_S = concentration of salicylic acid in the Salicylic acid standard solution (mg/mL)

C_U = concentration of Lamivudine in the Sample solution (mg/mL)

Calculate the percentage of other individual impurities in the portion of Lamivudine taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity other than salicylic acid from the Sample solution

r_T = sum of the responses of all the peaks

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lamivudine-carboxylic acid ^a	0.4	0.3
Lamivudine-trans (lamivudine diastereomer) ^b	0.9	0.2
Lamivudine	1.0	—
Salicylic acid	2.7	0.1
Any other individual impurity	—	0.1
Total impurities	—	0.6

^a (2*RS*,5*SR*)-5-(Cytosine-1-yl)-1,3-oxathiolane-2-carboxylic acid.

^b 1-[(2*RS*,5*SR*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine.

• RESIDUAL SOLVENTS

Internal standard solution: Dilute 1 mL of 2-pentanol with dimethyl sulfoxide and water (1:1) to 100.0 mL.

Standard solution: Transfer 10 mL of the Internal standard solution to a 100-mL volumetric flask. Add 100 µL each of the following: dehydrated alcohol, isopropyl acetate, methanol, and triethylamine. Dilute with dimethyl sulfoxide and water (1:1) to volume.

Sample solution: Transfer 5 g of Lamivudine to a 100-mL volumetric flask, add 10 mL of the Internal standard solution, and dilute with dimethyl sulfoxide and water (1:1) to volume.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 50-m, coated with a 5-µm film of phase G1

Temperatures

Injector: 150°

Detector: 250°

Column: See Table 3.

Table 3

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
70	—	70	3
70	30	200	6.5

Injection volume: 0.5 µL

Injection type: Split flow rate, 320 mL/min

Carrier gas: Hydrogen (at pressure 5 psig)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each residual solvent in the portion of Lamivudine taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of the respective analyte to the internal standard from the *Sample solution*

R_S = peak response ratio of the respective analyte to the internal standard from the *Standard solution*

C_S = concentration of the respective analyte in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: See Table 4.

Table 4

Name	Acceptance Criteria, NMT (%)
Alcohol	0.2
Isopropyl acetate	0.2
Methanol	0.1
Triethylamine	0.1
Total residual solvents	0.3

SPECIFIC TESTS

- **WATER DETERMINATION**, Method 1c (921): NMT 2.0%

- **LIGHT ABSORPTION**

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: Vis

Sample solution: 50 mg/mL in water

Analytical wavelength: 440 nm

Cell: 4 cm

Acceptance criteria: Absorptivity NMT 0.0015

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at room temperature.
- **LABELING:** Where it is a methanol solvate form, the label so indicates.
- **USP REFERENCE STANDARDS (11)**
 - USP Lamivudine RS
 - USP Lamivudine Resolution Mixture A RS
 - USP Lamivudine Resolution Mixture B RS
 - USP Salicylic Acid RS

Lamivudine Oral Solution

DEFINITION

Lamivudine Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$). It may contain a suitable preservative.

IDENTIFICATION

- **A.** The retention time of the lamivudine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Solution A: 2.0 g/L of sodium heptanesulfonate in water. Add 1.0 mL of hydrochloric acid and 1.0 mL of triethylamine per L of the solution.

Solution B: Acetonitrile and *Solution A* (50:50)

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	60	40
30	10	90
33	10	90
34	100	0
45	100	0

Diluent: Acetonitrile and water (10:90)

System suitability solution: Dissolve the contents of 1 vial of USP Lamivudine Resolution Mixture C RS in 2.5 mL of *Diluent*.

Standard solution: 0.2 mg/mL of USP Lamivudine RS in *Diluent*

Sample solution: Nominally 0.2 mg/mL of lamivudine in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 277 nm

Column: 4.6-mm × 10-cm; 3-µm packing L1

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between lamivudine-S-sulfoxide and lamivudine-R-sulfoxide, *System suitability solution*

Tailing factor: NMT 2.0 for the lamivudine peak, *System suitability solution*

Relative standard deviation: NMT 2% for the lamivudine peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lamivudine from the *Sample solution*

r_S = peak response of lamivudine from the *Standard solution*

C_S = concentration of USP Lamivudine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamivudine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME** (698): Meets the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A, Solution B, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: *Sample solution*

Calculate the percentage of any individual impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times 100$$

r_U = peak response of each individual impurity

r_S = sum of the responses of all of the peaks excluding peaks due to added preservative(s) or excipients

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lamivudine-uracil derivative ^a	0.34	1.2
Cytosine ^b	0.52	0.3
Lamivudine-S-sulfoxide ^c	0.61	0.3
Lamivudine-R-sulfoxide ^d	0.63	0.6
Lamivudine carboxylic acid ^{e,f}	0.89	—
Lamivudine <i>trans</i> - ^g	0.94	—
Lamivudine	1.0	—
Salicylic acid ^f	1.38	—
Any other identified impurity	—	0.3
Any individual unidentified impurity	—	0.2
Total impurities	—	2.0

^a 1-[(2R,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]uracil.

^b 4-Aminopyrimidin-2(1H)-one.

^c 1-[(2R,3S,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide.

^d 1-[(2R,3R,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine S-oxide.

^e (2R,5S)-5-(Cytosine-1-yl)-1,3-oxathiolane-2-carboxylic acid.

^f This impurity is controlled in the drug substance and is not to be included in the total impurities. Disregard any peak less than 0.01%.

^g 1-[(2S,5S)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine.

SPECIFIC TESTS

- **pH** (791): 5.7–6.3

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^2 cfu/mL. The total molds and yeasts count does not exceed 10^2 cfu/mL. It meets the requirements of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in light-resistant containers at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
 - USP Lamivudine RS
 - USP Lamivudine Resolution Mixture C RS

[NOTE—This reference standard contains lamivudine and several related impurities.]

Lamivudine Tablets

DEFINITION

Lamivudine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197M)

Sample: Crush 1 Tablet and transfer it to a suitable container. Add 5 mL of methanol and shake for 15 min. Pass through a suitable filter, collecting about 2 mL of the filtrate. Evaporate the filtrate to dryness under a gentle stream of nitrogen, and use the residue.

Standard: Dissolve a suitable amount of USP Lamivudine RS in a small amount of methanol, shaking until completely dissolved. Evaporate to dryness under a gentle stream of nitrogen, and use the residue.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 1.9 g/L of ammonium acetate in water. Adjust with acetic acid to a pH of 3.8.

Mobile phase: Methanol and Buffer (50:950)

System suitability solution: 0.2 mg/mL of USP

Lamivudine Resolution Mixture B RS in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Lamivudine RS in *Mobile phase*

Sample stock solution: Nominally about 3–4 mg/mL of lamivudine in water prepared as follows. Transfer the required number of Tablets, based on the labeled amount, to a suitable volumetric flask, and soak or shake for at least 15 min in water to disperse the sample. Dilute with water to volume, mix, and pass through a suitable filter or centrifuge.

Sample solution: Nominally 0.2 mg/mL of lamivudine in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 277 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: $30 \pm 5^\circ$

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lamivudine diastereomer and lamivudine are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between lamivudine and lamivudine diastereomer, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamivudine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamivudine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Procedure for products labeled as Lamivudine Tablets 100-mg or 150-mg

Medium: Water, degassed; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: (L/900) mg/mL of USP

Lamivudine RS in Medium, where L is the Tablet label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter to obtain a concentration similar to that of the Standard solution.

Instrumental conditions

Mode: UV

Analytical wavelength: 270 nm

Cell: 1 mm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of USP Lamivudine RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) is dissolved.

Procedure for products labeled as Lamivudine Tablets 300-mg

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 15 min

Standard solution: (L/900) mg/mL of USP

Lamivudine RS in Medium, where L is the Tablet label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

Mode: UV

Analytical wavelength: 280 nm

Cell: 0.5 mm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of USP Lamivudine RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 15 min

Buffer: 1.93 g/L of ammonium acetate in water. Adjust with glacial acetic acid to a pH of 3.8.

Mobile phase: Methanol and Buffer (40:60)

Standard solution: (L/900) mg/mL of USP Lamivudine RS in Medium, where L is the Tablet label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter to obtain a concentration similar to that of the Standard solution.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: 285 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 5 μL

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 2.0%

Tailing factor: NMT 1.5

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Lamivudine RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: Sample solution

Calculate the percentage of each individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual impurity

r_T = sum of all the peak responses

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Cytosine ^a	0.32	0.2
Lamivudine-carboxylic acid ^b	0.39	— ^c
Lamivudine-S-sulfoxide ^d	0.43	0.2

Process impurities are controlled in the drug substance and are not to be reported or included in the total impurities for the drug product.^d 1-[(2*R*,3*S*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine 5-oxide.^e 1-[(2*R*,3*R*,5*S*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine 5-oxide.^f 1-[(2*RS*,5*RS*)-2-(Hydroxymethyl)-1,3-oxathiolan-5-yl]cytosine.**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
USP Lamivudine RS
USP Lamivudine Resolution Mixture B RS
[NOTE—The resolution mixture contains lamivudine and lamivudine diastereomer. Other impurities may also be present.]

Lamivudine and Zidovudine Tablets**DEFINITION**

Lamivudine and Zidovudine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) and zidovudine ($C_{10}H_{13}N_5O_4$).

IDENTIFICATION

- **A.** The retention times of the lamivudine and zidovudine peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 25 mM of ammonium acetate. Adjust with glacial acetic acid to a pH of 4.0.

Solution B: Methanol

Solution C: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)	Solution C (%)
0	95	5	0
15.0	95	5	0
30.0	70	30	0
38.0	70	30	0
38.1	0	0	100
45.0	0	0	100
45.1	95	5	0
60.0	95	5	0

Diluent: *Solution A* and *Solution B* (19:1)

System suitability solution: 0.17 mg/mL of USP Lamivudine Resolution Mixture B RS in *Diluent*

Standard solution: 0.15 mg/mL of USP Lamivudine RS and 0.30 mg/mL of USP Zidovudine RS in *Diluent*

Sample stock solution: Transfer a counted number of Tablets, equivalent to 1500 mg of zidovudine and 750 mg of lamivudine, into a 500-mL volumetric flask. Add 250 mL of water, and disintegrate completely by shaking for a minimum of 15 min. Dilute with water to volume, and mix.

Sample solution: Pass a portion of the *Sample stock solution* through a filter of 0.45- μ m pore size, discarding the first 2–3 mL. Further dilute the filtrate to obtain 0.15 mg/mL of lamivudine and 0.30 mg/mL of zidovudine in *Diluent*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 3-mm \times 25-cm; packing L1

Flow rate: 0.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lamivudine diastereomer and lamivudine are 0.50 and 0.52, respectively.]

Suitability requirements

Resolution: NLT 1.5 between lamivudine diastereomer and lamivudine, *System suitability solution*

Relative standard deviation: NMT 2.0% for zidovudine and lamivudine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of lamivudine ($C_8H_{11}N_3O_3S$) and zidovudine ($C_{10}H_{13}N_5O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of zidovudine or lamivudine from the *Sample solution*

r_S = peak response of zidovudine or lamivudine from the *Standard solution*

C_S = concentration of USP Zidovudine RS or USP Lamivudine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of zidovudine or lamivudine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1**

Medium: 0.1 N hydrochloric acid; 900 mL, deaerated

Apparatus 2: 75 rpm

Time: 15 min

Lamivudine response factor solutions: 0.167 mg/mL of USP Lamivudine RS in *Medium*. [NOTE—Prepare in duplicate.]

Zidovudine response factor solutions: 0.333 mg/mL of USP Zidovudine RS in *Medium*. [NOTE—Prepare in duplicate.]

Sample solution: Pass a portion of the solution under test through a suitable filter (PTFE, PVDF, or equivalent) of 0.45- μ m pore size.

Detector: UV 240–300 nm

Blank: *Medium*

Cell length: 0.02-cm flowcell

Analysis: The calculations of the percentages dissolved are done using a multicomponent analysis software.

Tolerances: NLT 85% (Q) of the labeled amount of zidovudine and lamivudine is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Buffer solution: 7.7 g/L of ammonium acetate in water

Mobile phase: Acetonitrile and Buffer solution (1:9)

Standard stock solution: 1.4 mg/mL of USP

Lamivudine RS and 2.8 mg/mL of USP Zidovudine RS in Medium. A small amount of methanol, NMT 20% of the final volume, can be used to dissolve both compounds.

Standard solution: 0.168 mg/mL of lamivudine and 0.336 mg/mL of zidovudine in Medium from the Standard stock solution

Sample solution: Pass a portion of the solution under test through a suitable filter.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 15-cm; packing L1

Column temperature: 40°

Flow rate: 1.2 mL/min

Injection volume: 10 µL

System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 1500 theoretical plates for lamivudine and NLT 3000 theoretical plates for zidovudine

Tailing factor: NMT 2.0 for lamivudine and zidovudine

Relative standard deviation: NMT 2.0% for zidovudine and lamivudine

Calculate the percentages of lamivudine ($C_8H_{11}N_3O_3S$) and zidovudine ($C_{10}H_{13}N_5O_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of lamivudine or zidovudine from the Sample solution

r_S = peak response of lamivudine or zidovudine from the Standard solution

C_S = concentration of lamivudine or zidovudine in the Standard solution (mg/mL)

L = label claim for lamivudine or zidovudine (mg/Tablet)

V = volume of Medium, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of zidovudine and lamivudine is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for zidovudine and lamivudine

IMPURITIES

• ORGANIC IMPURITIES

Solution A, Solution B, Solution C, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: Sample solution

Calculate the percentage of each lamivudine related impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each individual impurity from the Sample solution

r_T = sum of the peak responses of lamivudine and all lamivudine related impurities from the Sample solution

Calculate the percentage of each zidovudine related impurity and unspecified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the Sample solution

r_T = sum of the peak responses of zidovudine, all zidovudine related impurities, and unspecified impurities from the Sample solution

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lamivudine-(cytosine) ^a	0.11	1.0	— ^b
Lamivudine-(uracil) ^c	0.14	1.0	— ^b

^k 2-Hydroxybenzoic acid.

^l 3'-Chloro-3'-deoxythymidine.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light, and store between 2° and 30°.

- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
 - USP Lamivudine RS
 - USP Lamivudine Resolution Mixture B RS
 - USP Zidovudine RS

Lamotrigine

$C_9H_7Cl_2N_5$ 256.09
1,2,4-Triazine-3,5-diamine, 6-(2,3-dichlorophenyl);
3,5-Diamino-6-(2,3-dichlorophenyl)-*as*-triazine [84057-84-1].

DEFINITION

Lamotrigine contains NLT 98.0% and NMT 102.0% of $C_9H_7Cl_2N_5$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Diluent: Dilute 8.5 mL of hydrochloric acid with water to 1 L (0.1 M hydrochloric acid).
Buffer: 2.7 g/L of monobasic potassium phosphate in water
Solution A: Triethylamine and *Buffer* (1:150). Adjust with phosphoric acid to a pH of 2.0.
Solution B: Acetonitrile
Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	76.5	23.5
4	76.5	23.5
14	20	80
15	76.5	23.5
19	76.5	23.5

Standard solution: 0.2 mg/mL of USP Lamotrigine RS prepared as follows. Transfer the required amount of USP Lamotrigine RS to a suitable volumetric flask, and add 5% of the final volume with methanol to facilitate dissolution. Dilute with *Diluent* to volume.

Sample solution: 0.2 mg/mL of Lamotrigine prepared as follows. Transfer the required amount of lamotrigine to a suitable volumetric flask, and add 5% of the final volume with methanol to facilitate dissolution. Dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lamotrigine ($C_9H_7Cl_2N_5$) in the portion of Lamotrigine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamotrigine RS in the *Standard solution* (mg/mL)

C_U = concentration of Lamotrigine in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **HEAVY METALS, Method II (231):** 10 ppm (Official 1-Jan-2018)

LIMIT OF LAMOTRIGINE RELATED COMPOUND B

Diluent, Solution A, and Sample solution: Prepare as directed in the *Assay*.

Mobile phase: Acetonitrile and *Solution A* (35:65)

System suitability stock solution: 0.2 mg/mL of USP Lamotrigine RS prepared as follows. Transfer the required amount of USP Lamotrigine RS to a suitable volumetric flask, and add 5% of the final volume with methanol to facilitate dissolution. Dilute with *Diluent* to volume.

Standard stock solution: 0.01 mg/mL of USP Lamotrigine Related Compound B RS prepared as follows. Transfer the required amount of USP Lamotrigine Related Compound B RS to a volumetric flask. Add 80% of the flask volume of methanol, and acidify with 1% of the flask volume of hydrochloric acid. Allow to cool, and dilute with methanol to volume. Dilute a portion of this solution with *Diluent*.

System suitability solution: 1 μg/mL of lamotrigine related compound B from the *Standard stock solution* in *System suitability stock solution*

Standard solution: 5 μg/mL of lamotrigine related compound B from the *Standard stock solution* in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection size: 10 μL

Run time: 2 times the retention time of lamotrigine related compound B

System suitability

Sample: *System suitability solution*

[NOTE—Identify the peaks in the *System suitability solution*, taking into account that lamotrigine is unretained, eluting at or near the solvent front.]

Suitability requirements

Tailing factor: NMT 2.0 for the lamotrigine related compound B peak

Relative standard deviation: NMT 5.0% for the lamotrigine related compound B peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of lamotrigine related compound B in the portion of Lamotrigine taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response for lamotrigine related compound B from the *Sample solution*
 r_s = peak response for the lamotrigine related compound B from the *Standard solution*
 C_s = concentration of USP Lamotrigine Related Compound B RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_u = concentration of Lamotrigine in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: NMT 0.1% of lamotrigine related compound B. [NOTE—Lamotrigine related compound D, if present, will elute at a retention time of about 1.5 relative to lamotrigine related compound B. Disregard this peak as it is quantified in the test for *Organic Impurities*.]

• ORGANIC IMPURITIES

Diluent, Buffer, Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

System suitability stock solution: 0.2 mg/mL of USP Lamotrigine RS prepared as follows. Transfer the required amount of USP Lamotrigine RS to a suitable volumetric flask, and add 5% of the final volume with methanol to facilitate dissolution. Dilute with *Diluent* to volume.

Impurities stock solution: 0.1 mg/mL of each of USP Lamotrigine Related Compound C RS and USP Lamotrigine Related Compound D RS prepared as follows. Transfer suitable quantities of the Reference Standards to a suitable volumetric flask. Add an amount of methanol equal to 80% of the flask volume, and acidify with 1% of the flask volume of hydrochloric acid. Allow to cool. Dilute with methanol to volume.

System suitability solution: 0.5 $\mu\text{g/mL}$ each of lamotrigine related compound C and lamotrigine related compound D from *Impurities stock solution* in *System suitability stock solution*.

System suitability

Sample: *System suitability solution*

[NOTE—Refer to *Table 2* for relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between lamotrigine and lamotrigine related compound C peaks

Analysis

Samples: *Diluent* and *Sample solution*

[NOTE—Disregard any peak that may be present in the chromatogram of the *Diluent* injection. Disregard any peak due to lamotrigine related compound B, because it is quantified in the test for *Limit of Lamotrigine Related Compound B*.]

Calculate the percentage of each impurity in the portion of Lamotrigine taken:

$$\text{Result} = (r_u/r_s) \times (1/F) \times 100$$

- r_u = peak response for each impurity from the *Sample solution*
 r_s = peak response for the lamotrigine peak from the *Sample solution*
 F = relative response factor for each impurity from *Table 2*

Acceptance criteria: See *Table 2*.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lamotrigine	1.0	1.0	—
Lamotrigine related compound C ^a	1.5	1.0	0.1
Lamotrigine related compound B ^{b,c}	3.2	—	—
Lamotrigine related compound D ^d	3.7	0.8	0.2
Any individual, unspecified impurity	—	1.0	0.1
Total impurities, excluding lamotrigine related compound B	—	—	0.2

^a 3-Amino-6-(2,3-dichlorophenyl)-1,2,4-triazin-5(4H)-one.

^b 2,3-Dichlorobenzoic acid.

^c Included only for identification.

^d N-[5-Amino-6-(2,3-dichlorophenyl)-1,2,4-triazin-3-yl]-2,3-dichlorobenzamide.

SPECIFIC TESTS

- **Loss on Drying** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.
- **USP REFERENCE STANDARDS** (11)
 - USP Lamotrigine RS
 - USP Lamotrigine Related Compound B RS
 - 2,3-Dichlorobenzoic acid.

Lamotrigine Tablets

DEFINITION

Lamotrigine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lamotrigine ($\text{C}_9\text{H}_7\text{Cl}_2\text{N}_3$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION** (197U)

Standard solution: 0.02 mg/mL of USP Lamotrigine RS in 0.01 N hydrochloric acid

Sample solution: 0.02 mg/mL of lamotrigine from crushed powdered Tablets in 0.01 N hydrochloric acid

Acceptance criteria: The spectra of the *Standard solution* and *Sample solution* exhibit maxima and minima at the same wavelengths.

- **B.** The retention time of the lamotrigine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer: 0.8 g/L of ammonium acetate. Adjust with glacial acetic acid to a pH of 4.5.

Mobile phase: Methanol and *Buffer* (60:40)

Standard solution: 0.05 mg/mL of USP Lamotrigine RS in *Mobile phase*

Sample solution: Transfer an amount equivalent to 100 mg of lamotrigine from a portion of crushed Tablets (NLT 20) to a suitable volumetric flask to obtain a nominal concentration of lamotrigine of 1.0 mg/mL. Dissolve in 70% of the flask volume of *Mobile phase* by sonicating for 20 min. Dilute with *Mobile phase* to volume. Centrifuge the solution. Quantitatively dilute a suitable volume of centrifugate with *Mobile phase* to obtain a nominal concentration of 0.05 mg/mL of lamotrigine.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for lamotrigine

Relative standard deviation: NMT 2.0% for lamotrigine

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of lamotrigine (C₉H₇Cl₂N₅) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamotrigine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamotrigine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• DISSOLUTION (711)****Test 1**

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Determine the amount of lamotrigine (C₉H₇Cl₂N₅) dissolved by using one of the following methods.

Spectrometric method

Standard stock solution: 0.15 mg/mL of USP Lamotrigine RS in *Medium* prepared as follows. Dissolve a suitable quantity in 5% of the flask volume of methanol, then dilute with *Medium* to volume.

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a final concentration of 0.028 mg/mL.

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Dilute with *Medium* according to *Table 1*.

Table 1

Tablet Label Claim (mg)	Volume of Sample (mL)	Volume of Volumetric Flask	Final Concentration (mg/mL)
25	—	—	0.028
100	5.0	20	0.029
150	4.0	25	0.027
200	3.0	25	0.027

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 267 nm

Blank: *Medium*

Analysis

Calculate the percentage of the labeled amount of lamotrigine (C₉H₇Cl₂N₅) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

D = dilution factor of the *Sample solution*

V = volume of *Medium*, 900 mL

Chromatographic method

Buffer and Mobile phase: Prepare as directed in the *Assay*.

Standard stock solution: 0.5 mg/mL of USP Lamotrigine RS in *Medium*, prepared as follows. Dissolve a suitable quantity in 15% of the flask volume of methanol, then dilute with *Medium* to volume.

Standard solution: (L/1000) mg/mL of USP Lamotrigine RS from the *Standard stock solution* in *Medium*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Column: 4.6-mm × 15-cm; 5-μm packing L1

Detector: UV 310 nm

Flow rate: 1 mL/min

Injection size: See *Table 2*.

Table 2

Label Claim (mg/Tablet)	Injection Size (μL)
25	50
100, 150, 200	10

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for lamotrigine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamotrigine (C₉H₇Cl₂N₅) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of lamotrigine is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, Apparatus, and Time: Proceed as directed for *Test 1*.

Analysis: Determine the amount of lamotrigine dissolved using either the *Spectrometric method* or *Chromatographic method* described in *Test 1*.

Tolerances: NLT 75% (Q) of the labeled amount of lamotrigine is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 15 min

Standard solution: (L/900) mg/mL of USP Lamotrigine RS in *Medium*, where L is the Tablet label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 270 nm

Cell

For Tablets labeled to contain 100, 150, or

200 mg: 0.2-cm flow cell

For Tablets labeled to contain 25 mg: 1 cm

Blank: *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamotrigine ($C_9H_7Cl_2N_5$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of lamotrigine is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer: Prepare as directed in the *Assay*.

Mobile phase: Acetonitrile, methanol, and *Buffer* (10:30:60)

Diluent: Methanol and *Buffer* (60:40)

System suitability solution: 1 μ g/mL of Lamotrigine Related Compound B RS and 0.4 mg/mL of USP Lamotrigine RS in *Diluent*

Standard solution: 1.0 μ g/mL of USP Lamotrigine RS in *Diluent*

Sample solution: Transfer an amount equivalent to 100 mg of lamotrigine from a portion of crushed Tablets (NLT 20) to a suitable volumetric flask to obtain a nominal concentration of lamotrigine of about 0.4 mg/mL. Dissolve in 70% of the flask volume of *Mobile phase* by sonicating and shaking intermittently for 30 min. Dilute with *Diluent* to volume. Pass through a membrane filter of 0.45- μ m pore size.

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection size: 5 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between lamotrigine related compound B and lamotrigine, *System suitability solution*

Tailing factor: NMT 2.0 for lamotrigine, *Standard solution*

Relative standard deviation: NMT 10.0% for lamotrigine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of lamotrigine from the *Standard solution*

C_S = concentration of USP Lamotrigine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamotrigine in the *Sample solution* (mg/mL)

F = relative response factor for the corresponding impurity (see *Table 3*)

Acceptance criteria: See *Table 3*.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lamotrigine related compound B ^a	0.67	0.75	0.2
Lamotrigine	1.0	—	—
Lamotrigine related compound C ^b	1.5	1.0	0.5
Any individual unspecified degradation impurity	—	1.0	0.2

 - USP Lamotrigine Related Compound B RS
 - 2,3-Dichlorobenzoic acid.
 - $C_7H_4Cl_2O_2$ 191.01

Lamotrigine Extended-Release Tablets

DEFINITION

Lamotrigine Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lamotrigine ($C_9H_7Cl_2N_5$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, water, and trifluoroacetic acid (25: 75: 0.05)

Diluent: Acetonitrile, methanol, and water (10:20:70)

Standard solution: 0.25 mg/mL of USP Lamotrigine RS in *Diluent*. Sonication may be used to aid dissolution.

Sample stock solution: 1.0–3.0 mg/mL of lamotrigine prepared as follows. Transfer NLT 5 Tablets to a suitable volumetric flask containing 10% of the flask volume of

acetonitrile. Allow the Tablets to disperse. Add 20% of the flask volume of methanol. Sonicate for 10 min. Add 30% of the flask volume of 0.1 M hydrochloric acid. Sonicate for 25 min or until a fine, even dispersion is obtained. Allow to cool to room temperature. Dilute with 0.1 M hydrochloric acid to volume. Pass a portion of the solution through a nylon filter of 0.45- μ m pore size and use the filtrate.

Sample solution: Nominally 0.2–0.3 mg/mL of lamotrigine in 0.1 M hydrochloric acid from a suitable volume of *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm \times 15-cm; 3- μ m packing L1

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 5 μ L

Run time: NLT 8 times the retention time of lamotrigine

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 1.5%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamotrigine ($C_9H_7Cl_2N_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamotrigine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamotrigine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium 1: 0.01 M hydrochloric acid; 700 mL

Medium 2: 7.8 g of tribasic sodium phosphate, and 22.5 g of sodium dodecyl sulfate in 1 L of water. This solution has a pH of about 12.

Apparatus 2: 50 rpm with sinkers (see *Figure 2a* in (711))

Times

For Tablets labeled to contain 25 or 50 mg: 2, 7, 15 h

For Tablets labeled to contain 100, 200, or 250 mg: 2, 5, 12 h

For Tablets labeled to contain 300 mg: 2, 6, 13 h

Procedure: Run the test with *Medium 1* for 2 h. Add 200 mL of *Medium 2*, preheated at 37°. Within 5 min of the addition of *Medium 2*, withdraw the sample for the 2 h time point. Continue the testing by drawing samples at the time points specified in *Table 1*, *Table 2*, or *Table 3*, depending on the label claim.

Diluent: *Medium 1* and *Medium 2* (70:20)

Standard solution: (L/900) mg/mL of USP Lamotrigine RS in *Diluent*, where L is the label claim in mg/Tablet

Sample solution: Pass a suitable portion of the solution under test through a suitable filter of 0.45- μ m pore size. Dilute with *Diluent* if necessary.

Blank: *Diluent*

Instrumental conditions

Mode: UV

Analytical wavelength: 260 nm. [NOTE—Depending on the label claim, cells with suitable path lengths may be used.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount (Q) of lamotrigine ($C_9H_7Cl_2N_3$) dissolved at each time point *i*.

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

D = dilution factor if needed

L = label claim (mg/Tablet)

Tolerances

For Tablets with 25- or 50-mg label claim: See *Table 1*.

For Tablets with 100-, 200-, or 250-mg label claim: See *Table 2*.

For Tablets with 300-mg label claim: See *Table 3*.

Table 1

Time Point (i)	Time (h)	Amount Dissolved
1	2	NMT 10%
2	7	35%–55%
3	15	NLT 80%

Table 2

Time Point (i)	Time (h)	Amount Dissolved	
		100 mg, 200 mg	250 mg
1	2	NMT 10%	NMT 10%
2	5	20%–45%	20%–40%
3	12	NLT 80%	NLT 80%

Table 3

Time Point (i)	Time (h)	Amount Dissolved
1	2	NMT 10%
2	6	25%–45%
3	13	NLT 80%

The percentages of the labeled amount of lamotrigine ($C_9H_7Cl_2N_3$) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Diluent 1: Acetonitrile, methanol, and 0.1 M hydrochloric acid (10:20:70)

Diluent 2: Acetonitrile, methanol, and water (10:20:70)

System suitability stock solution: 0.025 mg/mL of USP Lamotrigine Related Compound C RS in *Diluent 1*

System suitability solution: 1.25 μ g/mL of USP Lamotrigine Related Compound C RS and 0.25 mg/mL of USP Lamotrigine RS in *Diluent 2* prepared as follows. Transfer a suitable amount of USP Lamotrigine RS to a suitable volumetric flask. Transfer a suitable volume of *System suitability stock solution* to the flask. Dissolve and dilute with *Diluent 2* to volume.

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 10 between the lamotrigine and lamotrigine related compound C peaks

Signal-to-noise ratio: NLT 100 for lamotrigine related compound C

Analysis

Sample: *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each impurity from the *Sample solution*

r_T = sum of all of the impurity peak responses and the lamotrigine peak response from the *Sample solution*

Acceptance criteria: See Table 4. Disregard peaks less than 0.05%.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lamotrigine	1.0	—
Lamotrigine related compound C	1.7	0.3
Lamotrigine dimer ^a	6.0	0.2
Any individual unspecified degradation product	—	0.2
Total impurities	—	0.5

^aThis is either lamotrigine o-dimer [N^3,N^5 -methylenebis(6-(2,3-dichlorophenyl)-1,2,4-triazine-3,5-diamine)] or lamotrigine-dimer N^3,N^5 -methylenebis(6-(2,3-dichlorophenyl)-1,2,4-triazine-3,5-diamine).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
 - USP Lamotrigine RS

Lamotrigine Tablets for Oral Suspension

DEFINITION

Lamotrigine Tablets for Oral Suspension contain NLT 90.0% and NMT 110.0% of the labeled amount of lamotrigine ($C_9H_7Cl_2N_3$).

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

Sample: Transfer crushed powder of the Tablets for Oral Suspension, equivalent to 30 mg of lamotrigine, into an Erlenmeyer flask, and add 10 mL of chloroform. Sonicate for about 15 min. Shake the flask for another 2 min. Pass the sample through a Whatman No. 1 filter paper. Evaporate the solution to dryness. Add 250 mg of potassium bromide to the dried residue, and prepare the pellet.

Acceptance criteria: Absorption bands at 1491 cm^{-1} , 1557 cm^{-1} , 1621 cm^{-1} , 3213 cm^{-1} , 3320 cm^{-1} , and 3451 cm^{-1} are found in the *Sample* and a similarly prepared Standard.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Buffer: 0.77 g/L of ammonium acetate, adjusted with glacial acetic acid to a pH of 4.5

Mobile phase: Acetonitrile, methanol, and Buffer (30:10:60)

Diluent: Acetonitrile, methanol, and Buffer (30:30:40)

Standard solution: 0.05 mg/mL of USP Lamotrigine RS in Diluent

Sample solution: Transfer NLT 6 Tablets for Oral Suspension to a suitable volumetric flask to obtain a nominal concentration of about 0.05 mg/mL of lamotrigine. Sonicate in 70% of the flask volume of Diluent for 30 min with intermittent shaking. Dilute with Diluent to final volume, and pass a portion through a suitable membrane filter.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: 210 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0, lamotrigine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lamotrigine ($C_9H_7Cl_2N_3$), based on the label claim, in the portion of Tablets for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lamotrigine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamotrigine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL, degassed

Apparatus 2: 50 rpm

Time: 15 min

[NOTE—The *Sample solution* may be analyzed using either Chromatographic procedure 1 or Chromatographic procedure 2.]

Standard stock solution: 0.5 mg/mL of USP Lamotrigine RS in methanol

Standard solution: ($L/1000$) mg/mL of USP Lamotrigine RS in Medium from the *Standard stock solution*, where L is the Tablet label claim in mg

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Determine the amount of lamotrigine dissolved by employing one of the following chromatographic procedures.

Chromatographic procedure 1

Buffer: To 1 L of 0.77 g/L of ammonium acetate in water add 2 mL of triethylamine, and adjust with glacial acetic acid to a pH of 7.5.

Mobile phase: Acetonitrile, methanol, and Buffer (20:15:65)

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Lamotrigine Compounded Oral Suspension

DEFINITION

Lamotrigine Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of lamotrigine ($C_9H_7Cl_2N_5$).

Prepare Lamotrigine Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Lamotrigine tablet ^a equivalent to	100 mg
Ora-Blend, ^b a sufficient quantity to make	100 mL

^a Lamotrigine 100-mg tablet, Torrent Pharmaceuticals LTD, Kalamazoo, MI.

^b Perrigo, Minneapolis, MN.

Place the required number of tablet(s) in a suitable mortar, and comminute to a fine powder. Add the *Ora-Blend* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Ora-Blend* to make a lamotrigine liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Ora-Blend* to bring to final volume, and mix well.

ASSAY• **PROCEDURE**

Solution A: Dissolve 2.7 g of monobasic potassium phosphate in 1000 mL of water. Add 6.5 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.0.

Mobile phase: Acetonitrile and *Solution A* (20:80). Filter, and degas.

Diluent: 0.1 M hydrochloric acid

Standard solution: 0.4 mg/mL of USP Lamotrigine RS in *Diluent*

Sample solution: Shake thoroughly each bottle of Oral Suspension. Transfer 4 mL of Oral Suspension into a 10 mL volumetric flask, dilute with *Diluent* to volume, and mix well.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.0 mL/min

Injection volume: 5 μL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for lamotrigine is about 9.8 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lamotrigine ($C_9H_7Cl_2N_5$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lamotrigine from the *Sample solution*

r_S = peak response of lamotrigine from the *Standard solution*

C_S = concentration of lamotrigine in the *Standard solution* (mg/mL)

C_U = nominal concentration of lamotrigine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 4.0–5.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or 2°–8°.
- **LABELING:** Label it to indicate that it is to be well-shaken before use, and to state the *Beyond-Use Date*.

- **BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled room temperature or 2°–8°
- **USP REFERENCE STANDARDS (11)**
USP Lamotrigine RS

Lanolin

DEFINITION

Lanolin is the purified, wax-like substance from the wool of sheep, *Ovis aries* L. (Fam. Bovidae), that has been cleaned, decolorized, and deodorized. It contains NMT 0.25% of water. It may contain NMT 0.02% of a suitable antioxidant.

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride (221)**

Sample solution: Boil 20 mL of alcohol with 1.0 g of Lanolin under a reflux condenser. Cool, add 1 mL of 2 N nitric acid, and filter. To the filtrate add 5 drops of a solution of 20 mg/mL of silver nitrate in alcohol.

Blank: Boil 20 mL of alcohol under a reflux condenser. Cool, add 1 mL of 2 N nitric acid, and filter. To the filtrate add 5 drops of a solution of 20 mg/mL of silver nitrate in alcohol. Add 0.50 mL of 0.020 N hydrochloric acid.

Acceptance criteria: 0.035%; any turbidity produced by the *Sample solution* does not exceed that produced by the *Blank*.

FOREIGN SUBSTANCES

Use pesticide-free grade reagents and solvents throughout this test. [NOTE—Reference materials of pesticides for use in the *Standard solution* may be obtained from any commercial source.¹]

Standard stock solutions: Prepare stock solutions for each reference pesticide containing 100 mg/L in hexane.

[NOTE—Concentrated stock solutions may be stored in glass-stoppered containers in a dark refrigerator at 2°–5° for up to 1 year. Most pesticides may be dissolved directly in hexane; however, the hexachlorocyclohexane isomers and the DDT group of pesticides may require initial dissolution in the minimum volume of acetone followed by dilution with hexane to the specified concentration.]

Standard solution: Dilute volumes of the *Standard stock solutions* quantitatively with hexane, and combine to obtain a composite *Standard solution* having the concentrations indicated in Table 1. Store the composite *Standard solution* in a glass-stoppered glass container in the dark at 2°–5°, and replace it every 2 months.

[NOTE—Two or more separate composite *Standard solutions*, each preferably containing NMT 8 reference pesticides, may be prepared if needed. Reference pesticides should be selected for composite *Standard solutions* on the basis that relative retention times (see Table 1) differ sufficiently so that peaks in chromatograms will not be expected to overlap, and they should be selected and combined appropriately for the chromatographic system and detector used.]

¹ Suitable materials may be obtained from either Chem Service, 660 Tower Lane, P.O. Box 3108, Westchester, PA 19381-3108 or Greyhound, 88 Grange Road West, Birkenhead, Merseyside, L43 4XF, England U.K.

^a Suitable materials may be obtained from either Chem Service, 660 Tower Lane, P.O. Box 3108, Westchester, PA 19381-3108 or Greyhound, 88 Grange Road West, Birkenhead, Merseyside, L43 4XF, England U.K.

Gel permeation chromatography cleanup system

Eluant: Methylene chloride and hexane (1:1)

Column: 25-mm × 50-cm; packed with a slurry of 35 g of styrene-divinylbenzene copolymer beads compressed to a bed length of about 20 cm

Operating pressure: 8–11 psi

Flow rate: 5 mL/min

Set up the chromatograph, adjusting to discard the fraction eluting from 0 to 12 min. Collect the fraction eluting from 12 to 32 min, and rinse for 2 min, discarding the rinse fraction.

System suitability

Elution of lanolin: Melt a suitable quantity of Lanolin, and pass through a fluted filter paper into a container. Transfer 6.0 g to a 50-mL volumetric flask. Dilute with *Eluant* to volume, and filter. Transfer 5.0 mL of this solution to the gel permeation chromatographic column, and elute with *Eluant*. Collect 100 mL of the column effluent in tared beakers in 10-mL increments. Evaporate the solvent, cool, weigh the beakers and contents, and calculate the amount of lanolin eluted in each 10-mL increment. The column is suitable if NLT 96% of the lanolin elutes in the first 60 mL.

Elution of pesticide from lanolin: Dissolve suitable quantities of diazinon, diclofenthion, bromophos ethyl, lindane, and dieldrin in hexane to obtain a *Standard solution* having concentrations of 0.4, 0.4, 1.0, 0.1, and 0.6 µg/mL, respectively. Transfer 5.0 mL of this solution to a 10-mL volumetric flask containing 1 g of USP Lanolin RS. Dilute with methylene chloride to volume. Transfer 5 mL of this solution to the gel permeation chromatographic column, and elute with 160 mL of *Eluant*. Discard the first 60-mL fraction, and collect the next 100-mL fraction (from 60 to 160 mL). Transfer this collection fraction to a concentrator fitted with a graduated collection flask, add 50 mL of hexane, and concentrate by evaporation to 5 mL. Inject this fraction into the chromatographs described in *Chromatographic system I* and *Chromatographic system II*. Record the chromatograms, and measure the heights of the peaks obtained from the five pesticides in the *Standard solution*. Calculate the recoveries of each of the five pesticides used in the fortified USP Lanolin RS solution.

Prepare a test solution by mixing hexane with the *Standard solution* (1:1). Inject this into the chromatographs described in *Chromatographic system I* and *Chromatographic system II*. Record the chromat-

ograms, and measure the peak heights of the five pesticides in the chromatogram of the *Sample solution*. Compare the peak heights from the fraction of the *Standard solution* to the peak heights of the corresponding pesticides from the *Sample solution*: NLT 85% of the added amounts of each of the five pesticides is recovered.

Sample solution: Transfer 6 g of Lanolin, previously melted to liquid form by heating on a hot water bath if necessary, to a 50-mL volumetric flask. Dissolve in 25 mL of *Eluant*, dilute with *Eluant* to volume, and filter. Transfer 5.0 mL of this solution to the column, and elute with 160 mL of *Eluant*. Discard the first 60-mL fraction, and collect the remaining fraction in a suitable evaporator. Concentrate by evaporation on a steam bath to 3 mL, add 50 mL of hexane, and evaporate again to remove all traces of methylene chloride, adjusting the volume with hexane to 3.0 mL.

Chromatographic system I

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Electron capture

Column: 0.53-mm × 30-m fused silica capillary; bonded with a 1.5-µm layer of phase G1, and a 0.53-mm × 6-m fused silica uncoated guard column connected to a modified packed column-type injector system

Column temperature: 200°. [NOTE—The initial temperature of the column may be adjusted so that the retention times of ethion and *p,p'*-DDT are 2.56 and 3.1, respectively, relative to chlorpyrifos.]

Carrier gas: Helium

Flow rate: 25 mL/min. Adjust so that the retention time of chlorpyrifos is 4 min.

Makeup gas: Nitrogen, 40 mL per minute

Injection volume: 5 µL

Chromatographic system II

Mode: GC

Detector: Flame photometric

Column: 0.53-mm × 30-m fused silica capillary; bonded with a 1.0-µm layer of phase G3, and a 0.53-mm × 6-m fused silica uncoated guard column connected to a modified packed column-type injector system

Column temperature: 200°. [NOTE—The initial temperature of the column may be adjusted so that the retention time of ethion is 3.36 relative to that of chlorpyrifos.]

Carrier gas: Helium
 Flow rate: 25 mL/min. Adjust so that the retention time of chlorpyrifos is 4 min.
 Makeup gas: Nitrogen, 40 mL/min
 Injection volume: 5 μ L

Analysis

The following procedure is to be followed for *Chromatographic systems I and II*.

Samples: *Standard solution* and *Sample solution*
 Calculate the quantity of the individual specified residue found in the sample taken:

$$\text{Result} = (r_u/r_s) \times (C/W) \times 30$$

r_u = peak area of each residue from the *Sample solution*
 r_s = peak area of each residue from the *Standard solution*
 C = concentration of the reference pesticide in the *Standard solution* (mg/L)
 W = weight of Lanolin taken (g)

Acceptance criteria

Individual specified residue: NMT 10 ppm
 Total specified residue: NMT 40 ppm

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE, Class II (741)**
Analysis: Determine on a sample previously cooled to 8°–10°.
Acceptance criteria: 38°–44°
- **FATS AND FIXED OILS, Acid Value (Free Fatty Acids) (401)**
Sample: 10.0 g
Acceptance criteria: The free acids obtained from the *Sample* require NMT 2.0 mL of 0.10 N sodium hydroxide for neutralization.
- **FATS AND FIXED OILS, Iodine Value (401)**
Sample: 780–820 mg
Acceptance criteria: 18–36
- **ALKALINITY**
Sample: 2.0 g
Analysis: Dissolve the *Sample* in 10 mL of ether, and add 2 drops of phenolphthalein TS.
Acceptance criteria: The liquid is not colored red.
- **WATER-SOLUBLE ACIDS AND ALKALIES**
Sample: 10.0 g
Analysis: Warm the *Sample* with 50 mL of water on a steam bath, constantly stirring the mixture until the Lanolin is melted.
Acceptance criteria: The fat separates completely on cooling, leaving the water layer nearly clear and neutral to litmus. Retain the water layer for the test for *Water-Soluble Oxidizable Substances* and *Ammonia*.
- **WATER-SOLUBLE OXIDIZABLE SUBSTANCES**
Sample solution: 10 mL of the solution from *Water-Soluble Acids and Alkalies*
Analysis: Add the *Sample solution* to 50 μ L of 0.10 N potassium permanganate.
Acceptance criteria: The resulting solution does not completely decolorize within 10 min.
- **AMMONIA**
Sample solution: 10 mL of the solution from *Water-Soluble Acids and Alkalies*
Analysis: Add 1 mL of 1 N sodium hydroxide to the *Sample solution*, and boil.
Acceptance criteria: The vapors do not turn red litmus to blue.
- **WATER DETERMINATION, Method I (921)**
Solution A: Chloroform and methanol (3:2)
Sample solution: 250 mg/mL of Lanolin in *Solution A*
Analysis: Determine the water content of a 10.0-mL portion of the *Sample solution*. Perform a blank determination on 10.0 mL of *Solution A*, and make any necessary correction.

Acceptance criteria: NMT 0.25%

PETROLATUM

Sample: 3 g

Analysis: Heat the *Sample* on a steam bath, with frequent stirring, until its weight loss is NLT its water content. Boil 40 mL of dehydrated alcohol with 500 mg of the dried lanolin so obtained.

Acceptance criteria: The solution is clear or NMT opalescent.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, preferably at controlled room temperature.
- **LABELING:** The label states that it is not to be used undiluted.
- **USP REFERENCE STANDARDS (11)**
 USP Lanolin RS

Modified Lanolin

DEFINITION

Modified Lanolin is the purified wax-like substance from the wool of sheep, *Ovis aries* L. (Fam. Bovidae), that has been processed to reduce the contents of free lanolin alcohols and residues of detergent and pesticide. It contains NMT 0.25% of water. It may contain NMT 0.02% of a suitable antioxidant.

IMPURITIES

LIMIT OF FREE LANOLIN ALCOHOLS

Gel permeation chromatographic cleanup system

Eluant: Methylene chloride

Column: 25-mm \times 100-cm; packed with a slurry of styrene-divinylbenzene copolymer beads compressed to a bed length of approximately 77 cm

Flow rate: 4 mL/min

Set up the chromatograph, adjusting to discard the fraction eluting from 0 to 43 min. Collect the fraction eluting from 43 to 60 min, and rinse for 20 min, discarding the rinse fraction.

System suitability

Elution of lanolin alcohols: Melt a suitable quantity of USP Lanolin Alcohols RS, and pass through a fluted filter paper into a container. Transfer 1.0 g to a 10-mL volumetric flask. Dilute with *Eluant* to volume. Transfer 5 mL to the gel permeation chromatographic column, and elute with *Eluant*. Collect 172–240 mL of the column effluent in a suitable evaporator. Evaporate the solvent, cool, weigh the evaporator, and calculate the amount of lanolin alcohols eluted in the evaporator. The column is suitable if NLT 99% of the lanolin alcohols elute in the first 172–240 mL.

Standard solution: 0.5 mg/mL of USP Lanolin Alcohols RS in hexane. Store this solution in a cold, dark place for up to 4 weeks. Before using, warm just sufficiently to dissolve any precipitate if necessary.

Sample solution: Transfer 1 g of Modified Lanolin, previously melted to liquid form by heating on a hot water bath if necessary, to a 10-mL volumetric flask. Dissolve in 7 mL of *Eluant*, dilute with *Eluant* to volume, and filter. Transfer 5.0 mL of this solution to the column, and elute with 320 mL of *Eluant*. Discard the first 172-mL fraction, and collect the next 68-mL fraction (from 172 to 240 mL) in a suitable evaporator. Concentrate by evaporation on a steam bath to 3 mL. Add 50 mL of hexane, and transfer this solution to a 100-mL volumetric flask, adjusting the volume with hexane to 100 mL.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Columns

Guard: 0.32-mm × 50-cm fused silica uncoated

Analytical: 0.33-mm × 50-m fused silica capillary;
bonded with a 0.50-μm layer of phase G2**Temperatures**

Detector: 290°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
210	3	280	—

Flow rate: 7 mL/min

Carrier gas: Nitrogen

Makeup gas: Nitrogen at 50 mL/min

Injection volume: 1 μL

Analysis**Samples:** *Standard solution* and *Sample solution*[NOTE—Allow both the *Standard solution* and the *Sample solution* to elute for NLT 40 min.]

Calculate the percentage of free lanolin alcohols in the portion of Modified Lanolin taken:

$$\text{Result} = (r_u/r_s) \times [(C \times K)/(I \times W)] \times 100$$

 r_u = total peak response from the *Sample solution* r_s = total peak response from the *Standard solution* C = concentration of USP Lanolin Alcohols RS in the *Standard solution* (mg/mL) I = volume injected into the gel permeation chromatography column (mL) W = weight of Modified Lanolin taken (g) K = corrected fraction of free lanolin alcohols in the USP Lanolin Alcohols RS in the *Standard solution* taken:

$$K = 1 + (0.0062A - 0.0119S)$$

 A = acid value of USP Lanolin Alcohols RS S = saponification value of USP Lanolin Alcohols RS

Acceptance criteria: NMT 6%

• FOREIGN SUBSTANCESUse pesticide-free grade reagents and solvents throughout this test. [NOTE—Reference materials of pesticides for use in the *Standard solution* may be obtained from any commercial source.¹]**Standard stock solutions:** Prepare stock solutions for each reference pesticide containing 100 mg/L in hexane.

[NOTE—Concentrated stock solutions may be stored in glass-stoppered containers in a dark refrigerator at 2°–5° for up to 1 year. Most pesticides may be dissolved directly in hexane; however, the hexachlorocyclohexane isomers and the DDT group of pesticides may require initial dissolution in the minimum volume of acetone followed by dilution with hexane to the specified concentration.]

Standard solution: Dilute volumes of the *Standard stock solutions* quantitatively with hexane, and combine to obtain a composite *Standard solution* having the concentrations indicated in Table 2. Store the composite *Standard solution* in a glass-stoppered glass container in the dark at 2°–5°, and replace it every 2 months.[NOTE—Two or more separate composite *Standard solutions*, each preferably containing NMT 8 reference pesticides, may be prepared if needed. Reference pesticides should be selected for composite *Standard solutions* on the basis that relative retention times (see Table 2) differ sufficiently so that peaks in chromatograms will not be expected to overlap, and they should be selected and combined appropriately for the chromatographic system and detector used.]¹ Suitable materials may be obtained from either Chem Service, 660 Tower Lane, P.O. ^a Suitable materials may be obtained from either Chem Service, 660 Tower Lane, P.O. Box 3108, Westchester, PA 19381-3108 or Greyhound, 88 Grange Road West, Birkenhead, Merseyside, L43 4XF, England U.K.

Gel permeation chromatography cleanup system

Eluant: Methylene chloride and hexane (1:1)

Column: 25-mm × 50-cm; packed with a slurry of 35 g of styrene-divinylbenzene copolymer beads compressed to a bed length of about 20 cm

Operating pressure: 8–11 psi

Flow rate: 5 mL/min. Set up the chromatograph, adjusting to discard the fraction eluting from 0 to 12 min. Collect the fraction eluting from 12 to 32 min, and rinse for 2 min, discarding the rinse fraction.

System suitability

Elution of lanolin: Melt a suitable quantity of Lanolin, and pass through a fluted filter paper into a container. Transfer 6.0 g to a 50-mL volumetric flask. Dilute with *Eluant* to volume, and filter. Transfer 5.0 mL of this solution to the gel permeation chromatographic column, and elute with *Eluant*. Collect 100 mL of the column effluent in tared beakers in 10-mL increments. Evaporate the solvent, cool, weigh the beakers and contents, and calculate the amount of lanolin eluted in each 10-mL increment. The column is suitable if NLT 96% of the lanolin elutes in the first 60 mL.

Elution of pesticide from lanolin: Dissolve suitable quantities of diazinon, diclofenthion, bromophos ethyl, lindane, and dieldrin in hexane to obtain a *Standard solution* having concentrations of 0.4, 0.4, 1.0, 0.1, and 0.6 µg/mL, respectively. Transfer 5.0 mL of this solution to a 10-mL volumetric flask containing 1 g of USP Lanolin RS. Dilute with methylene chloride to volume. Transfer 5 mL of this solution to the gel permeation chromatographic column, and elute with 160 mL of *Eluant*. Discard the first 60-mL fraction, and collect the next 100-mL fraction (from 60 to 160 mL). Transfer this collection fraction to a concentrator fitted with a graduated collection flask, add 50 mL of hexane, and concentrate by evaporation to 5 mL. Inject this fraction into the chromatographs described in *Chromatographic system I* and *Chromatographic system II*. Record the chromatograms, and

measure the heights of the peaks obtained from the five pesticides in the *Standard solution*. Calculate the recoveries of each of the five pesticides used in the fortified USP Lanolin RS solution.

Prepare a test solution by mixing hexane with the *Standard solution* (1:1). Inject into the chromatographs described in *Chromatographic system I* and *Chromatographic system II*. Record the chromatograms, and measure the peak heights of the five pesticides in the chromatogram of the *Sample solution*. Compare the peak heights from the fraction of the *Standard solution* to the peak heights of the corresponding pesticides from the *Sample solution*: NLT 85% of the added amounts of each of the five pesticides is recovered.

Sample solution: Transfer 6 g of Lanolin, previously melted to liquid form by heating on a hot water bath if necessary, to a 50-mL volumetric flask. Dissolve in 25 mL of *Eluant*, dilute with *Eluant* to volume, and filter. Transfer 5.0 mL of this solution to the column, and elute with 160 mL of *Eluant*. Discard the first 60-mL fraction, and collect the remaining fraction in a suitable evaporator. Concentrate by evaporation on a steam bath to 3 mL, add 50 mL of hexane, and evaporate again to remove all traces of methylene chloride, adjusting the volume with hexane to 3.0 mL.

Chromatographic system I
(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Electron capture

Column: 0.53-mm × 30-m fused silica capillary; bonded with a 1.5-µm layer of phase G1, and a 0.53-mm × 6-m fused silica uncoated guard column connected to a modified packed column-type injector system

Column temperature: 200°. [NOTE—The initial temperature of the column may be adjusted so that the retention times of ethion and *p,p'*-DDT are 2.56 and 3.1, respectively, relative to chlorpyrifos.]

Carrier gas: Helium

Flow rate: 25 mL/min. Adjust so that the retention time of chlorpyrifos is 4 min.

Makeup gas: Nitrogen, 40 mL/min

Injection volume: 5 μ L

Chromatographic system II

Mode: GC

Detector: Flame photometric

Column: 0.53-mm \times 30-m fused silica capillary; bonded with a 1.0- μ m layer of phase G3, and a 0.53-mm \times 6-m fused silica uncoated guard column connected to a modified packed column-type injector system

Column temperature: 200°. [NOTE—The initial temperature of the column may be adjusted so that the retention time of ethion is 3.36 relative to that of chlorpyrifos.]

Carrier gas: Helium

Flow rate: 25 mL/min. Adjust so that the retention time of chlorpyrifos is 4 min.

Makeup gas: Nitrogen, 40 mL/min

Injection volume: 5 μ L

Analysis

The following procedure is to be followed for *Chromatographic systems I and II*.

Samples: *Standard solution* and *Sample solution*

Inject the appropriate composite *Standard solution* and the *Sample solution* into the gas chromatograph, record the chromatograms, and measure the areas of all the peaks observed in the chromatograms. Compare the peak areas of any of the pesticide residues in the *Sample solution* from each chromatographic system with the peak areas that correspond to the retention times in the appropriate composite *Standard solution* from each corresponding chromatographic system.

Calculate the quantity, in ppm, of the individual specified residue found in the sample taken:

$$\text{Result} = (r_u/r_s) \times (C/W) \times 30$$

r_u = peak area of each residue from the *Sample solution*

r_s = peak area of each residue from the *Standard solution*

C = concentration of the reference pesticide in the *Standard solution* (mg/L)

W = weight of Lanolin taken (g)

Acceptance criteria

Individual specified residue: NMT 1 ppm

Total specified residues: NMT 3 ppm

SPECIFIC TESTS

• FATS AND FIXED OILS, Acid Value (Free Fatty Acids) (401)

Sample: 12.5 g

Acceptance criteria: The free acids obtained from the *Sample* require NMT 2.0 mL of 0.10 N sodium hydroxide for neutralization.

• ALKALINITY

Sample: 2.5 g

Analysis: Dissolve the *Sample* in 10 mL of ether, and add 2 drops of phenolphthalein TS.

Acceptance criteria: No red color is produced.

• WATER-SOLUBLE ACIDS AND ALKALIES

Sample: 12.5 g

Analysis: Warm the *Sample* with 50 mL of water on a steam bath, constantly stirring the mixture until the Lanolin is melted.

Acceptance criteria: The fat separates completely on cooling, leaving the water layer nearly clear and neutral to litmus. Retain the water layer for the test for *Ammonia*.

• AMMONIA

Sample solution: 10 mL of the solution from *Water-Soluble Acids and Alkalies*

Analysis: Add 1 mL of 1 N sodium hydroxide to the *Sample solution*, and boil.

Acceptance criteria: The vapors do not turn red litmus to blue.

• WATER DETERMINATION, Method I (921)

Solution A: Chloroform and methanol (3:2)

Sample solution: 250 mg/mL of Modified Lanolin in *Solution A*

Analysis: Determine the water content of a 10.0-mL portion of the *Sample solution*. Perform a blank determination on 10.0 mL of *Solution A*, and make any necessary correction.

Acceptance criteria: NMT 0.25%

• PETROLATUM

Sample: 3 g

Analysis: Heat the *Sample* on a steam bath, with frequent stirring, until it loses about 0.25% of its weight. Boil 40 mL of dehydrated alcohol with 500 mg of the dried lanolin so obtained.

Acceptance criteria: The solution is clear or NMT opalescent.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, preferably rust-proof containers, preferably at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Lanolin RS

USP Lanolin Alcohols RS

Lansoprazole

$C_{16}H_{14}F_3N_3O_2S$ 369.36

1*H*-Benzimidazole, 2-[[[3-methyl-4-(2,2,2-trifluoroethoxy)-2-pyridinyl]methyl]sulfinyl]-; 2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-2-pyridyl]-methyl]sulfinyl]benzimidazole [103577-45-3].

DEFINITION

Lansoprazole contains NLT 98.0% and NMT 102.0% of $C_{16}H_{14}F_3N_3O_2S$.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. ULTRAVIOLET ABSORPTION (197U)

Sample solution: 10 μ g/mL in methanol

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, water, and triethylamine (40:60:1). Adjust with phosphoric acid to a pH of 7.0.

Diluent: Acetonitrile, water, and triethylamine

(40:60:1). Adjust with phosphoric acid to a pH of 10.0.

System suitability solution: 0.1 mg/mL of USP Lansoprazole RS and 0.1 mg/mL of USP Lansoprazole Related Compound A RS in *Diluent*

Standard solution: 0.1 mg/mL of USP Lansoprazole RS in *Diluent*

Sample solution: 0.1 mg/mL of Lansoprazole in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection size: 10 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 5 between lansoprazole and lansoprazole related compound A, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lansoprazole

(C₁₆H₁₄F₃N₃O₂S) in the portion of Lansoprazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lansoprazole RS in the *Standard solution* (mg/mL)

C_U = concentration of Lansoprazole in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Organic Impurities

• PROCEDURE

[NOTE—Store and inject the lansoprazole solutions at or below 5° using a cooled autosampler. The solutions are stable for about 24 h when stored at 5°.]

Solution A: Water

Solution B: Acetonitrile, water, and triethylamine (160:40:1). Adjust with phosphoric acid to a pH of 7.0.

Diluent: Methanol and 0.1 N sodium hydroxide (1:3)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
40	20	80
50	20	80
51	90	10
60	90	10

System suitability solution: Prepare a solution containing 25 μg/mL of USP Lansoprazole RS and 25 μg/mL of USP Lansoprazole Related Compound A RS in methanol. Transfer 1 mL of this solution into a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Standard solution: Prepare a solution containing 25 μg/mL of USP Lansoprazole RS and 25 μg/mL of USP Lansoprazole Related Compound B RS in methanol. Transfer 1 mL of this solution into a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Sample solution: 2.5 mg/mL of Lansoprazole in methanol. Transfer 1 mL of this solution into a 10-mL volumetric flask, and dilute with *Diluent* to volume.

Blank: Methanol and *Diluent* (1:9)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 0.8 mL/min

Injection size: 40 μL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 6 between lansoprazole and lansoprazole related compound A

Relative standard deviation: NMT 3%

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Identify the lansoprazole peak and the peaks due to the impurities listed in *Table 2*. Measure the areas for the major peaks, excluding peaks obtained from the *Blank*.

Calculate the percentage of lansoprazole related compound B in the portion of Lansoprazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for lansoprazole related compound B from the *Sample solution*

r_S = peak response for lansoprazole related compound B from the *Standard solution*

C_S = concentration of USP Lansoprazole Related Compound B RS in the *Standard solution* (μg/mL)

C_U = concentration of Lansoprazole in the *Sample solution* (μg/mL)

Calculate the percentage of lansoprazole *N*-oxide, lansoprazole sulfone, and any other individual impurity in the portion of Lansoprazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response for lansoprazole from the *Standard solution*

C_S = concentration of USP Lansoprazole RS in the *Standard solution* (μg/mL)

C_U = concentration of Lansoprazole in the *Sample solution* (μg/mL)

F = relative response factor for each impurity (see *Table 2*)

Acceptance criteria

Individual impurities: See *Table 2*. Disregard any peak below 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lansoprazole <i>N</i> -oxide ^a	0.8	1.3	0.1
Lansoprazole	1.0	—	—
Lansoprazole related compound A (lansoprazole sulfone) ^b	1.1	0.82	0.4

USP Lansoprazole Related Compound B RS

2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-pyridin-2-yl]methyl]sulfonyl]-1*H*-benzimidazole.

C₁₆H₁₄F₃N₃OS 353.36

Lansoprazole Delayed-Release Capsules

» Lansoprazole Delayed-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lansoprazole (C₁₆H₁₄F₃N₃O₂S).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards (11)—

USP Lansoprazole RS

C₁₆H₁₄F₃N₃O₂S 369.36

USP Lansoprazole Related Compound A RS

2-[[[3-Methyl-4-(2,2,2-trifluoroethoxy)-2-pyridyl]methyl]sulfonyl]benzimidazole.

C₁₆H₁₄F₃N₃O₃S 385.36

Identification—

A: Ultraviolet Absorption (197U)—

Medium: methanol.

Procedure—Powder a portion of Capsule contents equivalent to 5 mg of lansoprazole. Add 5 mL of methanol, shake well, and centrifuge. To 0.1 mL of the supernatant, add 10 mL of methanol.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—Proceed as directed for *Procedure for Method A* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

ACID STAGE—

Acid stage medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Withdraw a 25-mL aliquot and then proceed immediately as directed for *Test solution* in the *Buffer stage*, leaving the remaining 475 mL in the vessel for use in the *Buffer stage*. Using a filtered portion of the aliquot, determine the amount of C₁₆H₁₄F₃N₃O₂S dissolved by employing UV absorption at the wavelength of maximum absorbance at about 306 nm, using *Acid stage medium* as the blank. Concomitantly determine the absorbance of the *Acid stage test solution* in comparison with a Standard solution of USP Lansoprazole RS having a known concentration equivalent to about 8% of the labeled amount of lansoprazole dissolved per 500 mL of *Acid stage medium*. [NOTE—A volume of methanol not to exceed 0.5% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Acid stage medium*.]

Tolerances—Not more than 10% of the labeled amount of C₁₆H₁₄F₃N₃O₂S is dissolved in 60 minutes.

BUFFER STAGE—

Buffer concentrate—Transfer 65.4 g of monobasic sodium phosphate, 28.2 g of sodium hydroxide, and 12 g of sodium dodecyl sulfate to a suitable container, and add enough water to dissolve. Dilute with water to 4 L, and mix well.

Blank solution—Prepare a mixture of *Acid stage medium* and *Buffer concentrate* (19:17). Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Test solution—Add 425 mL of *Buffer concentrate* to the remaining 475 mL of solution in each vessel from the *Acid stage*. Adjust, if necessary, with either phosphoric acid or sodium hydroxide to a pH of 6.8.

Apparatus 2: 75 rpm.

Time: 60 minutes.

Procedure—Determine the amount of C₁₆H₁₄F₃N₃O₂S dissolved in filtered portions of the *Test solution*, using the difference between the absorbances at the wavelengths of about 286 nm and 650 nm, with *Blank solution* as the blank. Concomitantly determine the absorbances of the *Test solution* in comparison with a Standard solution of USP Lansoprazole RS having a known concentration equivalent to about 70% of the labeled amount of lansoprazole dissolved in 900 mL of *Blank solution*. [NOTE—An amount of methanol not to exceed 2% of the total volume of the Standard solution may be used to dissolve USP Lansoprazole RS prior to dilution with *Blank solution*.]

Tolerances—Not less than 80% (Q) of the labeled amount of C₁₆H₁₄F₃N₃O₂S is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Test solution—Transfer the contents of 1 Capsule to a 100-mL volumetric flask, add 30 mL of 0.1 M sodium hydroxide, and sonicate to disintegrate. Add 65 mL of acetonitrile, cool, and dilute with acetonitrile to volume. Centrifuge a portion of the suspension and pass through a membrane filter having a 0.5-μm or finer porosity. Quantitatively dilute a volume of the filtrate with a mixture of acetonitrile and 0.1 M sodium hydroxide (7:3) to obtain a solution containing about 0.012 mg of lansoprazole per mL.

Procedure—Concomitantly determine the absorbances of the *Test solution* and a solution of USP Lansoprazole RS in the same medium and having a known concentration of about 0.012 mg of lansoprazole per mL, in 1-cm cells, at the wavelength of maximum absorbance at about 294 nm, with a suitable spectrophotometer, using a mixture of acetonitrile and 0.1 M sodium hydroxide (7:3) as the blank.

Calculate the quantity, in mg, of $C_{16}H_{14}F_3N_3O_2S$ in the Capsule taken by the formula:

$$(LC/D)(A_U / A_S)$$

in which L is the labeled quantity of lansoprazole in the Capsule; C is the concentration, in mg per mL, of USP Lansoprazole RS in the Standard solution; D is the concentration, in mg per mL, of lansoprazole in the Test solution, based on the labeled quantity of lansoprazole per Capsule and the extent of dilution; and A_U and A_S are the absorbances of the Test solution and the Standard solution, respectively.

Loss on drying (731)—Dry about 1 g of the Capsule contents in vacuum over phosphorus pentoxide at a pressure not exceeding 5 mm of mercury at 60° for 5 hours; it loses not more than 5.0% of its weight.

Assay—

Diluent, Mobile phase, and Resolution solution—Prepare as directed in the Assay under Lansoprazole.

Internal standard solution—Dissolve an accurately weighed quantity of 4'-ethoxyacetophenone in acetonitrile to obtain a solution having a known concentration of about 7.5 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Lansoprazole RS in a mixture of 0.1 M sodium hydroxide and acetonitrile (3:2) to obtain a solution having a known concentration of 3.0 mg per mL. Transfer 25.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix. Quantitatively dilute with *Diluent* to obtain a solution having a known concentration of about 0.1 mg of USP Lansoprazole RS per mL.

Assay preparation—Transfer the contents of not fewer than 10 Capsules, equivalent to about 300 mg of lansoprazole, to a 300-mL conical flask containing 60.0 mL of 0.1 M sodium hydroxide, and sonicate until completely disintegrated. Add 20.0 mL of acetonitrile and 20.0 mL of *Internal standard solution*, shake well, and centrifuge a portion of the suspension. Quantitatively dilute a volume of the supernatant with *Diluent* to obtain a solution containing about 0.1 mg of lansoprazole per mL, and pass through a membrane filter having a 0.5- μ m or finer porosity.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 285-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*; the resolution, R , between the two major peaks is not less than 5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*; the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of lansoprazole ($C_{16}H_{14}F_3N_3O_2S$) in each Capsule taken by the formula:

$$(LC/D)(R_U / R_S)$$

in which L is the labeled quantity, in mg, of lansoprazole in each Capsule taken; C is the concentration, in mg per mL, of USP Lansoprazole RS in the *Standard preparation*; D is the concentration, in mg per mL, of lansoprazole in the *Assay preparation*, based on the labeled quantity of lansoprazole in the Capsules taken and the extent of dilution; and R_U and R_S are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lansoprazole Compounded Oral Suspension

DEFINITION

Lansoprazole Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of lansoprazole ($C_{16}H_{14}F_3N_3O_2S$). Prepare Lansoprazole Compounded Oral Suspension 3 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Lansoprazole delayed-release capsule(s) ^a equivalent to	300 mg
Vehicle: A mixture of Ora-Blend ^b and Sodium Bicarbonate Injection (8.4%) (1:1), a sufficient quantity to make	100 mL

^a Lansoprazole 30-mg delayed-release capsules, Dr. Reddy's Laboratory Limited, Bridgewater, NJ.

^b Perrigo Pharmaceuticals, Allegan, MI.

Empty the required number of delayed-release capsules, and pour the contents into a mortar or other suitable container. If necessary, crush the contents into a fine powder by using a pestle or other mechanical means. Wet the powder with a small amount of *Vehicle*, and triturate to make a smooth paste. Add *Vehicle* to make the mortar contents pourable. Transfer the contents stepwise and quantitatively to a calibrated container using the remainder of *Vehicle*. Add sufficient *Vehicle* to bring to final volume. Shake to mix well.

Alternatively, a compounded 8.4% sodium bicarbonate solution may be used instead of *Sodium Bicarbonate Injection* (8.4%). Prepare an 8.4% sodium bicarbonate solution by dissolving 8.4 g of Sodium Bicarbonate in sufficient Purified Water to make 100 mL.

ASSAY

PROCEDURE

Solution A: 10 mM sodium phosphate adjusted with sodium hydroxide to a pH of 7.5. Pass through a nylon filter of 0.45- μ m pore size, and degas.

Solution B: Acetonitrile and water (50:50)

Solution C: Water adjusted with 1 M sodium hydroxide to a pH of 6.5

Mobile phase: Acetonitrile and *Solution A* (45:55)

Standard stock solution: 3 mg/mL of USP Lansoprazole RS in *Solution B*. Mix well, and sonicate for 3 min. Store at 2°–8°.

Standard solution: Transfer 2.0 mL of the *Standard stock solution* to a 500-mL volumetric flask, and dilute with *Solution C* to volume. Centrifuge an aliquot of the solution for 5 min at 14,000 rpm, and use the supernatant. Protect from light, and store at 2°–8°.

Sample solution: Shake each bottle of Oral Suspension thoroughly. Transfer 2.0 mL of Oral Suspension to a 500-mL volumetric flask, and dilute with *Solution C* to volume. Centrifuge an aliquot of the solution for 5 min at 14,000 rpm, and use the supernatant. Protect from light, and store at 2°–8°.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 285 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Temperatures

Column: 35°

Autosampler: 5°

Diluent: Acetonitrile and water (30:70)

Standard solution: 1.0 µg/mL of USP Latanoprost Related Compound E RS in *Diluent*

Sample solution: 1.0 mg/mL of Latanoprost in *Diluent*
Chromatographic system
 (See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.0-mm × 15-cm; 5-µm packing L1

Column temperature: 60°

Flow rate: 1.0 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of latanoprost related compound E in the portion of Latanoprost taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of latanoprost related compound E from the *Sample solution*

r_S = peak area of latanoprost related compound E from the *Standard solution*

C_S = concentration of USP Latanoprost Related Compound E RS in the *Standard solution* (mg/mL)

C_U = concentration of Latanoprost in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.2%

SPECIFIC TESTS

• OPTICAL ROTATION, *Specific Rotation* (781S)

Sample solution: 10 mg/mL of Latanoprost in acetonitrile

Acceptance criteria: +31° to +38°

• WATER DETERMINATION, *Method 1c* (921)

Sample solution: 100 mg/mL of Latanoprost in ethyl acetate. [NOTE—Alternatively, *Water Determination* (921), *Method 1a* may be used.]

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store in a refrigerator or a freezer.

• USP REFERENCE STANDARDS (11)

USP Latanoprost RS

USP Latanoprost Related Compound A RS

Isopropyl (E)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-dihydroxy-2-[(3*R*)-3-hydroxy-5-phenylpentyl]cyclopentyl]-5-heptenoate.

$C_{26}H_{40}O_5$ 432.59

USP Latanoprost Related Compound E RS

(Z)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(3*R*)-3-hydroxy-5-phenylpentyl]cyclopentyl]-5-heptenoic acid.

$C_{23}H_{34}O_5$ 390.51

Leflunomide

$C_{12}H_9F_3N_2O_2$ 270.21
 4-Isioxazolecarboxamide, 5-methyl-N-[4-(trifluoromethyl)-phenyl]-;

α,α,α -Trifluoro-5-methyl-4-isoxazolecarboxy-*p*-toluidide [75706-12-6].

DEFINITION

Leflunomide contains NLT 98.0% and NMT 102.0% of $C_{12}H_9F_3N_2O_2$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
Sample: Dry the substance for 10 min at 130°.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Mobile phase: Acetonitrile, triethylamine, and water (70:1:130). Adjust with phosphoric acid to a pH of 4.
Standard solution: 0.5 mg/mL of USP Leflunomide RS in acetonitrile and *Mobile phase* (1:9). [NOTE—First dissolve in acetonitrile. Protect solutions from light.]

System suitability solution: 0.5 mg/mL of USP Leflunomide RS, 0.15 mg/mL of USP Leflunomide Related Compound B RS, and 0.05 mg/mL of USP Leflunomide Related Compound C RS in *Mobile phase*. [NOTE—Dissolve the Reference Standards in acetonitrile, and dilute with *Mobile phase*.]

Sample solution: 0.5 mg/mL of Leflunomide in acetonitrile and *Mobile phase* (1:9). [NOTE—First dissolve in acetonitrile. Protect solutions from light.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4-mm × 12.5-cm; packing L1

Flow rate: 1 mL/min

Injection size: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for leflunomide related compound B and leflunomide related compound C are 0.2 and 0.9, respectively.]

Suitability requirements

Resolution: NLT 1.0 between the leflunomide and leflunomide related compound C peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{12}H_9F_3N_2O_2$ in the portion of Leflunomide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Leflunomide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of Leflunomide in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES**Inorganic Impurities**

Organic Impurities

- **PROCEDURE 1: LIMIT OF LEFLUNOMIDE RELATED COMPOUND A**
Mobile phase, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard stock solution: 0.125 mg/mL of USP Leflunomide Related Compound A RS, in acetonitrile and *Mobile phase* (1:19)

Standard solution: 0.5 µg/mL of USP Leflunomide Related Compound A RS, from the *Standard stock solution* in *Mobile phase*

Sample solution: 2.5 mg/mL of Leflunomide, in acetonitrile and *Mobile phase* (1:9)

Injection size: 20 µL

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the percentage of leflunomide related compound A in the portion of Leflunomide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of leflunomide related compound A from the *Sample solution*

r_S = peak area of leflunomide related compound A from the *Standard solution*

C_S = concentration of USP Leflunomide Related Compound A RS in the *Standard solution* (mg/mL)

C_U = concentration of Leflunomide in the *Sample solution* (mg/mL)

Acceptance criteria: NMT 0.02 %

• **PROCEDURE 2**

Mobile phase, Sample solution, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.5 µg/mL of USP Leflunomide RS, from the *Standard solution* in *Mobile phase*

Sensitivity solution: 0.25 µg/mL of Leflunomide, from the *Standard solution* in *Mobile phase*

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Resolution: NLT 1.0 between leflunomide and leflunomide related compound C

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Disregard any peak with an area less than the leflunomide peak from the *Sensitivity solution*. Continue the elution for two times the retention time of the leflunomide peak.]

Calculate the percentage of each related compound and any unknown impurity (see *Impurity Table 1*) in the portion of Leflunomide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area for each impurity from the *Sample solution*

r_S = peak area of leflunomide from the *Standard solution*

C_S = concentration of USP Leflunomide RS in the *Standard solution* (mg/mL)

C_U = concentration of Leflunomide in the *Sample solution* (mg/mL)

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
5-Methylisoxazole-carboxylic acid	0.05	1.0	0.1
Leflunomide related compound B	0.22	1.0	0.3
N-(2'-Trifluoromethyl-phenyl)-5-methylisoxazole-4-Carboxamide	0.29	1.0	0.1
2-Cyano-acetic acid-(4'-trifluoromethyl)-anilide	0.36	1.0	0.1
Leflunomide related compound C	0.94	1.0	0.1
Any other individual impurity	—	—	0.1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Total impurities, excluding leflunomide related compound B and leflunomide related compound C	—	—	0.2
Total impurities	—	—	0.4

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE (741):** 164°–168°
- **LOSS ON DRYING (731):** Dry a sample in a vacuum over diphosphorus pentoxide at 60° for 4 h; it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in a well-closed container. Store at a temperature not exceeding 30°.
- **USP REFERENCE STANDARDS (11)**
 - USP Leflunomide RS
 - USP Leflunomide Related Compound A RS
 - USP Leflunomide Related Compound B RS
 - USP Leflunomide Related Compound C RS

Leflunomide Tablets**DEFINITION**

Leflunomide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of leflunomide ($C_{12}H_9F_3N_2O_2$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION (197U)**
 - Wavelength range: 220–360 nm
 - Sample solution: 0.01 mg/mL in methanol
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Mobile phase: Acetonitrile, triethylamine, and water (70:1:130). Adjust with phosphoric acid to a pH of 4.0.

System suitability solution A: 10 µg/mL of USP Leflunomide Related Compound A RS, 1 mg/mL of USP Leflunomide Related Compound B RS, and 100 µg/mL of USP Leflunomide Related Compound C RS in a minimum amount of acetonitrile, and diluted with *Mobile phase*.

System suitability solution B: Transfer 100.0 mg of USP Leflunomide RS to a 100-mL volumetric flask. Dissolve in 2 mL of acetonitrile, add 1 mL of *System suitability solution A* and 80 mL of *Mobile phase*, and shake by mechanical means for 10 min. Dilute with *Mobile phase* to volume.

Standard solution: 1 mg/mL of USP Leflunomide RS in a minimum volume of acetonitrile, and diluted with *Mobile phase*.

Sample solution: Transfer equivalent to 100 mg of leflunomide, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask. Add 20 mL of acetonitrile, dilute with *Mobile phase* to volume, and shake by mechanical means for 10 min. Pass through a membrane filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.0-mm × 12.5-cm; packing L1

Flow rate: 1 mL/min

Injection size: 10 µL

System suitability

Samples: *System suitability solution B* and *Standard solution*

[NOTE—The relative retention times for leflunomide related compound B, leflunomide related compound A, leflunomide related compound C, and leflunomide are 0.2, 0.4, 0.9, and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between leflunomide related compound C and leflunomide, *System suitability solution B*

Tailing factor: NMT 3.0 for leflunomide, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of leflunomide ($C_{12}H_9F_3N_2O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Leflunomide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of leflunomide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)****Test 1****Medium**

For Tablets labeled to contain 10 or 20 mg: Water, 1000 mL, deaerated

For Tablets labeled to contain 100 mg: Water containing 0.6% of polyoxyethylene (23) lauryl ether; 1000 mL, deaerated

Apparatus 2: 100 rpm

Time: 30 min

Determine the amount of leflunomide ($C_{12}H_9F_3N_2O_2$) dissolved by using one of the following methods.

Spectrometric method

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 262 nm

Standard solution: USP Leflunomide RS in *Medium*.

[NOTE—A volume of methanol not exceeding 2% of the final volume of the *Standard solution* may be used to dissolve leflunomide.]

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size.

Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*, if necessary.

Chromatographic method

Mobile phase: Acetonitrile and water (1:1)

Standard solution: Transfer 22 mg of USP Leflunomide RS to a 100-mL volumetric flask. Add 40 mL of acetonitrile, and sonicate until dissolved. Add 40 mL of water, and cool to room temperature. Dilute with water to volume. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, and dilute with water to volume.

Sample solution: Use portions of the solution under test passed through a suitable filter of 0.45-µm pore size.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 260 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 40 μL

System suitabilitySample: *Standard solution***Suitability requirements**

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the amount of leflunomide (C₁₂H₉F₃N₂O₂) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Leflunomide RS in the *Standard solution* (mg/mL) L = label claim (mg/Tablet) V = volume of *Medium*, 1000 mL**Tolerances:** NLT 80% (Q) of the labeled amount of leflunomide (C₁₂H₉F₃N₂O₂) is dissolved.**Test 2:** If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 2.**Medium, Apparatus 2, Time, Spectrometric method, and Chromatographic method:** Proceed as directed for Test 1.**Tolerances:** NLT 75% (Q) of the labeled amount of leflunomide (C₁₂H₉F₃N₂O₂) is dissolved.

- UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

Procedure for content uniformity

Mobile phase, System suitability solution A, System suitability solution B, Standard solution, Chromatographic system, and Analysis: Proceed as directed in the Assay.

Sample solution: Transfer 1 Tablet to a suitable volumetric flask, and prepare a solution having a concentration of 1 mg/mL of leflunomide. Add *Mobile phase* 50% by volume, and shake to disintegrate the Tablet. After the Tablet is completely disintegrated, add acetonitrile 20% by volume, dilute with *Mobile phase* to volume, and shake again. Pass through a membrane filter.**IMPURITIES**

- PROCEDURE**

Mobile phase, System suitability solution A, System suitability solution B, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

AnalysisSamples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 r_U = peak response of each individual impurity from the *Sample solution* r_T = sum of all the peak responses of the related compounds and leflunomide from the *Sample solution***Acceptance criteria**

Leflunomide related compound A: NMT 0.1%

Leflunomide related compound B: NMT 3.5%

Leflunomide related compound C: NMT 0.2%

Individual impurities: NMT 0.2%

Total impurities: NMT 4.0%

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant, and humidity-resistant containers.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if Test 1 is not used.
- USP REFERENCE STANDARDS (11)**

Solution A: Water

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	70	30
25	30	70

Diluent: Prepare as directed in the Assay.

System suitability solution: 10 µg/mL of USP Letrozole RS and 2 µg/mL of USP Letrozole Related Compound A RS in *Diluent*. [NOTE—Dissolve letrozole and letrozole related compound A in acetonitrile, then dilute with water.]

Standard solution: 1 µg/mL of USP Letrozole RS in *Diluent*. [NOTE—Dissolve letrozole in acetonitrile, then dilute with water.]

Sample solution: Nominally 0.1 mg/mL of letrozole in *Diluent*. Shake the whole Tablets (NLT 10) for about 15 min in a portion of *Diluent* to aid in dissolution. Centrifuge, and use the supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 12.5-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between letrozole and letrozole related compound A, *System suitability solution*

Relative standard deviation: NMT 10.0% for letrozole, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of letrozole from the *Standard solution*

C_S = concentration of USP Letrozole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of letrozole in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard any impurity peaks less than 0.05%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Letrozole related compound A ^a	0.67	—
Letrozole	1.0	—
4,4',4''-Methanetriyltribenzonitrile	2.4	—
Any unspecified impurity	—	0.1
Total unspecified impurities	—	0.3

^a 4,4'-(1*H*-1,3,4-Triazol-1-ylmethylene)dibenzonitrile.

[NOTE—Letrozole related compound A and 4,4',4''-Methanetriyltribenzonitrile are process impurities and are controlled in the drug substance monograph.]

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

C₁₇H₁₁N₅ 285.31

Leucine

C₆H₁₃NO₂

L-Leucine [61-90-5].

131.17

DEFINITION

Leucine contains NLT 98.5% and NMT 101.5% of L-leucine (C₆H₁₃NO₂), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

ASSAY

• PROCEDURE

Sample: 130 mg of Leucine

Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid. Titrate with the *Titrant*. Perform the blank determination.

Calculate the percentage of leucine (C₆H₁₃NO₂) in the portion of the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 131.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.4%

• **CHLORIDE AND SULFATE, Chloride** (221)

Standard solution: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.73 g of Leucine

Acceptance criteria: NMT 0.05%

• **CHLORIDE AND SULFATE, Sulfate** (221)

Standard solution: 0.10 mL of 0.020 N sulfuric acid

Sample: 0.33 g of Leucine

Acceptance criteria: NMT 0.03%

• **IRON** (241): NMT 30 ppm

Delete the following:

• **HEAVY METALS, Method II** (231): NMT 15 ppm • (Official 1-

USP Leucovorin Calcium RS

Leucovorin Calcium Injection**DEFINITION**

Leucovorin Calcium Injection is a sterile solution of leucovorin calcium ($C_{20}H_{21}CaN_7O_7$) in Water for Injection. It contains NLT 90.0% and NMT 120.0% of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Analysis: Transfer a volume of Injection, equivalent to 6 mg of leucovorin calcium, to a glass-stoppered, 50-mL centrifuge tube. Add 40 mL of acetone, mix, centrifuge for a few min, and decant and discard the liquid phase. Repeat the washing process with an additional 40 mL of acetone. Dry the precipitate so obtained with a stream of dry nitrogen.

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Use only freshly deionized water wherever water is specified throughout this *Procedure*. Use low-actinic glassware for solutions containing leucovorin calcium, and otherwise protect the solutions from unnecessary exposure to light. Complete the assay without prolonged interruption.

Solution A: 250 mg/mL of tetrabutylammonium hydroxide in methanol

Solution B: 276 mg/mL of monobasic sodium phosphate monohydrate in water

Mobile phase: Mix 15 mL of *Solution A* with 835 mL of water. Add 125 mL of acetonitrile, adjust with *Solution B* to an apparent pH of 7.5 ± 0.1 , dilute with water to 1000 mL, and filter. Adjust the concentration of acetonitrile, if necessary.

Diluent: Mix 15 mL of *Solution A* with 900 mL of water, and adjust with *Solution B* to a pH of 7.5 ± 0.1 . Dilute with water to 1000 mL.

Standard solution: 0.175 mg/mL of USP Leucovorin Calcium RS in *Diluent*

Sample solution: Transfer a measured volume of Injection, equivalent to 9 mg of leucovorin, to a 50-mL volumetric flask, and dilute with *Diluent* to volume. Pipet 25 mL of this solution into a 60-mL separator, add 25 mL of methylene chloride, shake the mixture, allow the layers to separate, and discard the methylene chloride extract. Repeat the extraction with two more 25-mL portions of methylene chloride, discarding the methylene chloride extracts. Filter the aqueous layer, discarding the first 5 mL of the filtrate, and collect the remaining filtrate in a glass-stoppered conical flask.

System suitability stock solution: 0.175 mg/mL of folic acid in *Diluent*

System suitability solution: *System suitability stock solution* and *Standard solution* (1:4)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 1–2 mL/min

Injection volume: 15 μ L

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for leucovorin and folic acid are 1.0 and about 1.6, respectively.]

Suitability requirements

Resolution: NLT 3.6 between leucovorin calcium and folic acid

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Leucovorin Calcium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of leucovorin in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of leucovorin, 473.45

M_{r2} = molecular weight of leucovorin calcium, 511.50

Acceptance criteria: 90.0%–120.0%

SPECIFIC TESTS

- **pH (791):** 6.5–8.5

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 1.95 USP Endotoxin Units/mg of leucovorin calcium

- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose, light-resistant containers, preferably of Type I glass.

• **USP REFERENCE STANDARDS (11)**

- USP Endotoxin RS
- USP Leucovorin Calcium RS

Leucovorin Calcium Tablets

DEFINITION

Leucovorin Calcium Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$).

IDENTIFICATION

- A.** **Sample:** Equivalent to 200 mg of leucovorin calcium from finely powdered Tablets
Analysis: Transfer the *Sample* to a conical flask. Add 10 mL of water, shake vigorously, sonicate for 10 min, and filter. Transfer the filtrate to a stoppered centrifuge tube, add 125 mg of ammonium oxalate, shake vigorously, and centrifuge until a clear supernatant is obtained. Transfer the supernatant to another stoppered centrifuge tube, add 1 mL of methanol and 3 drops of hydrochloric acid, and shake vigorously. If the preparation is cloudy, add methanol until a clear solution is obtained, and filter if necessary to remove any undissolved material. Cool the preparation at 0° until a precipitate forms, and centrifuge for 1–2 min. [NOTE—The cooling and centrifuging steps may be repeated if necessary to increase the amount of precipitate collected.] Decant the supernatant, add 2 mL of methanol to the tube, shake vigorously to dissolve the precipitate, and transfer the contents to a beaker. Evaporate under a current of air to dryness, and dry the residue at 50° for 30 min.
Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Leucovorin Calcium RS.
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Diluent: Methanol and water (20:80)

Mobile phase: 5 mM tetrabutylammonium phosphate in *Diluent*. Adjust with 50% (w/v) sodium hydroxide to a pH of 7.5.

Standard solution: 0.5 mg/mL of USP Leucovorin Calcium RS and 10 µg/mL of USP 10-Formylfolic Acid RS in water

Sample solution: Transfer finely powdered Tablets (NLT 20), equivalent to 50 mg of leucovorin, to a 100-mL volumetric flask. Add 50 mL of water, sonicate for 30 min, dilute with water to volume, mix, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 2.0 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for leucovorin and 10-formylfolic acid are about 1.0 and 2.3, respectively.]

Suitability requirements

Resolution: NLT 1.5 between leucovorin and 10-formylfolic acid

Relative standard deviation: NMT 2.0% for leucovorin

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak area of the *Sample solution*
- r_S = peak area of the *Standard solution*
- C_S = concentration of USP Leucovorin Calcium RS in the *Standard solution* (mg/mL)
- C_U = nominal concentration of leucovorin in the *Sample solution* (mg/mL)
- M_{r1} = molecular weight of leucovorin, 473.45
- M_{r2} = molecular weight of leucovorin calcium, 511.50

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Detector: UV, at a maximum of about 284 nm

Standard solution: USP Leucovorin Calcium RS in *Medium*

Sample solution: Use filtered portion of solution under test, and dilute with water if necessary to a concentration similar to that of the *Standard solution*.

Calculate the percentage of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (M_{r1}/M_{r2}) \times (1/L) \times 100$$

- A_U = absorbance of the *Sample solution*
- A_S = absorbance of the *Standard solution*
- C_S = concentration of the *Standard solution* (mg/mL)
- V = volume of *Medium*, 900 mL
- D = dilution factor
- M_{r1} = molecular weight of leucovorin, 473.45
- M_{r2} = molecular weight of leucovorin calcium, 511.50
- L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Analysis for content uniformity

Standard solution: 10 µg/mL of USP Leucovorin Calcium RS

Sample solution: 10 µg/mL of leucovorin calcium, use individual intact Tablets.

Blank: Water

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Cell: 1 cm

Analytical wavelength: UV, at maxima about 284 nm

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of leucovorin ($C_{20}H_{23}N_7O_7$) in each Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- A_U = absorbance of the *Sample solution*
- A_S = absorbance of the *Standard solution*
- C_S = concentration of USP Leucovorin Calcium RS in the *Standard solution* (µg/mL)
- C_U = nominal concentration of leucovorin in the *Sample solution* (µg/mL)
- M_{r1} = molecular weight of leucovorin, 473.45
- M_{r2} = molecular weight of leucovorin calcium, 511.50

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Diluent, Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = response of each impurity peak

r_T = sum of the responses of all the peaks

Acceptance criteria

Individual impurities: NMT 2.5%

Total impurities: NMT 4.0 %

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light, at controlled room temperature.

USP 10-Formylfolic Acid RS

USP Leucovorin Calcium RS

Leuprolide Acetate

$C_{59}H_{84}N_{16}O_{12} \cdot (C_2H_4O_2)_n$, $n = 1$ or 2 1209.41 (as free base)
Luteinizing hormone-releasing factor, 6-D-leucine-9-(N-ethyl-L-prolinamide)-10-deglycinamide acetate (salt);
5-Oxo-L-prolyl-L-histidyl-L-tryptophyl-L-seryl-L-tyrosyl-D-leucyl-L-leucyl-L-arginyl-N-ethyl-L-prolinamide acetate (salt)
[74381-53-6].

DEFINITION

Leuprolide Acetate is a synthetic nonapeptide agonist analog of luteinizing hormone-releasing factor. It contains NLT 97.0% and NMT 103.0% of leuprolide ($C_{59}H_{84}N_{16}O_{12}$), calculated on the anhydrous, acetic acid-free basis.

[NOTE—Due to the hygroscopic nature of this material, analyses are performed immediately after opening the container in a glove box under dry nitrogen purge.]

[CAUTION—Leuprolide Acetate is a potent hormonal manipulator. Avoid skin contact and inhalation of dusts and mists.]

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 15.2 mg/mL of triethylamine in water. Adjust with phosphoric acid to a pH of 3.0.

Solution B: Acetonitrile and *n*-propyl alcohol (3:2)

Mobile phase: *Solution A* and *Solution B* (17:3)

Standard stock solution: 1 mg/mL of USP Leuprolide Acetate RS in *Mobile phase*

Standard solution: 50 µg/mL. Dilute 5.0 mL of the *Standard stock solution* with *Mobile phase* to 100.0 mL.

Degradation standard solution: Dilute 5.0 mL of the *Standard stock solution* with water to 50.0 mL. Transfer 5 mL of the solution to a scintillation vial. Add 100 µL of 1 N sodium hydroxide solution, cap tightly, and shake vigorously. Place in an oven at 100° for 60 min. Remove, allow to cool, add 50 µL of 1 M phosphoric acid, recap, and shake vigorously to mix.

Sample solution: 50 µg/mL of Leuprolide Acetate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 3-µm packing L1

Flow rate: 1–1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *Mobile phase*, *Standard solution*, and *Degradation standard solution*

[NOTE—Chromatograph the *Mobile phase*, and verify that no extraneous peaks are present.]

[NOTE—The relative retention times for the degradation product and leuprolide are about 0.90 and 1.0, respectively.]

Suitability requirements

Retention time: 41–49 min for leuprolide, *Degradation standard solution*

Resolution: NLT 1.5 between leuprolide and the degradation product, *Degradation standard solution*

Tailing factor: 0.8–1.5, *Standard solution*

Relative standard deviation: NMT 1.5% for leuprolide acetate, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of leuprolide ($C_{59}H_{84}N_{16}O_{12}$) in the portion of Leuprolide Acetate taken:

$$\text{Result} = [(r_U/r_S) \times (C_S/C_U) \times P \times M \times 100]/(100 - AC - WC)$$

r_U = peak area of the *Sample solution*

r_S = peak area of the *Standard solution*

C_S = concentration of USP Leuprolide Acetate RS in the *Standard solution* (µg/mL)

C_U = concentration of Leuprolide Acetate in the *Sample solution* (µg/mL)

P = designated purity of USP Leuprolide Acetate RS (%)

M = $(100 - H)/100$, where H is equal to the water content of USP Leuprolide Acetate RS

AC = acetic acid content (%)

WC = water content (%)

Acceptance criteria: 97.0%–103.0% on the anhydrous and acetic acid-free basis

OTHER COMPONENTS

• CONTENT OF ACETIC ACID

Diluent: Methanol, adjusted with phosphoric acid to a pH of 2.5

Standard solution: Pipet 2.0 mL of glacial acetic acid into a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 4.0 mL of the solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

to obtain a solution having a known concentration of about 0.08 mg/mL.

Sample solution: Transfer about 100 mg of Leuprolide Acetate, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused-silica capillary column that contains a 1.2-μm film of phase G35

Temperature

Column: 100°

Injection port: 200°

Detector: 250°

Carrier gas: Helium

Flow rate: 10 mL/min

Injection size: 1.0 μL

Injection type: Splitless mode

System suitability

Samples: *Diluent* and *Standard solution*

Suitability requirements

Blank: Chromatograph the *Diluent*, and verify that there are no interfering peaks.

Column efficiency: NLT 15,000 theoretical plates, *Standard solution*

Tailing factor: 0.8–1.5, *Standard solution*

Relative standard deviation: NMT 2.0% for glacial acetic acid, for replicate injections of the *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acetic acid (C₂H₄O₂) in the portion of Leuprolide Acetate taken:

$$\text{Result} = (r_U/r_S) \times (839.2/W_U)$$

r_U = peak area of the *Sample solution*

r_S = peak area of the *Standard solution*

W_U = weight of Leuprolide Acetate taken to prepare the *Sample solution* (mg)

Acceptance criteria: 4.7%–9.0%

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

• CHROMATOGRAPHIC PURITY

Solution A: 15.2 mg/mL of triethylamine in water. Adjust with phosphoric acid to a pH of 3.0 before final dilution.

Solution B: Acetonitrile and *n*-propyl alcohol (3:2)

Mobile phase: *Solution A* and *Solution B* (17:3)

Standard stock solution: 1 mg/mL of USP Leuprolide Acetate RS in *Mobile phase*

Standard solution: Dilute 1.0 mL of the *Standard stock solution* with *Mobile phase* to 100.0 mL.

Degradation standard solution: Dilute 5 mL of *Standard stock solution* with water to 50.0 mL. Transfer 5 mL of the solution to a scintillation vial. Add 100 μL of 1 N sodium hydroxide solution, tightly cap, and shake vigorously. Place in an oven at 100° for 60 min. Remove, allow to cool, add 50 μL of 1 M phosphoric acid, recap, and shake vigorously to mix.

Sample solution: Transfer about 100 mg of Leuprolide Acetate to a 100-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 3-μm packing L1

Flow rate: 1–1.5 mL/min

Injection size: 20 μL

System suitability

Samples: *Mobile phase*, *Standard solution*, *Degradation standard solution*, and *Sample solution*

[NOTE—Chromatograph the *Mobile phase*, and verify that no extraneous peaks are present.]

Suitability requirements

Retention time: 41–49 min for leuprolide, *Degradation standard solution*

Resolution: NLT 1.5 between leuprolide and the degradation product, *Degradation standard solution*

Tailing factor: 0.8–1.5, *Standard solution*

Relative standard deviation: NMT 1.5% for leuprolide acetate, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Record the chromatograms for 90 min.]

Calculate the percentage of each impurity in the portion of leuprolide acetate [C₅₉H₈₄N₁₆O₁₂ · (C₂H₄O₂)_n] taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times M$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of leuprolide from the *Standard solution*

C_S = concentration of USP Leuprolide Acetate RS in the *Standard solution* (mg/mL)

C_U = concentration of Leuprolide Acetate in the *Sample solution* (mg/mL)

P = designated purity of USP Leuprolide Acetate RS (%)

M = (100 – H)/100, where H is equal to the water content of USP Leuprolide Acetate RS

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Acetyl-leuprolide	1.5	1.0
D-His-leuprolide	0.9	0.5
L-Leu ⁶ -leuprolide	1.2	0.5
D-Ser-leuprolide	0.8	0.5
Leuprolide	1.0	—
Any other impurity	—	0.5
Total impurities	—	2.5

SPECIFIC TESTS

• AMINO ACID CONTENT

[NOTE—Use a suitable, validated procedure (see *Biotechnology-Derived Articles—Amino Acid Analysis* (1052)).]

Standard solutions: Prepare a solution having known equimolar amounts of L-alanine, L-arginine, L-aspartic acid, L-glutamic acid, glycine, L-histidine, L-isoleucine, L-leucine, L-lysine, L-methionine, L-phenylalanine, L-proline, L-serine, L-threonine, L-tyrosine, and L-valine with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as norleucine, is used. Prepare a separate, equimolar solution of L-tryptophan.

Sample solution: Transfer 64 mg of Leuprolide Acetate to a suitable vessel. Dissolve in 1.0 mL of water. Transfer 0.10 mL of this solution to a vacuum hydrolysis tube. Add 2.0 mL of 6 N hydrochloric acid, evacuate the tube, and heat for 16 h at 120°. Transfer 0.10 mL of the hydrolysate so obtained to a suitable vessel, add 1 mL of water, and lyophilize. Dissolve in and dilute to a suitable volume in a buffer solution suitable for amino acid analysis.

Analysis: Inject equal volumes of the *Standard solution* and *Sample solution* into the amino acid analyzer, and record and measure the responses for each amino acid peak. Express the content of each amino acid in moles.

Calculate the relative proportions of the amino acids in the *Sample solution*, taking one-seventh of the sum of the number of moles of histidine, glutamic acid, leucine, proline, tyrosine, and arginine as equal to one.

Acceptance criteria: 0.85–1.1 moles each of glutamic acid, proline, tyrosine, histidine, and arginine per mole of Leuprolide Acetate; 1.8–2.2 moles of leucine per mole of Leuprolide Acetate; serine and tryptophan are also present.

• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 10 mg/mL, in 1% acetic acid

Acceptance criteria: -38.0° to -42.0° expressed on an anhydrous, acetic acid-free basis

• **WATER DETERMINATION, Method 1c (921):** NMT 8.0%

• **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 166.7 USP Endotoxin Units/mg of leuprolide acetate.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

Store at a temperature not higher than 30° .

• **USP REFERENCE STANDARDS (11)**

USP Endotoxin RS

USP Leuprolide Acetate RS

Levalbuterol Inhalation Solution

DEFINITION

Levalbuterol Inhalation Solution is a sterile, aqueous solution of Levalbuterol Hydrochloride, prepared with Sodium Chloride. It contains NLT 90.0% and NMT 110.0% of the labeled amount of levalbuterol ($C_{13}H_{21}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Solution A: Phosphoric acid in water (1 in 1000)

Solution B: Acetonitrile, methanol, water, and phosphoric acid (350:350:300:1)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	91.5	8.5
15	91.5	8.5
15.01	0	100
20	0	100
20.01	91.5	8.5
30	91.5	8.5

Diluent: Dissolve 9.0 g of sodium chloride in 950 mL of water. Adjust with dilute sulfuric acid to a pH of 4.0, and dilute with water to 1000 mL. Mix, and pass through a filter of 0.45- μ m pore size.

Standard solution: 0.1 mg/mL of USP Levalbuterol Hydrochloride RS in *Diluent*

Sample solution: Nominally 0.1 mg/mL of levalbuterol hydrochloride (equivalent to 0.087 mg/mL of levalbuterol free base) in *Diluent* from an appropriately diluted volume of Inhalation Solution

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 5500 theoretical plates

Tailing factor: NMT 2.3

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levalbuterol ($C_{13}H_{21}NO_3$) in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of levalbuterol hydrochloride from the *Sample solution*

r_S = peak response of levalbuterol hydrochloride from the *Standard solution*

C_S = concentration of USP Levalbuterol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levalbuterol in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of levalbuterol (free base), 239.31

M_{r2} = molecular weight of levalbuterol hydrochloride, 275.77

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Solution B, Diluent, and Sample solution: Prepare as directed in the *Assay*.

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	70	30
50	28	72
50.01	0	100
55	0	100
55.01	100	0
70	100	0

System suitability solution: Prepare a solution containing the following in *Diluent*.

USP Levalbuterol Hydrochloride RS, 100 μ g/mL

USP Levalbuterol Related Compound A RS, 0.05 μ g/mL

USP Levalbuterol Related Compound B RS, 0.05 μ g/mL

USP Levalbuterol Related Compound C RS, 0.05 μ g/mL

USP Levalbuterol Related Compound D RS, 0.05 μ g/mL

USP Levalbuterol Related Compound E RS, 0.05 µg/mL
USP Levalbuterol Related Compound F RS, 0.05 µg/mL

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Column temperature: 45°

Flow rate: 1 mL/min

Injection volume: 50 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 4.9 between levalbuterol and levalbuterol related compound A; NLT 1.5 between levalbuterol related compound B and levalbuterol related compound C

Tailing factor: NMT 4.0 for the levalbuterol peak

Analysis

Sample: *Sample solution*

[NOTE—Integrate all peaks with an area greater than 0.05% of the area corresponding to the levalbuterol peak.]

Calculate the percentage of each impurity in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the responses of all the peaks

F = relative response factor for each impurity (see Table 3)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
5-Hydroxyalbuterol ^a	0.90	1.0	0.10

^b Process impurity, included for identification purposes only. Not to be included in the Total impurities.

^c 4-[2-(*tert*-Butylamino)-1-methoxyethyl]-2-(hydroxymethyl)phenol.

• ENANTIOMERIC PURITY

Mobile phase: Acetonitrile, methanol, acetic acid, and triethylamine (500:500:3:1)

Diluent: *Mobile phase*

System suitability solution: 0.10 mg/mL of USP Levalbuterol Hydrochloride RS and 0.04 mg/mL of USP Albuterol RS in *Diluent*

Sample solution: Inhalation Solution

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; 5-µm packing L63

Flow rate: 1 mL/min

Injection volume: 10 µL of the *System suitability solution* and a suitable volume of *Sample solution* to obtain 4.2 µg of levalbuterol injected on the column

Run time: NLT 30 min

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times of levalbuterol and (S)-albuterol are 1.0 and 1.16, respectively.]

Suitability requirements

Resolution: NLT 3.0 between levalbuterol and (S)-albuterol

Tailing factor: NMT 1.6 for levalbuterol and NMT 2.0 for (S)-albuterol

Relative standard deviation: NMT 20% for (S)-albuterol, for three injections

Analysis

Sample: *Sample solution*

Calculate the percentage of (S)-albuterol in the portion of Inhalation Solution taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of (S)-albuterol

r_T = sum of the peak responses of levalbuterol and (S)-albuterol

Acceptance criteria: NMT 2.50% of (S)-albuterol in the *Sample solution*

SPECIFIC TESTS

• **STERILITY TESTS** <71>: Meets the requirements

• **pH** <791>: 3.3–4.5

• **PARTICULATE MATTER IN INJECTIONS** <788>: See Table 4.

Table 4

Particle Size (µm)	Limit NMT (particles/container)
≥10	250
≥25	25
≥100	2
≥300	1

• **OSMOLALITY AND OSMOLARITY**, *Osmolality* <785>: 280–320 mOsmol/kg

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE**: Preserve in low-density polyethylene single-use ampuls, with a multilayer foil overwrap. Store at controlled room temperature.

• **LABELING**: The outer label indicates the dose and that the ampuls should be discarded if the solution is not colorless.

• USP REFERENCE STANDARDS (11)

Levamisole Hydrochloride

$C_{11}H_{12}N_2S \cdot HCl$ 240.75

Imidazo[2,1-*b*]thiazole, 2,3,5,6-tetrahydro-6-phenyl-, monohydrochloride, (5*S*)-.

(-)-2,3,5,6-Tetrahydro-6-phenylimidazo[2,1-*b*]thiazole monohydrochloride [16595-80-5].

» Levamisole Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of $C_{11}H_{12}N_2S \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers, protected from light.

USP Reference standards (11)—

USP Levamisole Hydrochloride RS

Completeness of solution (641)—A test solution of 500 mg of Levamisole Hydrochloride dissolved in 10 mL of water meets the requirements.

Color of solution—The test solution prepared for the test for *Completeness of solution* is colorless or not more intensely colored than a color matching fluid prepared by mixing 2.5 mL of *Matching Fluid F* (see *Color and Achromicity* (631)) with 97.5 mL of 0.12 N hydrochloric acid.

Identification—

A: The IR absorption spectrum of a potassium bromide dispersion of it, previously dried, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Levamisole Hydrochloride RS.

B: The color, size, and R_f value of the principal spot in the chromatogram of *Test solution B* obtained in the test for *Chromatographic purity*, when examined under short-wavelength UV light, correspond to the respective characteristics of the principal spot in the chromatogram of *Reference solution A* obtained in the test for *Chromatographic purity*.

C: A solution of it responds to the tests for *Chloride* (191).

Melting range (741): between 226° and 231°.

Light absorption—Its absorbance (see *Ultraviolet-Visible Spectroscopy* (857)) at 310 nm, determined in a 0.2 N methanolic hydrochloric acid solution containing 1 mg per mL using a 1-cm cell, is not more than 0.20.

Specific rotation (781S): between -121.5° and -128.0°.

Test solution: 50 mg per mL, in water.

pH (791): between 3.0 and 4.5, in a solution (1 in 20).

Loss on drying (731): Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method I** (231): 0.001%. • (Official 1-Jan-2018)

Chromatographic purity—Prepare a solution of it in methanol containing 50 mg per mL (*Test solution A*). Dilute 1.0 mL of *Test solution A* to 10 mL with methanol, and mix (*Test solution B*). Prepare a solution of USP Levamisole Hydrochloride RS in methanol having a concentration of 5 mg per mL (*Reference solution A*). Dilute 1.0 mL of *Test solution B* to 20 mL with methanol, and mix (*Reference solution B*). Apply separate 10-μL portions of the four solutions on the starting line to a suitable thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of

chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, acetone, and ammonium hydroxide (60:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and dry it at 105° for 15 minutes. Locate the spots on the plate by examination under short-wavelength UV light: any spot obtained from *Test solution A*, other than the one corresponding to levamisole, does not exceed, in size or intensity, the principal spot obtained from *Reference solution B*, corresponding to not more than 0.5% of any individual impurity. Expose the plate to iodine vapor in a closed chamber for 15 minutes, and locate the spots on the plate: any spot obtained from *Test solution A*, other than the one corresponding to levamisole, does not exceed, in size or intensity, the principal spot obtained from *Reference solution B*, corresponding to not more than 0.5% of any individual impurity, and the total of all impurities found does not exceed 1.0%.

Assay—Dissolve about 200 mg of Levamisole Hydrochloride, accurately weighed, in 30 mL of alcohol. Add 5.0 mL of 0.01 N hydrochloric acid, and titrate with 0.1 N sodium hydroxide VS, determining the two inflection points potentiometrically. Determine the volume, in mL, of 0.1 N sodium hydroxide consumed between the two inflection points. Each mL of 0.1 N sodium hydroxide consumed is equivalent to 24.08 mg of $C_{11}H_{12}N_2S \cdot HCl$.

Levamisole Hydrochloride Tablets

» Levamisole Hydrochloride Tablets contain an amount of Levamisole Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of levamisole ($C_{11}H_{12}N_2S$).

Packaging and storage—Preserve in well-closed containers.

Labeling—Label it to state both the content of the active moiety and the content of the salt used in formulating the article.

USP Reference standards (11)—

USP Levamisole Hydrochloride RS

Identification—

A: The retention time of the major peak for levamisole in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: The R_f value of the principal spot obtained from *Test solution B* in the *Chromatographic purity* test corresponds to that from *Standard solution A*.

Dissolution (711)—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of levamisole ($C_{11}H_{12}N_2S$) dissolved by employing UV absorption at the wavelength of maximum absorbance at about 214 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Levamisole Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{11}H_{12}N_2S$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Chromatographic purity—

Test solution A—Transfer an amount of powdered Tablets, equivalent to 100 mg of levamisole, to a glass test tube. Add 5.0 mL of methanol, shake for 2 minutes, and filter.

Test solution B—Dilute 1.0 mL of *Test solution A* to 10 mL with methanol, and mix.

Standard solution A—Prepare a solution of USP Levamisole Hydrochloride RS in methanol having a concentration of 2.4 mg per mL (equivalent to 2.0 mg of levamisole per mL).

Standard solution B—Dilute 1.0 mL of *Standard solution A* to 20 mL with methanol, and mix.

Procedure—Apply separate 10-μL portions of *Test solutions A* and *B* and *Standard solutions A* and *B* to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of toluene, acetone, and ammonium hydroxide (60:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and dry the plate at 105° for 15 minutes. Locate the spots on the plate by examination under short-wavelength UV light: any spot obtained from *Test solution A*, other than that of levamisole, does not exceed, in size or intensity, the principal spot obtained from *Standard solution B*, corresponding to not more than 0.5% of any individual impurity. Expose the plate to iodine vapor in a closed chamber for 15 minutes, and locate the spots on the plate: any spot obtained from *Test solution A*, other than that of levamisole, does not exceed, in size or intensity, the principal spot obtained from *Standard solution B*, corresponding to not more than 0.5% of any individual impurity.

Assay—

Solution A—Prepare a 0.75% solution of monobasic ammonium phosphate in water, and adjust with diisopropylamine to a pH of 7.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 20 mg of USP Levamisole Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add 10 mL of water, and swirl to dissolve. Dilute with methanol to volume, and mix to obtain a solution having a known concentration of about 0.2 mg of USP Levamisole Hydrochloride RS per mL.

Resolution solution—Dissolve 20 mg of Levamisole Hydrochloride in 5 mL of 0.1 N sodium hydroxide, and heat at 100° in a closed vial for 5 hours. Allow to cool, and dilute 1 mL of the solution to 25 mL with methanol.

Assay preparation—Transfer an accurately counted number of Tablets, equivalent to about 150 mg of levamisole (C₁₁H₁₂N₂S), to a 100-mL volumetric flask. Add 25 mL of water, and shake by mechanical means for 30 minutes. Dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with methanol to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 10-cm column that contains 3-μm packing L1. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–5	80→20	20→80	linear gradient
5–7	20	80	isocratic
7–8	20→80	80→20	linear gradient
8–12	80	20	isocratic

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for levamisole and about 1.3 for the major degradation product; and the resolution, *R*, between levamisole and the major degradation product is not less than 6.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, is not less than 3.0; the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of levamisole (C₁₁H₁₂N₂S) in the Tablets taken by the formula:

$$(204.29 / 240.75)(1000C)(r_U / r_S)$$

in which 204.29 and 240.75 are the molecular weights of levamisole and levamisole hydrochloride, respectively; *C* is the concentration, in mg per mL, of USP Levamisole Hydrochloride RS in the *Standard preparation*; and *r_U* and *r_S* are the levamisole peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Levetiracetam

C₈H₁₄N₂O₂ 170.21
1-Pyrrolidineacetamide, α-ethyl-2-oxo-, (αS)-;
(-)-(S)-α-Ethyl-2-oxo-1-pyrrolidineacetamide [102767-28-2].

DEFINITION

Levetiracetam contains NLT 98.0% and NMT 102.0% of levetiracetam (C₈H₁₄N₂O₂), calculated on the anhydrous and solvent-free basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (197K)**
- B.** The retention time of the major peak of the *Identification solution* corresponds to that of the levetiracetam *S*-enantiomer from the *System suitability solution*, as obtained in the test for *Limit of Levetiracetam R-Enantiomer*.

ASSAY**PROCEDURE**

Buffer: 2.7 g/L of monobasic potassium phosphate in water. Adjust with 2% aqueous potassium hydroxide (w/v) to a pH of 5.5.

Solution A: Acetonitrile and *Buffer* (1:19)

Solution B: Acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
3	100	0
20	71	29

System suitability solution: 0.2 mg/mL of USP Levetiracetam RS and 0.08 mg/mL of USP Levetiracetam Related Compound A RS in *Solution A*. Prepare by first dissolving the required amount of USP Levetiracetam RS in a suitable volumetric flask. Add 10% of the flask vol-

ume of 0.1 N potassium hydroxide. Let the mixture react at room temperature for about 15 min, and then neutralize by adding 0.1 N hydrochloric acid at 10% of the flask volume. Add the required amount of USP Levetiracetam Related Compound A RS, sonicate to dissolve, dilute with *Solution A* to volume, and mix.

[NOTE—Levetiracetam related compound A is included for peak identification purposes.]

Standard solution: 0.1 mg/mL of USP Levetiracetam RS in *Solution A*

Sample solution: 0.1 mg/mL of Levetiracetam in *Solution A*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 4.6-mm × 15-cm; packing L1

Flow rate: 0.9 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 2* for relative retention times.]

Suitability requirements

Relative standard deviation: NMT 1.0%, for the levetiracetam peak

[NOTE—If system suitability criteria cannot be met, it is recommended that the column temperature be maintained at 20° to stabilize the system.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levetiracetam ($C_8H_{14}N_2O_2$) in the portion of Levetiracetam taken:

$$\text{Result} = [(r_U/r_S) \times (C_S/C_U) \times 100] - F$$

r_U = peak response of levetiracetam from the *Sample solution*

r_S = peak response of levetiracetam from the *Standard solution*

C_S = concentration of USP Levetiracetam RS in the *Standard solution* (mg/mL)

C_U = concentration of Levetiracetam in the *Sample solution* (mg/mL)

F = percentage of levetiracetam *R*-enantiomer from the test for *Limit of Levetiracetam R-Enantiomer*

Acceptance criteria: 98.0%–102.0% on the anhydrous and solvent-free basis

IMPURITIES

Levetiracetam Injection

DEFINITION

Levetiracetam Injection is a sterile solution of levetiracetam in Water for Injection and contains NLT 90.0% and NMT 110.0% of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$). Levetiracetam Injection may contain buffering and isotonicity agents. Levetiracetam Injection contains no antimicrobial agent.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 1.0 g/L of anhydrous dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 6.0.

Mobile phase: Acetonitrile and *Buffer* (6:94)

Diluent: Acetonitrile and water (6:94)

System suitability solution: Solution containing levetiracetam and levetiracetam acid prepared from a solution of 0.2 mg/mL of USP Levetiracetam RS as follows. Dissolve the required amount of USP Levetiracetam RS in 10% of the final volume of 0.1 N potassium hydroxide. Let the mixture react at room temperature for about 15 min, then neutralize by adding 10% of the flask volume of 0.1 N hydrochloric acid. Dilute with *Diluent* to volume.

Standard solution: 100 µg/mL of USP Levetiracetam RS in *Diluent*. Sonication may be used to aid in dissolution if necessary.

Sample solution: Nominally 100 µg/mL of levetiracetam from NLT 2 mL of Injection in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability solution: 0.2 mg/mL of USP Levetiracetam RS and 0.1 mg/mL of USP Levetiracetam Related Compound A RS in *Diluent* prepared as follows. Dissolve the required amount of USP Levetiracetam RS in 10% of the final volume of 0.1 N potassium hydroxide. Let the mixture react at room temperature for about 15 min, and then neutralize by adding 0.1 N hydrochloric acid at 10% of the flask volume. Add the required amount of USP Levetiracetam Related Compound A RS, sonicate to dissolve, and dilute with *Diluent* to volume. [NOTE—This solution contains levetiracetam, levetiracetam acid, and levetiracetam related compound A.]

Standard solution: 3 μg/mL of USP Levetiracetam RS in *Solution A*

Sample solution: Nominally 2 mg/mL of levetiracetam prepared as follows. Transfer a suitable volume of the Oral Solution to a suitable volumetric flask. Add 60% of the flask volume of *Solution A*, and sonicate at room temperature for 5 min with intermittent shaking. Allow the solution to cool, and dilute with *Solution A* to volume. Pass a portion of the solution through a suitable filter.

(S)-N-(1-Amino-1-oxobutan-2-yl)-4-chlorobutanamide.

C₈H₁₅ClN₂O₂ 206.67

Levetiracetam Tablets

DEFINITION

Levetiracetam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K), (197A)

Standard solution: 1 mg/mL solution of USP Levetiracetam RS in solution prepared as follows. Transfer a suitable quantity of USP Levetiracetam RS to a suitable volumetric flask. Add 70% of the flask volume of acetone. Sonicate for 15 min. Dilute with acetone to volume.

Standard: Pass 10 mL of the *Standard solution* through a membrane filter of 0.45- μ m pore size. Evaporate acetone from the filtrate completely to form crystals. Scratch the crystals. Weigh 2–4 mg of the residue and 200 mg of KBr in a mortar and pestle. Mix and grind well, and prepare the KBr pellet.

Sample solution: Transfer an amount of finely powdered Tablets (NLT 20) equivalent to 250 mg of levetiracetam to a 50-mL volumetric flask. Add 35 mL of acetone. Sonicate for 15 min. Dilute with acetone to volume.

Sample: Pass 10 mL of the *Sample solution* through a membrane filter of 0.45- μ m pore size. Evaporate acetone from the filtrate completely to form crystals. Scratch the crystals. Weigh 2–4 mg of the residue and 200 mg of KBr in a mortar and pestle. Mix and grind well, and prepare the KBr pellet.

Analysis: Record the spectra of the *Standard* and *Sample* between 4000 cm^{-1} and 650 cm^{-1} .

Acceptance criteria: The spectrum of the *Sample* corresponds to that of the *Standard*.

- **B.** The retention time of the major peak of the *Sample* solution corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 1.4 g/L of monobasic potassium phosphate and 0.6 g/L of sodium 1-heptanesulfonate, adjusted with phosphoric acid to a pH of 2.8

Mobile phase: Acetonitrile and *Buffer* (8:92)

Diluent: Acetonitrile and water (20:80)

Standard solution: 0.35 mg/mL of USP Levetiracetam RS in *Diluent*. Sonication may be used to aid dissolution.

Sample solution: Nominally 0.4 mg/mL of levetiracetam from NLT 20 Tablets, finely crushed, in *Diluent*. Sonication may be used to aid dissolution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; 4- μ m packing L1

Flow rate: 2 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levetiracetam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levetiracetam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: See *Table 1*.

Table 1

Tablet Strength (mg/Tablet)	Time (min)
250	15
500	15
750	15
1000	30

Buffer: 6.8 g/L of monobasic potassium phosphate, adjusted with dilute potassium hydroxide to a pH of 5.6

Mobile phase: Acetonitrile and *Buffer* (15:85)

Standard solution: ($L/1000$) mg/mL in *Medium*, where L is the Tablet label claim, in mg

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levetiracetam RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances

NLT 70% (Q) of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) in 15 min for Tablets labeled to contain 250, 500, or 750 mg; NLT 80% (Q) of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) in 30 min for Tablets labeled to contain 1000 mg.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 2.

Medium: Water; 900 mL, deaerate, if necessary

Apparatus 2: 50 rpm

Time: 15 min

Buffer: 1.36 g/L of monobasic potassium phosphate, adjusted with 10% potassium hydroxide to a pH of 5.0

Mobile phase: Acetonitrile and *Buffer* (10:90)

Standard solution: 54 μ g/mL of USP Levetiracetam RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute an aliquot with *Medium* to obtain a concentration similar to that of the *Standard solution*.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Levetiracetam Extended-Release Tablets**DEFINITION**Levetiracetam Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levetiracetam (C₈H₁₄N₂O₂).**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE****Buffer:** 1.4 g/L of anhydrous dibasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.**Mobile phase:** Acetonitrile and *Buffer* (10:90)**Standard stock solution:** 1.0 mg/mL of USP Levetiracetam RS prepared as follows. Weigh a suitable quantity of the Reference Standard into a volumetric

flask. Add *Mobile phase* to fill 60% of flask volume and tetrahydrofuran to fill 4% of flask volume. Sonicate in cool water to dissolve. Equilibrate to room temperature. Dilute with *Mobile phase* to volume.

Standard solution: 0.08 mg/mL of USP Levetiracetam RS in *Mobile phase* from *Standard stock solution*. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size.

Sample stock solution: Nominally ($L/100$) mg/mL of levetiracetam from NLT 5 Tablets prepared as follows, where L is the label claim in mg/Tablet. Transfer the Tablets to a volumetric flask containing tetrahydrofuran to fill about 5% of flask volume. Stir for 30 min, and allow to stand for 5 min. Sonicate for 20 min with intermittent shaking. Add *Mobile phase* to fill 80% of final volume, and sonicate in cold water for 20 min with intermittent shaking. Add methanol to fill 10% of flask volume. Dilute with *Mobile phase* to volume. Centrifuge for 15 min, and pass a portion of the solution through a suitable filter of 0.2- μ m pore size.

Alternatively, the *Sample stock solution*, having a nominal concentration of 3 mg/mL of levetiracetam, may be prepared as follows. Finely grind NLT 10 Tablets, and transfer an amount equivalent to 750 mg of levetiracetam to a suitable volumetric flask. Add 18% of the flask volume of acetonitrile. Sonicate for 10 min followed by shaking using a mechanical shaker for 10 min. Add 18% of the flask volume of water, and shake for 15 min using a mechanical shaker. Allow the sample to equilibrate to room temperature, and dilute with a mixture of acetonitrile and water (50:50) to volume. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size.

Sample solution: Nominally 0.08 mg/mL of levetiracetam in *Mobile phase* from *Sample stock solution*

		500 mg/ Tablet (%)	750 mg/ Tablet (%)
1	1	42–62	35–55
2	2	59–79	50–70
3	4	78–98	70–90
4	8	NLT 80	NLT 80

The percentages of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$), dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 4: If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 4*.

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 6.0.

Medium: *Buffer*, 900 mL

Apparatus 1: 100 rpm

Times: 1, 2, 4, and 8 h

Standard solution: (L/900) mg/mL of USP Levetiracetam RS in *Medium*, where L is the label claim in mg/Tablet

Sample solution: Pass a suitable portion of the solution under test through a suitable filter of 0.45- μ m pore size. Discard the first 3 mL of the filtrate. Dilute a known volume of the remaining filtrate quantitatively with *Medium*.

Blank: *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: 210 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration, C_i , of levetiracetam ($C_8H_{14}N_2O_2$) in *Medium* (mg/mL) after time point i :

$$\text{Result}_i = (A_U/A_S) \times C_S$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_S)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_3 \times V) + [(C_2 + C_1) \times V_S]] \times (1/L) \times 100$$

$$\text{Result}_4 = [(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_S]] \times (1/L) \times 100$$

C_i = concentration of levetiracetam in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_S = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See Table 4.

Table 4

Time Point (i)	Time (h)	Amount Dissolved	
		500 mg/ Tablet (%)	750 mg/ Tablet (%)
1	1	22–42	16–36
2	2	39–59	30–50
3	4	62–82	50–70
4	8	NLT 80	NLT 80

The percentages of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$), dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 5: If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: pH 6.0 phosphate buffer (6.8 g/L of monobasic potassium phosphate in water. Adjust with sodium hydroxide to a pH of 6.0.); 900 mL

Apparatus 1: 100 rpm

Times: 1, 4, 8, and 12 h

Buffer: 2.7 g/L of monobasic potassium phosphate in water

Mobile phase: Acetonitrile and *Buffer* (10:90)

Standard stock solution: 2.8 mg/mL of USP Levetiracetam RS in *Medium* prepared as follows. Transfer a suitable quantity of USP Levetiracetam RS to a suitable volumetric flask. Dissolve in 20% of the flask volume of methanol. Dilute with *Medium* to volume.

Standard solution: (L/900) mg/mL of USP Levetiracetam RS in *Medium* from *Standard stock solution*, where L is the label claim in mg/Tablet

Sample solution: At each time point withdraw 1 mL of the solution under test, and pass it through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L11

Flow rate: 1 mL/min

Injection volume: 10 μ L

Run time: 2 times the retention time of levetiracetam

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 4000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0% for five replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) in *Medium* (mg/mL) after time point *i*:

$$\text{Result}_i = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levetiracetam RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: See Table 5.

Table 5

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 40
2	4	55–80
3	8	NLT 75
4	12	NLT 85

The percentages of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$), dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 6: If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 6*.

Medium: pH 6.0 phosphate buffer (6.9 g of monobasic sodium phosphate, and 0.23 g of sodium hydroxide in 1 L of water. Adjust with sodium hydroxide or phosphoric acid to a pH of 6.0.); 900 mL

Apparatus 1: 100 rpm

Times: 1, 2, 4, and 8 h

Mobile phase: Acetonitrile and water (10:90)

Standard solution: 0.5 mg/mL of USP Levetiracetam RS in *Medium* prepared as follows. Transfer a suitable quantity of USP Levetiracetam RS to a suitable volumetric flask. Add 4% of the flask volume of methanol and 60% of the flask volume of the *Medium*. Sonicate for NLT 5 min. Dilute with *Medium* to volume.

Sample solution: At the end of specified time interval, withdraw a known volume of the solution from the dissolution vessel. Pass a suitable portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 5-cm; 5- μ m packing L1

Column temperature: 30°

Flow rate: 0.9 mL/min

Injection volume: 10 μ L

Run time: 2 times the retention time of levetiracetam

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the concentration, C_i , of levetiracetam ($C_8H_{14}N_2O_2$) in *Medium* (mg/mL) after time point *i*:

$$\text{Result}_i = (r_U/r_S) \times C_S$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) dissolved at each time point (*i*):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = \{[C_2 \times (V - V_3)] + (C_1 \times V_3)\} \times (1/L) \times 100$$

$$\text{Result}_3 = \{[C_3 \times [V - (2 \times V_3)]] + [(C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

$$\text{Result}_4 = \{[C_4 \times [V - (3 \times V_3)]] + [(C_3 + C_2 + C_1) \times V_3]\} \times (1/L) \times 100$$

C_i = concentration of levetiracetam in *Medium* in the portion of sample withdrawn at time point *i* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn from the solution under test (mL)

Tolerances: See Table 6.

Table 6

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	25–45
2	2	45–65
3	4	60–80
4	8	NLT 80

The percentages of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$), dissolved at the times specified, conform to *Dissolution* (711), *Acceptance Table 2*.

Test 7: If the product complies with this procedure, the labeling indicates that it meets USP *Dissolution Test 7*.

Medium: Acetate buffer, pH 4.5, prepared as follows. Dissolve 3.0 g of sodium acetate in 1 L of water and add 1.4 mL of glacial acetic acid. Adjust with 5 N sodium hydroxide or glacial acetic acid to a pH of 4.5; 230 mL

Apparatus 3: 15 dips per min, with suitable screens

For 500-mg Tablets: 1, 2, 4, and 8 h

For 750-mg Tablets: 1, 2, 4, and 10 h

Buffer: 13.6 g/L of monobasic potassium phosphate in water. Adjust with 5 N sodium hydroxide to a pH of 6.0.

Mobile phase: Methanol and Buffer (15:85)

Standard solution: 0.55 mg/mL of USP Levetiracetam RS in Buffer A. Sonication may be used to aid in dissolution.

Sample solution: Pass a suitable portion of the solution under test through a suitable filter of 0.45- μ m pore size. Discard the first 5 mL. Dilute a suitable volume of the filtrate with Medium, as needed.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 10-cm; 3- μ m packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 μ L

Run time: 2 times the retention time of levetiracetam

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the concentration, C_s , of levetiracetam ($C_8H_{14}N_2O_2$) in Medium (mg/mL) after time point i :

$$\text{Result}_i = (r_u/r_s) \times D \times C_s$$

- r_u = peak response from the Sample solution
 r_s = peak response from the Standard solution
 D = dilution factor, as needed
 C_s = concentration of the Standard solution (mg/mL)

Calculate the percentage of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$) dissolved at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = C_2 \times V \times (1/L) \times 100 + \text{Result}_1$$

$$\text{Result}_3 = C_3 \times V \times (1/L) \times 100 + \text{Result}_2$$

$$\text{Result}_4 = C_4 \times V \times (1/L) \times 100 + \text{Result}_3$$

C_i = concentration of levetiracetam in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of Medium, 230 mL

L = label claim (mg/Tablet)

Tolerances: See Table 7.

Table 7

Time Point (i)	Time (h)	Amount Dissolved	
		500 mg/ Tablet (%)	750 mg/ Tablet (%)
1	1	15–35	10–30
2	2	30–50	25–45
3	4	50–75	45–70
	8	NLT 80	—
4	10	—	NLT 80

The percentages of the labeled amount of levetiracetam ($C_8H_{14}N_2O_2$), dissolved at the times specified, conform to Dissolution (711), Acceptance Table 2.

• (RB 1-Apr-2016)

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solution A: Dilute 2 mL of phosphoric acid with water to 1 L.

Diluent: Acetonitrile and Solution A (5:95)

Buffer: 1.4 g/L of anhydrous dibasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.5.

Mobile phase: Acetonitrile and Buffer (5:95). To each L of the mixture, add 1 g of sodium 1-hexanesulfonate monohydrate.

System suitability solution: 0.3 mg/mL of USP Levetiracetam RS in Diluent prepared as follows. Dissolve the required amount of USP Levetiracetam RS in 10% of the final volume of 0.1 N potassium hydroxide. Let the mixture react at room temperature for about 15 min, and then neutralize by adding 0.1 N hydrochloric acid at 10% of the flask volume. Dilute with Diluent to volume. [NOTE—This solution contains levetiracetam and levetiracetam acid.]

Standard solution: 12.5 μ g/mL of USP Levetiracetam RS in water. Sonication may be used to aid in dissolution. Pass a portion of the solution through a suitable filter of 0.2- μ m pore size.

Sample solution: Nominally equivalent to 2.5 mg/mL of levetiracetam in water, from a portion of crushed Tablets (NLT 20) prepared as follows. Transfer the weighed amount of crushed Tablet powder to a volumetric flask containing water to fill 80% of final volume. Sonicate in cold water for 10 min. Equilibrate to room temperature. Dilute with water to volume. Pass a portion through a suitable filter of 0.2- μ m pore size.

Alternatively, the Sample solution having a nominal concentration of 2–3 mg/mL of levetiracetam may be prepared as follows. Finely grind NLT 10 Tablets, and transfer an amount equivalent to one Tablet to a suitable volumetric flask. Add NLT 30 mL of acetonitrile. Sonicate for 10 min, and shake using a mechanical shaker for 10 min. Add NLT 30 mL of water, and shake for 15 min using a mechanical shaker. Allow the resulting mixture to equilibrate to room temperature. Add NMT 25% of the final flask volume of acetonitrile. Dilute with water to volume. Centrifuge for 15 min, and pass a portion through a suitable filter of 0.45- μ m pore size.

Chromatographic system

(See Chromatography (621), System Suitability.)

^a (S)-2-Aminobutanamide.^b Process impurities controlled in the drug substance. Included for identification purposes only. Not reported for the drug product, and not included in total impurities.^c (S)-2-(2-Oxopyrrolidin-1-yl)butanoic acid.^d (S)-N-(1-Amino-1-oxobutan-2-yl)-4-chlorobutanamide.**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- USP REFERENCE STANDARDS (11)**
USP Levetiracetam RS

Levmetamfetamine $C_{10}H_{15}N$ 149.23Benzeneethanamine, N, α -dimethyl-, (R)-.(-)-(R)-N, α -Dimethylphenethylamine [33817-09-3].

» Levmetamfetamine contains not less than 98.0 percent and not more than 100.5 percent of $C_{10}H_{15}N$.

Packaging and storage—Preserve in tight, light-resistant containers.**USP Reference standards (11)**—

USP Levmetamfetamine RS

USP Methamphetamine Hydrochloride RS

Identification—**A:** *Infrared Absorption* (197F).**B:** The retention time of the major peak in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *System suitability solution*, as obtained in the test for *Limit of methamphetamine*.**Specific rotation** (781S): between -18.5° and -21.5° .*Test solution:* 16 mg per mL, in 1.2 N hydrochloric acid.**Limit of methamphetamine—***Mobile phase*—Prepare a filtered and degassed mixture of hexane, isopropyl alcohol, and acetonitrile (98:1.5:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Resolution solution—Mix suitable quantities of a solution of USP Methamphetamine Hydrochloride RS in chloroform and USP Levmetamfetamine RS in chloroform to obtain a solution containing about 0.025 mg per mL and 2.5 mg per mL of methamphetamine hydrochloride and levmetamfetamine, respectively. Transfer 2.0 mL of this solution to a suitable container, add 10 mg of 2-naphthyl chloroformate and 2.0 mL of chloroform, mix with a vortex mixer, and allow to stand for 5 minutes. To this solution, add 2 mL of 1 N sodium hydroxide, mix with a vortex mixer, allow to stand for 5 minutes, and discard the aqueous layer. Wash the organic layer twice with 2 mL of 1 N sodium hydroxide, discarding the aqueous layer. To the organic layer add 2 mL of 1 N hydrochloric acid, mix with a vortex mixer, and discard the aqueous layer. Wash the organic layer twice with 2 mL of 1 N hydrochloric acid, discarding the aqueous layer. To the organic layer add 2 mL of water, mix with a vortex mixer, and discard the aqueous layer. Wash the organic layer twice with 2 mL of water, discarding the aqueous layer. To the organic layer add about 1.0 g of anhydrous sodium sulfate, and mix with a vortex mixer. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter.

Test solution—Transfer about 62.5 mg of Levmetamfetamine, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with chloroform to volume, and mix. Transfer 2.0 mL of this solution to a suitable container, and proceed as directed in *Resolution solution* beginning with "add 10 mg of 2-naphthyl chloroformate and 2 mL of chloroform."

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 274-nm detector and a 4.6-mm \times 25-cm column that contains packing L36. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for methamphetamine and 1.0 for levmetamfetamine; and the resolution, R , between methamphetamine and levmetamfetamine is not less than 1.4. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 50 μ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the percentage of methamphetamine in the portion of Levmetamfetamine taken by the formula:

$$100r_M / (r_M + r_L)$$

in which r_M is the methamphetamine peak response obtained from the *Test solution*, and r_L is the peak response of levmetamfetamine obtained from the *Test solution*: not more than 0.1% is found.

Limit of nonvolatile residue—Heat about 1.0 g, accurately weighed, at 150° to constant weight: the limit is not more than 0.5%.

Ordinary impurities (466)—

Test solution: chloroform.

Standard solution: chloroform.

Eluant: a mixture of chloroform, cyclohexane, and diethylamine (5:4:1).

Visualization: 1.

Limits—No impurity exceeds 0.1%, and the total does not exceed 0.5%.

Assay—Transfer about 400 mg of Levmetamfetamine to a suitable container, add 50.0 mL of glacial acetic acid, and mix. Add two drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 14.92 mg of $C_{10}H_{13}N$.

Levobunolol Hydrochloride

$C_{17}H_{25}NO_3 \cdot HCl$ 327.85
 1-(2*H*)-Naphthalenone, 5-[3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]-3,4-dihydro-, hydrochloride, (–)-(S); (–)-5-[3-(*tert*-Butylamino)-2-hydroxypropoxy]-3,4-dihydro-1(2*H*)-naphthalenone hydrochloride [27912-14-7].

DEFINITION

Levobunolol Hydrochloride contains NLT 98.0% and NMT 102.0% of levobunolol hydrochloride ($C_{17}H_{25}NO_3 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- A. INFRARED ABSORPTION** (197M)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

ASSAY**PROCEDURE**

Solution A: 5 mM sodium 1-heptanesulfonate in methanol

Solution B: 5 mM sodium 1-heptanesulfonate in water
Mobile phase: *Solution A*, 0.5 M sulfuric acid, and *Solution B* (53:1:47)

Standard solution: 100 µg/mL of USP Levobunolol Hydrochloride RS in *Mobile phase*

Calculate the percentage of the labeled amount of levobunolol hydrochloride ($C_{17}H_{25}NO_3 \cdot HCl$) in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levobunolol Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levobunolol hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

ORGANIC IMPURITIES

Mobile phase: Proceed as directed in the *Assay*.

Standard solution: 10 µg/mL each of USP Levobunolol Hydrochloride RS and USP Edetate Disodium RS in *Mobile phase*

Sample solution: Nominally equivalent to 1 mg/mL of levobunolol hydrochloride in *Mobile phase* from Ophthalmic Solution

Chromatographic system and System suitability: Proceed as directed in the *Assay* using wavelengths of UV 254 nm and 400 nm.

[NOTE—The relative retention times for levobunolol and edetate disodium are 1.0 and 0.46, respectively.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity at 254 nm in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of levobunolol from the *Standard solution*

C_S = concentration of USP Levobunolol Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of levobunolol hydrochloride in the *Sample solution* (µg/mL)

Calculate the percentage of any impurity at the retention time of levobunolol (obtained using the detector at 254 nm) using the detector at 400 nm in the portion of Ophthalmic Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of the impurity from the *Sample solution* at 400 nm

r_S = peak response of levobunolol from the *Standard solution* at 254 nm

C_S = concentration of USP Levobunolol Hydrochloride RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of levobunolol hydrochloride in the *Sample solution* (µg/mL)

F = relative response factor for the impurity, 0.2

Acceptance criteria

Individual impurity: NMT 1%

Total impurities: NMT 2.5%. Disregard any peak obtained with the detector at 254 nm with the retention time of edetate disodium.

SPECIFIC TESTS

- ANTIMICROBIAL EFFECTIVENESS TESTING (51):** Meets the requirements
- STERILITY TESTS (71):** Meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- PH (791):** 5.5–7.5

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Protect from light. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
USP Edetate Disodium RS
USP Levobunolol Hydrochloride RS

Levocabastine Hydrochloride

$C_{26}H_{29}FN_2O_2 \cdot HCl$ 456.98
4-Piperidinecarboxylic acid, 1-[4-cyano-4-(4-fluorophenyl)cyclohexyl]-3-methyl-4-phenyl-, monohydrochloride, (–)-[1(*cis*), 3 α , 4 β]-;
(–)-*trans*-1-[*cis*-4-Cyano-4-(*p*-fluorophenyl)cyclohexyl]-3-methyl-4-phenylisopropionic acid monohydrochloride [79547-78-7].

DEFINITION

Levocabastine Hydrochloride contains NLT 98.5% and NMT 101.5% of $C_{26}H_{29}FN_2O_2 \cdot HCl$, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL**, Chloride (191): Meets the requirements
- **C. OPTICAL ROTATION**, Specific Rotation (781S): Meets the requirements

ASSAY• **PROCEDURE**

Sample solution: Dissolve 175 mg of Levocabastine Hydrochloride in 50 mL of alcohol, and add 5.0 mL of 0.01 N hydrochloric acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Potentiometric

Analysis

Sample: *Sample solution*

The volume of titrant required to titrate Levocabastine Hydrochloride is the difference between the first and third endpoints. Perform a blank determination and make any necessary correction. Each mL of 0.1 N sodium hydroxide VS is equivalent to 22.85 mg of $C_{26}H_{29}FN_2O_2 \cdot HCl$.

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%, based on a sample weight of about 1.000 g

Organic Impurities• **PROCEDURE**

[NOTE—Prepare solutions immediately before use.]

Diluent: 2 mg/mL of sodium hydroxide in water

Solution A: Dissolve 1.39 g of boric acid in water, and adjust with 1 N sodium hydroxide to a pH of 9.0. Dilute with water to 100 mL.

Run buffer: Dissolve 1.08 g of sodium dodecyl sulfate and 650 mg of hydroxypropyl- β -cyclodextrin in 5 mL of isopropyl alcohol, then dilute with *Solution A* to 50 mL.

System suitability solution: 12.5 μ g/mL of USP Levocabastine Hydrochloride RS and 12.5 μ g/mL of USP Levocabastine Related Compound A RS in *Diluent*

Standard solution: Dilute 5.0 mL of the *Sample solution* with *Diluent* to 100 mL. Dilute 1.0 mL of this solution with *Diluent* to 10 mL to obtain a solution containing 12.5 μ g/mL of Levocabastine Hydrochloride.

Sample solution: 2.5 mg/mL of Levocabastine Hydrochloride in *Diluent*

Capillary electrophoresis system

Detector: UV 214 nm

Column: 75- μ m \times 50-cm uncoated fused-silica capillary column

Column temperature: 50°

Current: See the gradient table below.

Time (min)	Current (μ A)
0	0
0.17	75
15	130
40	130
60	200

[NOTE—Before performing the *System suitability*, equilibrate the capillary column with *Diluent* for 2 min, then equilibrate with *Run buffer* for at least 5 min.]

System suitability

Sample: *System suitability solution*

[NOTE—The relative migration times for levocabastine and levocabastine related compound A are approximately 1.0 and 1.07, respectively.]

Suitability requirements

Resolution: NLT 4 between levocabastine and levocabastine related compound A

[NOTE—If necessary, adjust the current gradient to achieve the required resolution.]

Analysis

Samples: *Diluent* (blank), *Standard solution*, and *Sample solution*

Separately inject equal volumes (pressure of 3450 Pa for 5 s) of the *Samples*, and record the peak responses.

[NOTE—Disregard any peak originating from the *Diluent*. Disregard any peak with an area of less than 0.1 times the major peak area of the *Standard solution* (0.05%).]

Acceptance criteria: The area for any peak in the *Sample solution*, other than the major peak, is not greater than the major peak area of the *Standard solution* (0.5%); and the sum of all peak areas in the *Sample solution*, except for the major peak, is not greater than twice the major peak area of the *Standard solution* (1.0%).

SPECIFIC TESTS

- **OPTICAL ROTATION**, Specific Rotation (781S): -102° to -106° at 20°

Sample solution: 10 mg/mL in methanol

- **LOSS ON DRYING** (731): Dry about 1.000 g of the sample at 105° to constant weight: it loses NMT 0.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Protect from light.

- **USP REFERENCE STANDARDS** (11)

USP Levocabastine Hydrochloride RS

USP Levocabastine Related Compound A RS

Levocarnitine

$C_7H_{15}NO_3$ 161.20
(*R*)-3-Carboxy-2-hydroxy-*N,N,N*-trimethyl-1-propanaminium, inner salt;
(*R*)-(3-Carboxy-2-hydroxypropyl)trimethylammonium, inner salt [541-15-1].

DEFINITION

Levocarnitine contains NLT 97.0% and NMT 103.0% of levocabastine ($C_7H_{15}NO_3$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Analysis: Dry the sample and the USP Levocabastine RS under vacuum at 50° for 5 h.

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Sample: 100 mg of Levocabastine

Blank: A mixture of 3 mL of formic acid and 50 mL of glacial acetic acid

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in a mixture of 3 mL of formic acid and 50 mL of glacial acetic acid. Add

2 drops of crystal violet TS, and titrate with the *Titrant* to an emerald green endpoint. Perform the *Blank* determination.

Calculate the percentage of levocarnitine ($C_7H_{15}NO_3$) in the portion of Levocarnitine taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F] / W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 161.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.5%

• **CHLORIDE AND SULFATE**, *Chloride* (221)

Standard: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.090 g of Levocarnitine

Acceptance criteria: NMT 0.4%

Delete the following:

• **HEAVY METALS** (231): NMT 20 ppm (Official 1-Jan-2018)

• **LIMIT OF POTASSIUM**

[NOTE—The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Standard solution: 31.25 µg/mL of potassium in water, prepared from potassium chloride, previously dried at 105° for 2 h

Sample stock solution: 0.625 mg/mL of Levocarnitine in water

Sample solution A: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with water to volume. This solution contains 500 µg/mL of Levocarnitine and 0 µg/mL of added potassium from the *Standard solution*.

Sample solution B: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, add 2.0 mL of the *Standard solution*, and dilute with water to volume. This solution contains 500 µg/mL of Levocarnitine and 2.5 µg/mL of added potassium from the *Standard solution*.

Sample solution C: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, add 4.0 mL of the *Standard solution*, and dilute with water to volume. This solution contains 500 µg/mL of Levocarnitine and 5.0 µg/mL of added potassium from the *Standard solution*.

Blank: Water

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 766.7 nm

Lamp: Potassium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Sample solution A*, *Sample solution B*, *Sample solution C*, and *Blank*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the three *Sample solutions* versus their added potassium concentrations, in µg/mL. Draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the

concentration, in µg/mL, of potassium in *Sample solution A*.

Calculate the percentage of potassium in the portion of Levocarnitine taken:

$$\text{Result} = (C_K / C_U) \times 100$$

C_K = concentration of potassium in *Sample solution A* (µg/mL), determined from the intercept of the linear regression line

C_U = concentration of Levocarnitine in *Sample solution A* (µg/mL)

Acceptance criteria: NMT 0.2%

• LIMIT OF SODIUM

[NOTE—The *Standard solution* and the *Sample solutions* may be modified, if necessary, to obtain solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Standard solution: 250 µg/mL of sodium in water, prepared from sodium chloride, previously dried at 105° for 2 h

Sample stock solution: 40.0 mg/mL of Levocarnitine in water

Sample solution A: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with water to volume. This solution contains 32 mg/mL of Levocarnitine and 0 µg/mL of added sodium from the *Standard solution*.

Sample solution B: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, add 2.0 mL of the *Standard solution*, and dilute with water to volume. This solution contains 32 mg/mL of Levocarnitine and 20 µg/mL of added sodium from the *Standard solution*.

Sample solution C: Transfer 20.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, add 4.0 mL of the *Standard solution*, and dilute with water to volume. This solution contains 32 mg/mL of Levocarnitine and 40 µg/mL of added sodium from the *Standard solution*.

Blank: Water

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 589.0 nm

Lamp: Sodium hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Sample solution A*, *Sample solution B*, *Sample solution C*, and *Blank*

Determine the absorbances of the solutions against the *Blank*. Plot the absorbances of the three *Sample solutions* versus their added sodium concentrations, in µg/mL. Draw the straight line best fitting the three points, and extrapolate the line until it intercepts the concentration axis. From the intercept determine the concentration, in µg/mL, of sodium in *Sample solution A*.

Calculate the percentage of sodium in the portion of Levocarnitine taken:

$$\text{Result} = (C_{Na} / C_U) \times 100$$

C_{Na} = concentration of sodium in *Sample solution A* (µg/mL), determined from the intercept of the linear regression line

C_U = concentration of Levocarnitine in *Sample solution A* (µg/mL)

Acceptance criteria: NMT 0.1%

SPECIFIC TESTS

Levocarnitine Injection

DEFINITION

Levocarnitine Injection is a sterile solution of Levocarnitine in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of levocarnitine ($C_7H_{15}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **B. COLOR REACTION**
Analysis: Transfer 2 mL of Injection to a test tube, add 5 mL of 1 N hydrochloric acid and a few drops of ammonium reineckate TS.
Acceptance criteria: A red-violet precipitate is produced.

ASSAY

• PROCEDURE

Buffer: 0.05 M phosphate buffer, prepared by dissolving 6.805 g of monobasic potassium phosphate in 1 L of water

Mobile phase: Acetonitrile and *Buffer* (65:35). Adjust with phosphoric acid to a pH of 4.7, and mix.

System suitability solution: 5 mg/mL of USP Levocarnitine RS and 0.024 mg/mL of USP Levocarnitine Related Compound A RS in water

Standard solution: 10 mg/mL of USP Levocarnitine RS in water

Sample solution: Pool the contents of 10 containers, and dilute an accurately measured volume of Injection quantitatively with water to obtain a solution having a nominal concentration of about 10 mg/mL of levocarnitine.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L8

Flow rate: 1 mL/min

Injection volume: 5 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.0 between levocarnitine related compound A (crotonylbetaine) and levocarnitine, *System suitability solution*

Relative standard deviation: NMT 2.0% for levocarnitine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levocarnitine ($C_7H_{15}NO_3$) in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of levocarnitine from the *Sample solution*

r_s = peak area of levocarnitine from the *Standard solution*

C_s = concentration of USP Levocarnitine RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of levocarnitine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.1 USP Endotoxin Units/mg of levocarnitine.
- **pH (791):** 6.0–6.5
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **INJECTIONS AND IMPLANTED DRUG PRODUCTS (1):** Meets the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass. Store below 25°. Do not freeze.

Levocarnitine Oral Solution

DEFINITION

Levocarnitine Oral Solution is a solution of levocarnitine in water, and it contains suitable antimicrobial agents. It may contain a suitable flavor. It contains NLT 90.0% and NMT 110.0% of the labeled amount of levocarnitine ($C_7H_{15}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, both relative to the internal standard, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 0.05 M phosphate buffer, pH 2.4, prepared by mixing 11.5 mL of phosphoric acid, 1900 mL of water, and about 100 mL of 1 N sodium hydroxide

Mobile phase: Dissolve 555 mg of sodium 1-heptanesulfonate in 980 mL of *Buffer* with stirring. Add 20 mL of methanol, and mix.

Internal standard solution: 0.02 mg/mL of *p*-aminobenzoic acid in water

Standard solution: Transfer about 10 mg of USP Levocarnitine RS to a 5-mL volumetric flask, add 1.0 mL of the *Internal standard solution*, and dilute with water to volume.

Sample stock solution: Equivalent to 10 mg/mL of levocarnitine in water from an accurately measured volume of Oral Solution

Sample solution: Wash a 10-mm \times 4-cm disposable column containing 500 mg of packing L1, in order,

with two column volumes of methylene chloride, two column volumes of methanol, and three column volumes of water. Pipet 5.0 mL of the *Sample stock solution* into the washed disposable column, and rinse the column twice with 6.0-mL portions of water. Collect the filtrate and washings in a 25-mL volumetric flask, add 5.0 mL of the *Internal standard solution*, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 3.9-mm × 30-cm; 10-μm packing L1

Flow rate: 1.5 mL/min

Injection size: 40 μL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for levocarnitine and *p*-aminobenzoic acid are 0.56 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the levocarnitine and internal standard peaks

Relative standard deviation: NMT 2.0% for levocarnitine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levocarnitine ($C_7H_{15}NO_3$) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of levocarnitine to *p*-aminobenzoic acid from the *Sample solution*

R_S = peak area ratio of levocarnitine to *p*-aminobenzoic acid from the *Standard solution*

C_S = concentration of USP Levocarnitine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levocarnitine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **PH** (791): 4.0–6.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)
USP Levocarnitine RS

Levocarnitine Tablets

DEFINITION

Levocarnitine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levocarnitine ($C_7H_{15}NO_3$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

- **B. COLOR REACTION**

Analysis: Dissolve 1 Tablet in 5 mL of water, filter, and add 5 mL of 1 N hydrochloric acid. Place 2 mL of the filtrate in a test tube, and add a few drops of ammonium reineckate TS.

Acceptance criteria: A red-violet precipitate is produced.

ASSAY

• PROCEDURE

Buffer: 0.05 M phosphate buffer, pH 4.5, prepared by dissolving 6.805 g of monobasic potassium phosphate in 1 L of water

Mobile phase: Acetonitrile and *Buffer* (65:35). Adjust with phosphoric acid to a pH of 4.7, and mix.

System suitability solution: 1.5 mg/mL of USP Levocarnitine RS and 7 μg/mL of USP Levocarnitine Related Compound A RS in water

Standard solution: 3 mg/mL of USP Levocarnitine RS in water

Sample solution: Transfer 10 Tablets, accurately weighed, to a 500-mL volumetric flask, and add water to volume. Shake until the Tablets have disintegrated completely, and pass through a filter of 0.45-μm pore size. Dilute a portion of the filtrate quantitatively with water to a nominal concentration of about 3 mg/mL of levocarnitine.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 205 nm

Column: 3.9-mm × 30-cm; 10-μm packing L8

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.0 between levocarnitine related compound A (crotonoylbetaine) and levocarnitine, *System suitability solution*

Relative standard deviation: NMT 2.0% for levocarnitine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levocarnitine ($C_7H_{15}NO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak area of levocarnitine from the *Sample solution*

r_S = peak area of levocarnitine from the *Standard solution*

C_S = concentration of USP Levocarnitine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levocarnitine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DISSOLUTION** (711)

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Standard solution: Known concentration of USP Levocarnitine RS in *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with *Medium* if necessary

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the Assay, making any necessary modifications.

Determine the percentage of the labeled amount of levocarnitine ($C_7H_{15}NO_3$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S \times D \times V/L) \times 100$$

r_U = peak area of levocarnitine in the *Sample solution*

r_S = peak area of levocarnitine in the *Standard solution*

- C_s = concentration of USP Levocarnitine RS in the *Standard solution* (mg/mL)
 D = dilution factor for the *Sample solution*
 V = volume of *Medium*, 900 mL
 L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of levocarnitine ($C_7H_{15}NO_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation*

ORGANIC IMPURITIES

Mobile phase: Acetonitrile, water, and 1 M sulfuric acid (93: 6.6: 0.4)

System suitability solution: 0.2 mg/mL of USP Levocetirizine Dihydrochloride RS and 0.2 μ g/mL each of USP Levocetirizine Amide RS and USP Chlorobenzhydryl Piperazine RS in *Mobile phase*. Use the solution within 16 h.

Standard solution: 0.2 μ g/mL each of USP Levocetirizine Dihydrochloride RS, USP Levocetirizine Amide RS, and USP Chlorobenzhydryl Piperazine RS in *Mobile phase*. Use the solution within 16 h.

Sample solution: 200 μ g/mL of Levocetirizine Dihydrochloride in *Mobile phase*. Use the solution within 16 h.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L3

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: 3 times the retention time of levocetirizine

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between levocetirizine and chlorobenzhydryl piperazine, *System suitability solution*

Tailing factor: NMT 2.0 for levocetirizine, *System suitability solution*

Relative standard deviation: NMT 5.0% for levocetirizine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of levocetirizine amide or chlorobenzhydryl piperazine in the portion of Levocetirizine Dihydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of levocetirizine amide or chlorobenzhydryl piperazine from the *Sample solution*

r_S = peak response of levocetirizine amide or chlorobenzhydryl piperazine from the *Standard solution*

C_S = concentration of USP Levocetirizine Amide RS or USP Chlorobenzhydryl Piperazine RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Levocetirizine Dihydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Calculate the percentage of any unspecified impurity in the portion of Levocetirizine Dihydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any unspecified impurity from the *Sample solution*

r_S = peak response of levocetirizine from the *Standard solution*

C_S = concentration of USP Levocetirizine Dihydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = concentration of Levocetirizine Dihydrochloride in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Levocetirizine dihydrochloride	1.0	—
Chlorobenzhydryl piperazine	1.3	0.2% (RB 1-Apr-2016)
Levocetirizine amide	2.5	0.2% (RB 1-Apr-2016)
Any individual unspecified impurity	—	0.1% (RB 1-Apr-2016)
Total impurities	—	0.5% (RB 1-Apr-2016)

Change to read:

• **ENANTIOMERIC PURITY**

Analyze the solutions within 24 h of preparation.

Mobile phase: Prepare a mixture of chromatographic solvent hexane and absolute alcohol (95:5). Add 2 mL of trifluoroacetic acid per L of mixture.

System suitability solution: 5 mg/mL of USP Cetirizine Hydrochloride RS in absolute alcohol

Sensitivity solution: 0.05 mg/mL of USP Levocetirizine Dihydrochloride RS in absolute alcohol

Sample solution: 5 mg/mL of Levocetirizine Dihydrochloride in absolute alcohol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L40

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

[NOTE—The relative retention times for the S-enantiomer (of cetirizine) and levocetirizine, which is the R-enantiomer of cetirizine, are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.5 between the S-enantiomer and levocetirizine, *System suitability solution*

Signal-to-noise ratio: NLT 10 for levocetirizine, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of the S-enantiomer in the portion of Levocetirizine Dihydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for the S-enantiomer from the *Sample solution*

r_T = sum of all the peak responses for the S-enantiomer and levocetirizine from the *Sample solution*

Acceptance criteria: NMT 2.0% (RB 1-Apr-2016) of the S-enantiomer

SPECIFIC TESTS**Change to read:**

• **LOSS ON DRYING** (731)

Analysis: Dry at 105° to constant weight.

Acceptance criteria: NMT 1.0% (RB 1-Apr-2016)

• **PH** (791)

Sample solution: 50 mg/mL of Levocetirizine Dihydrochloride in water

Acceptance criteria: 1.2–1.8

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light at controlled room temperature.

• **USP REFERENCE STANDARDS** (11)

USP Cetirizine Hydrochloride RS

USP Chlorobenzhydryl Piperazine RS

(R)-1-[(4-Chlorophenyl)phenylmethyl]piperazine.

$\text{C}_{17}\text{H}_{19}\text{ClN}_2$ 286.80

USP Levocetirizine Dihydrochloride RS

Levocetirizine Dihydrochloride Tablets**DEFINITION**

Levocetirizine Dihydrochloride Tablets contain NLT 90% and NMT 110% of the labeled amount of levocetirizine dihydrochloride ($\text{C}_{21}\text{H}_{25}\text{ClN}_2\text{O}_3 \cdot 2\text{HCl}$).

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION** (197U)

Medium: Water

Sample solution: Nominally 0.1 mg/mL of levocetirizine dihydrochloride from Tablets in water prepared as follows. Transfer 1 Tablet to a suitable volumetric

flask, and add 40% of the flask volume of water. Shake for NLT 5 min to promote the disintegration of the Tablet. Dilute with water to volume. Pass a 10-mL portion of the resulting solution through a suitable filter, and discard the first mL. Use the filtrate.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: 1 M sulfuric acid and water (5.7: 94.3)

Mobile phase: Acetonitrile, water, and 1 M sulfuric acid (93: 6.6: 0.4)

System suitability solution: 0.2 mg/mL of USP Levocetirizine Dihydrochloride RS and 0.2 µg/mL of USP Chlorobenzhydryl Piperazine RS in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Levocetirizine Dihydrochloride RS in *Mobile phase*

Sample solution: Nominally 0.2 mg/mL of levocetirizine dihydrochloride prepared as follows. Transfer a number of Tablets (NLT 10), equivalent to 50 mg of levocetirizine dihydrochloride, to a 250-mL volumetric flask. Add 20 mL of *Solution A*, and put the flask on a mechanical shaker for 15 min. Add 150 mL of acetonitrile, and place the flask in an ultrasonic bath for 10 min. Allow the contents to cool to room temperature, if necessary, and dilute with acetonitrile to final volume. Homogenize the solution, and centrifuge a 10-mL portion for 5 min. Use the supernatant solution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Columns

Guard: 4-mm × 0.3-cm; 5-µm packing L3

Analytical: 4.6-mm × 25-cm; 5-µm packing L3

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between levocetirizine and chlorobenzhydryl piperazine

Tailing factor: NMT 1.5 for levocetirizine

Relative standard deviation: NMT 1.0% for levocetirizine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levocetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of levocetirizine from the *Sample solution*

r_S = peak response of levocetirizine from the *Standard solution*

C_S = concentration of USP Levocetirizine Dihydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levocetirizine dihydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90%–110%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: (L/900) mg/mL of USP Levocetirizine Dihydrochloride RS in *Medium*, where L is the label claim in mg/Tablet

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV-Vis

Analytical wavelength: 230 or 231 nm; use a suitable wavelength for background correction

Cell: 1 or 2 cm

Blank: *Medium*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of levocetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Levocetirizine Dihydrochloride RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of levocetirizine dihydrochloride ($C_{21}H_{25}ClN_2O_3 \cdot 2HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

ORGANIC IMPURITIES

Solution A, Mobile phase, System suitability solution, and Sample solution: Prepare as directed in the *Assay*.

Standard solution: 0.002 mg/mL of USP Levocetirizine Dihydrochloride RS in *Mobile phase*

Chromatographic system: Proceed as directed in the *Assay*, except for the *Run time*.

Run time: 2.3 times the retention time of levocetirizine

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between levocetirizine and chlorobenzhydryl piperazine

Tailing factor: NMT 1.5 for levocetirizine

Relative standard deviation: NMT 1.0% for levocetirizine; NMT 5.0% for chlorobenzhydryl piperazine

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of levocetirizine from the *Standard solution*

C_S = concentration of USP Levocetirizine Dihydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levocetirizine dihydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of levocetirizine (free base), 388.89

M_{r2} = molecular weight of levocetirizine dihydrochloride, 461.81

Acceptance criteria: See Table 1. Disregard peaks less than 0.1%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Levocetirizine	1.0	—
Chlorobenzhydryl piperazine ^a	1.4	—
Levocetirizine amide ^{a,b}	2.1	—
Any individual unspecified degradation product	—	0.30
Total impurities	—	1.0

^a This is a process impurity that is included in this table for identification only. This impurity is controlled in the drug substance. This impurity is not to be reported for the drug product and is not to be included in the total impurities.

^b (R)-2-(2-[(4-(4-Chlorophenyl)phenylmethyl)piperazin-1-yl]ethoxy)-acetamide.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Chlorobenzhydryl Piperazine RS
(R)-1-[(4-Chlorophenyl)phenylmethyl]piperazine.

USP Levocetirizine Dihydrochloride RS

Levodopa

$C_9H_{11}NO_4$ 197.19
L-Tyrosine, 3-hydroxy-;
(-)-3-(3,4-Dihydroxyphenyl)-L-alanine [59-92-7].

DEFINITION

Levodopa contains NLT 98.0% and NMT 102.0% of levodopa ($C_9H_{11}NO_4$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Protect all solutions from light, and maintain them at 10° until they are injected into the chromatograph.

Diluent: 0.1% trifluoroacetic acid in water

Mobile phase: Tetrahydrofuran and *Diluent* (3:97)

System suitability solution: 10 µg/mL each of USP Levodopa RS, USP Levodopa Related Compound B RS, and USP L-Tyrosine RS in *Diluent*

Standard solution: 0.4 mg/mL of USP Levodopa RS in *Diluent*

Sample solution: 0.4 mg/mL of Levodopa in *Diluent*

Chromatographic system
(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm L1 packing

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—Refer to Table 1 in the test for *Organic Impurities* for the relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between levodopa and L-tyrosine

Tailing factor: NMT 2.0 for levodopa

Relative standard deviation: NMT 2.0 for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levodopa ($C_9H_{11}NO_4$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the *Sample solution*

r_S = peak response of the *Standard solution*

C_S = concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U = concentration of Levodopa in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II (231):** NMT 20 ppm (Official 1, Jan-2018)

ORGANIC IMPURITIES

Protect all solutions from light, and maintain them at 10° until they are injected into the chromatograph.

Diluent, Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Levodopa taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area for any impurity in the *Sample solution*

r_S = peak area for Levodopa in the *Standard solution*

C_S = concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U = concentration of Levodopa in the *Sample solution* (mg/mL)

F = relative response factor of each impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Levodopa related compound A ^a	0.9	0.41	0.1
Levodopa	1.0	—	—
L-Tyrosine	1.3	0.44	0.1

^a 3-(3,4,6-Trihydroxyphenyl)alanine.

^b 3-(3,4-Dimethoxyphenyl)-L-alanine.

Table 1 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Levodopa related compound B	1.6	0.83	0.5
L-Veratrylglycine ^b	2.7	0.76	0.1
Individual unknown impurity	—	1.0	0.1
Total impurities	—	—	1.1

^a 3-(3,4,6-Trihydroxyphenyl)alanine.^b 3-(3,4-Dimethoxyphenyl)-L-alanine.**SPECIFIC TESTS**• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 500 mg of Levodopa in a 25-mL volumetric flask. Add 10 mL of 1 N hydrochloric acid to dissolve the solid, add 5 g of methenamine, swirl the contents to dissolve the methenamine, and add 1 N hydrochloric acid to volume.

Analysis: Allow the *Sample solution* to stand in the dark at 25° for 3 h, and measure the rotation.

Acceptance criteria: −160° to −167°

• **LOSS ON DRYING (731)**

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, store in a dry place, and prevent exposure to excessive heat.

• **USP REFERENCE STANDARDS (11)**

USP Levodopa RS

USP Levodopa Related Compound B RS

3-Methoxytyrosine.

C₁₀H₁₃NO₄ 211.22

USP L-Tyrosine RS

Levodopa Capsules**DEFINITION**

Levodopa Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of levodopa (C₉H₁₁NO₄).

IDENTIFICATION• **A. INFRARED ABSORPTION (197M)**

Sample: Shake a quantity of the contents of the Capsules, equivalent to about 500 mg of levodopa, with 25 mL of 3 N hydrochloric acid, and filter. Adjust the acidity of the filtrate with 6 N ammonium hydroxide to a pH of 3, added dropwise with stirring, and allow to stand protected from light for several h. Filter, wash the precipitate with water, and dry at 105°.

Acceptance criteria: The residue meets the requirements.

ASSAY• **PROCEDURE**

Standard solution: 35 µg/mL of USP Levodopa RS in 0.1 N hydrochloric acid

Sample stock solution: 1.75 mg/mL of levodopa in 0.1 N hydrochloric acid, from the contents of NLT 20 Capsules. Shake the mixture by mechanical means for 5 min, and filter discarding the first 20 mL of the filtrate.

Sample solution: 35 µg/mL of levodopa in 0.1 N hydrochloric acid from the *Sample stock solution*

Blank: 0.1 N hydrochloric acid

Instrumental conditions

Mode: UV-Vis

Cell: 1 cm

Analytical wavelength: 280 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levodopa (C₉H₁₁NO₄) in the portion of Capsule contents taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Levodopa RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of levodopa in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 280 nm

Standard solution: USP Levodopa RS in *Medium*

Sample solution: *Sample per Dissolution (711)*. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of levodopa (C₉H₁₁NO₄) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

[NOTE—Use low-actinic glassware for all volumetric solutions.]

Diluent: Dissolve 100 mg of sodium metabisulfite in 10 mL of 1.2 N hydrochloric acid, and dilute with acetone to 100 mL.

Standard solution A: 10 µg/mL of USP Levodopa Related Compound A RS and 10 mg/mL of USP Levodopa RS in *Diluent*

Standard solution B: 50 µg/mL of USP Levodopa Related Compound B RS in *Diluent*

Sample solution: Just prior to application, dissolve 100 mg of the residue obtained in the *Identification* test in 10.0 mL of *Diluent*.

Chromatographic system

(See *Chromatography (621)*, *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: Thin-layer chromatographic plate, coated with a 0.25-mm layer of microcrystalline cellulose
Predevelop a plate in *Developing solvent* until the solvent front has moved NLT 18 cm from the origin.
 Remove the plate from the chamber, and dry in a current of air for about 10 min.

[NOTE—The plate may be developed overnight: solvent overflow during predevelopment is of no consequence.]

Application volume: 10 µL

Developing solvent: Butyl alcohol, methanol, glacial acetic acid, and water (150:15:75:75)

Spray reagent: Just before use, mix 2 volumes of ferric chloride solution (100 mg/mL) with 1 volume of potassium ferricyanide solution (50 mg/mL) to obtain about 100 mL of solution.

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Apply the *Samples* at separate points about 3 cm from the bottom of the plate. Dry the spots in a stream of nitrogen, and develop the chromatogram in a suitable low-actinic chamber equilibrated for 5 min with a freshly mixed portion of *Developing solvent* until the solvent front has moved about 15 cm from the line of application. Remove the plate from the chamber, mark the solvent front, and dry in a current of air for about 10 min. Spray the plate with *Spray reagent*. Levodopa related compound A produces a spot at an R_f of about 0.25, and levodopa related compound B at an R_f of about 0.5.

Acceptance criteria: No spot at R_f 0.25 from the *Sample solution* is greater in size or intensity than the corresponding spot from *Standard solution A* corresponding to NMT 0.1% levodopa related compound A. No spot at R_f 0.5 from the *Sample solution* is greater in size or intensity than the corresponding spot from *Standard solution B* corresponding to NMT 0.5% of levodopa related compound B. [NOTE—Disregard the bleached spot, which is an artifact resulting from the development of sodium metabisulfate from *Diluent*. It may appear at an R_f value of about 0.6.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a dry place, and prevent exposure to excessive heat.
- **USP REFERENCE STANDARDS (11)**
 - USP Levodopa RS
 - USP Levodopa Related Compound A RS
3-(3,4,6-Trihydroxyphenyl)alanine.
 $C_9H_{11}NO_5$ 213.19
 - USP Levodopa Related Compound B RS
3-Methoxytyrosine.
 $C_{10}H_{13}NO_4$ 211.22

Levodopa Tablets**DEFINITION**

Levodopa Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levodopa ($C_9H_{11}NO_4$).

IDENTIFICATION• **A. INFRARED ABSORPTION (197M)**

Sample: Shake a quantity of powdered Tablets equivalent to 500 mg of levodopa with 25 mL of 3 N hydrochloric acid, and filter. Adjust the acidity of the filtrate with 6 N ammonium hydroxide, added dropwise with stirring, and allow to stand, protected from light, for several h. Filter, wash the precipitate with water, and dry at 105°.

Acceptance criteria: The residue meets the requirements.

ASSAY• **PROCEDURE**

Protect all solutions from light, and maintain them at 10° until they are injected into the chromatograph.

Mobile phase: 0.01 M monobasic potassium phosphate; adjust with phosphoric acid and acetonitrile (97:3) to a pH of 2.0.

Standard solution: 0.4 mg/mL of USP Levodopa RS in *Mobile phase*

Sample solution: 0.4 mg/mL of levodopa in *Mobile phase*, from finely powdered Tablets (NLT 20). Filter. Sonicate for 5 min.

System suitability solution: 10 µg/mL each of USP Levodopa RS, USP Levodopa Related Compound B RS,

and USP Levodopa Related Compound A RS in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.0-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for levodopa related compound A, levodopa, and levodopa related compound B are 0.7, 1.0, and 2.8, respectively.]

Suitability requirements

Resolution: NLT 3.5 between levodopa related compound A and levodopa

Relative standard deviation: NMT 2.0% for levodopa

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levodopa ($C_9H_{11}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levodopa in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Detector: UV maximum at about 280 nm

Standard solution: USP Levodopa RS in *Medium*

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of levodopa ($C_9H_{11}NO_4$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Protect all solutions from light, and maintain them at 10° until they are injected into the chromatograph.

Mobile phase, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability: Prepare as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area for any impurity from the *Sample solution*

r_S = peak area for levodopa from the *Standard solution*

C_S = concentration of USP Levodopa RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levodopa in the *Sample solution* (mg/mL)

F = relative response factor of the impurity (see *Table 1*)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Levodopa related compound A	0.9	0.83	0.1
Levodopa	1.0	—	—
Levodopa related compound B	2.8	0.83	0.5
5,6-Dihydroxy-indole-2-carboxylic acid	6.0	2.5	0.1
Unknown impurities	—	1.0	0.1 individual 0.3 total unknown
Total impurities	—	—	1.1

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, in a dry place, and prevent exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)
 - USP Levodopa RS
 - USP Levodopa Related Compound A RS
3-(3,4,6-Trihydroxyphenyl)alanine.
 $C_9H_{11}NO_5$ 213.19
 - USP Levodopa Related Compound B RS
3-Methoxytyrosine.
 $C_{10}H_{13}NO_4$ 211.22

Levofloxacin

$C_{18}H_{20}FN_3O_4 \cdot 1/2H_2O$ 370.38
 7H-Pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid,
 9-fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-
 7-oxo-hydrate (2:1), (S)-;
 (–)-(S)-9-Fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid, hemihydrate [138199-71-0].
 Anhydrous [100986-85-41].

DEFINITION

Levofloxacin contains NLT 98.0% and NMT 102.0% of $C_{18}H_{20}FN_3O_4$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer: 8.5 g/L of ammonium acetate, 1.25 g/L of cupric sulfate, pentahydrate, and 1.3 g/L of L-isoleucine in water

Mobile phase: Methanol and *Buffer* (3:7)

Standard solution: 1 mg/mL of USP Levofloxacin RS in *Mobile phase*

Sample solution: 1 mg/mL of Levofloxacin in *Mobile phase*

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 360 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Column temperature: 45°

Flow rate: 0.8 mL/min

Injection size: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.5–1.5

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levofloxacin ($C_{18}H_{20}FN_3O_4$) in the portion of Levofloxacin taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of levofloxacin from the *Sample solution*

r_s = peak response of levofloxacin from the *Standard solution*

C_s = concentration of USP Levofloxacin RS in the *Standard solution* (mg/mL)

C_u = concentration of Levofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.2%. Use a platinum crucible.

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm • (Official 1-

Jan-2018)

- **ORGANIC IMPURITIES, PROCEDURE 1**

[NOTE—*Procedure 1* is recommended if levofloxacin *N*-oxide is a potential organic impurity. *Procedure 2* and *Procedure 3* are recommended if levofloxacin related compound B is a potential organic impurity.]

Solution A, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

System suitability solution: 1 mg/mL of USP Levofloxacin RS in *Mobile phase*

Sensitivity solution: 0.3 μg/mL of USP Levofloxacin RS in *Mobile phase*

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

Suitability requirements

Relative standard deviation: NMT 1.0%, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each individual impurity in the portion of Levofloxacin taken:

$$\text{Result} = (r_u/r_s) \times (1/F) \times 100$$

r_u = peak response of each impurity

r_s = peak response of levofloxacin

F = relative response factor (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

^c (S)-4-(6-Carboxy-9-fluoro-2,3-dihydro-3-methyl-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-10-yl)-1-methyl-piperazine-1-oxide.

^d (S)-2,3-Dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid.

^e (R)-9-Fluoro-2,3-dihydro-3-methyl-10-(4-methyl-1-piperazinyl)-7-oxo-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid.

* Do not include the D-isomer in the calculation for total impurities.

• ORGANIC IMPURITIES, PROCEDURE 2

[NOTE—Solutions of levofloxacin are not stable in light; use amber bottles.]

Buffer: Dissolve 3.08 g/L of ammonium acetate and 8.43 g/L of sodium perchlorate monohydrate in water. Adjust with phosphoric acid to a pH of 2.2.

Solution A: Acetonitrile and *Buffer* (16:84)

Solution B: Acetonitrile, methanol, and *Buffer* (30:20:50)

Solution C: 0.4 mg/mL of USP Levofloxacin RS by dissolving in acetonitrile at about 8% of volume and diluting with water to volume

Solution D: 0.05 mg/mL of USP Levofloxacin Related Compound A RS in 0.2% ammonium hydroxide in methanol

Mobile phase: See Table 2.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
10	82	18
15	40	60
30	40	60
30.1	100	0
38	100	0

System suitability solution: 0.1 mg/mL of USP Levofloxacin RS and 5 µg/mL of USP Levofloxacin Related Compound A RS in water from *Solution C* and *Solution D*

Levofloxacin stock solution: 0.4 mg/mL of USP Levofloxacin RS. Dissolve USP Levofloxacin RS in acetonitrile at about 8% of final volume, sonicate, and dilute with water to volume.

Levofloxacin standard solution: 0.02 mg/mL of USP Levofloxacin RS in acetonitrile and water (1:10) from *Levofloxacin stock solution*

Levofloxacin related compound B stock solution: 0.2 mg/mL USP Levofloxacin Related Compound B RS in methanol. [NOTE—Sonicate if necessary.]

Levofloxacin related compound B standard solution: 0.04 mg/mL USP Levofloxacin Related Compound B RS

in methanol from *Levofloxacin related compound B stock solution*

Standard solution: 0.4 µg/mL of levofloxacin and 0.8 µg/mL of levofloxacin related compound B in acetonitrile and water (1:10) from *Levofloxacin standard solution* and *Levofloxacin related compound B standard solution*

Sample solution: 0.4 mg/mL by dissolving the sample in acetonitrile at about 8% of final volume and diluting with water to volume. [NOTE—Sonicate if necessary.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 280 nm

Column: 4.0-mm × 15-cm; 3.0-µm packing L1

Column temperature: 38°

Flow rate: 1.0 mL/min

Injection size: 10 µL

System suitability

Sample: *System suitability solution*

Suitability requirements

Relative standard deviation: NMT 2.0% for levofloxacin

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levofloxacin related compound B in the portion of Levofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for levofloxacin related compound B from the *Sample solution*

r_S = peak response for levofloxacin related compound B from the *Standard solution*

C_S = concentration of USP Levofloxacin Related Compound B RS in the *Standard solution* (mg/mL)

C_U = concentration of Levofloxacin in the *Sample solution* (mg/mL)

Calculate the percentage of other impurities in the portion of Levofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other impurity from the *Sample solution*

r_S = peak response of levofloxacin from the *Standard solution*

C_S = concentration of USP Levofloxacin RS in the *standard solution* (mg/mL)

C_U = concentration of Levofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Levofloxacin related compound A (N-Desmethyl levofloxacin) ^a	0.9	0.20
Levofloxacin	1.0	—
Levofloxacin related compound B ^b	2.9	0.13

• ORGANIC IMPURITIES (ENANTIOMERIC PURITY), PROCEDURE 3

Buffer: 1.32 g/L of D-phenylalanine and 0.75 g/L of copper(II)sulfate pentahydrate in water

Mobile phase: Methanol and Buffer (15:85)

System suitability solution: 0.01 mg/mL of USP Ofloxacin RS and 0.01 mg/mL of USP Levofloxacin RS in water

Sample solution: 0.08 mg/mL in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: 294 nm

Column: 4.6-mm × 15-cm; 3.5-μm packing L1

Column temperature: 40°

Flow rate: 0.7 mL/min

Injection size: 10 μL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for D-ofloxacin and levofloxacin are 0.91 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between D-ofloxacin (D-isomer) and levofloxacin

Analysis

Sample: *Sample solution*

Calculate the percentage of D-ofloxacin in the portion of Levofloxacin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for D-ofloxacin

r_T = sum of responses of all peaks

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

• **OPTICAL ROTATION, Specific Rotation (781S)**

Solvent: Methanol

Sample solution: 5 mg/mL in Solvent

Acceptance criteria: −92° to −106°, at 20°

• **WATER DETERMINATION, Method 1a (921):** 2.0%–3.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at room temperature.

• **LABELING:** If a procedure for *Organic Impurities* other than *Procedure 1* is used, then the labeling states with which *Organic Impurities* procedure the article complies.

• **USP REFERENCE STANDARDS (11)**

USP Levofloxacin RS

USP Levofloxacin Related Compound A RS

USP Ofloxacin RS

Levofloxacin Oral Solution

DEFINITION

Levofloxacin Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

[NOTE—Protect the solutions of levofloxacin from light.]

Diluent: Acetonitrile and water (18:82)

Mobile phase: *Diluent* that contains 1 mL of trifluoroacetic acid in each 1000 mL of solution

Standard solution: 102.5 μg/mL of USP Levofloxacin RS in *Diluent*

System suitability solution: 102.5 μg/mL each of USP Levofloxacin RS and USP Levofloxacin Related Compound A RS in *Diluent*

Sample solution: 102.5 μg/mL of levofloxacin in *Diluent* based on the label claim. [NOTE—Mix the solution well after equilibrating the solution for 4 h at room temperature while protected from light.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 294 nm

Column: 4.6-mm × 15-cm; 3.5-μm packing L1

Column temperature: 30°

Flow rate: 0.7 mL/min

Run time: 2.5 times the retention time of the levofloxacin peak

Injection size: 20 μL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.9 between levofloxacin related compound A and levofloxacin, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Levofloxacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levofloxacin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Organic Impurities

• **PROCEDURE**

[NOTE—Protect the solutions of levofloxacin from light.]

Diluent, Mobile phase, Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each individual impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of levofloxacin from the *Standard solution*

C_S = concentration of USP Levofloxacin RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of levofloxacin in the *Sample solution* (mg/mL)

F = relative response factor for each impurity (See *Impurity Table 1*)

Acceptance criteria

Individual impurities: See Impurity Table 1.

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

Levofloxacin Tablets

DEFINITION

Levofloxacin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Diluent: Acetonitrile and water (20:80)**Mobile phase:** Transfer 874 mg of cupric sulfate, 918 mg of L-isoleucine, and 5.94 g of ammonium acetate to a suitable container. Add 700 mL of water, and mix until dissolved. Add 300 mL of methanol.**Standard stock solution:** 2 mg/mL of USP Levofloxacin RS in *Diluent***Standard solution:** 0.2 mg/mL of USP Levofloxacin RS in *Mobile phase* from the *Standard stock solution***Sample stock solution:** Nominally 5 mg/mL of levofloxacin prepared as follows. Transfer intact Tablets (NLT 5) to a volumetric flask, add 75% of the final volume of *Diluent*, and allow to stand for 15 min. Shake for 30 min, and dilute with *Diluent* to volume. Pass a portion of the solution through a suitable filter of 0.45- μ m pore size, discarding the first 1–2 mL of the filtrate.**Sample solution:** Nominally 0.2 mg/mL of levofloxacin in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC**Detector:** UV 360 nm**Column:** 4.6-mm \times 25-cm; 5- μ m packing L1**Column temperature:** 45°**Flow rate:** 0.8 mL/min**Injection volume:** 25 μ L**Run time:** 2 times the retention time of levofloxacin

System suitability

Sample: *Standard solution***Suitability requirements****Tailing factor:** NMT 1.8**Relative standard deviation:** NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response of levofloxacin from the *Sample solution* r_S = peak response of levofloxacin from the *Standard solution* C_S = concentration of USP Levofloxacin RS in the *Standard solution* (mg/mL) C_U = nominal concentration of levofloxacin in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL**Apparatus 2:** 75 rpm**Time:** 30 min**Standard solution:** 0.56 mg/mL of USP Levofloxacin RS in *Medium***Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV**Analytical wavelength:** 294 nm**Cell length:** 0.1 mm**Blank:** *Medium*

Analysis

Samples: *Standard solution* and *Sample solution*Calculate the percentage (Q) of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$) dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times V \times D \times (1/L) \times 100$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)
 V = volume of *Medium*, 900 mL
 D = dilution factor of the *Sample solution*
 L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$) is dissolved.

Test 2

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: L/900 mg/mL of USP Levofloxacin RS in *Medium*, and mix to obtain solutions with known concentrations as indicated in *Table 1*, where L is the label claim in mg/Tablet.

Sample solution: Pass a portion of the solution under test having a concentration similar to that of the *Standard solution* through a suitable filter of 0.45- μ m pore size.

Table 1

Tablet Label Claim (mg)	Final Concentration (mg/mL)
250	0.27
500	0.55
750	0.83

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)
 V = volume of *Medium*, 900 mL
 D = dilution factor of the *Sample solution*
 L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of levofloxacin ($C_{18}H_{20}FN_3O_4$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES• **ORGANIC IMPURITIES**

Diluent, Mobile phase, Standard stock solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.2 mg/mL of USP Levofloxacin RS from the *Standard stock solution* and 1 μ g/mL of USP Levofloxacin Related Compound A RS in *Mobile phase*

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8 for the levofloxacin peak

Relative standard deviation: NMT 2.0% for the levofloxacin peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of levofloxacin related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of levofloxacin related compound A from the *Sample solution*

- r_s = peak response of levofloxacin related compound A from the *Standard solution*
 C_s = concentration of USP Levofloxacin Related Compound A RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of levofloxacin in the *Sample solution* (mg/mL)
 Calculate the percentage of any other impurities in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

- r_u = peak response of any impurity from the *Sample solution*
 r_s = peak response of levofloxacin from the *Standard solution*
 C_s = concentration of USP Levofloxacin RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of levofloxacin in the *Sample solution* (mg/mL)
 F = relative response factor (see Table 2)
 Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

- USP REFERENCE STANDARDS (11)**
 USP Levofloxacin RS
 USP Levofloxacin Related Compound A RS
 (S)-9-Fluoro-3-methyl-10-(piperazin-1-yl)-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de][1,4]benzoxazine-6-carboxylic acid.
 $C_{17}H_{18}FN_3O_4$ 347.34

Levonordefrin

$C_9H_{13}NO_3$ 183.20
 1,2-Benzenediol, 4-(2-amino-1-hydroxypropyl)-, [*R*-(*R**,*S**)]-(-)- α -(1-Aminoethyl)-3,4-dihydroxybenzyl alcohol
 [18829-78-2; 829-74-3].

» Levonordefrin, dried in vacuum at 60° for 15 hours, contains not less than 98.0 percent and not more than 102.0 percent of $C_9H_{13}NO_3$.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Levonordefrin RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 25 μ g per mL.

Medium: 0.1 N hydrochloric acid.

Specific rotation (781S): between -28° and -31°.

Test solution: 50 mg, previously dried, per mL, in 0.3 N hydrochloric acid.

Loss on drying (731)—Dry it in vacuum at 60° for 15 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.2%.

Chromatographic purity—

Standard solutions—Dissolve an accurately weighed quantity of USP Levonordefrin RS in a mixture of methanol and glacial acetic acid (96:4) to obtain a Standard stock solution having a known concentration of 5 mg per mL. Dilute this solution quantitatively with a mixture of methanol and glacial acetic acid (96:4) to obtain *Standard solutions*, designated below by letter, having the following compositions:

Standard solution	Dilution	Concentration (μ g RS per mL)	Percentage (% for comparison with test specimen)
A	(1 in 10)	500	1.0
B	(1 in 20)	250	0.5
C	(1 in 50)	100	0.2
D	(1 in 100)	50	0.1

Test solution—Dissolve an accurately weighed quantity of Levonordefrin in a mixture of methanol and glacial acetic acid (96:4) to obtain a solution containing 50 mg per mL.

Procedure—Apply separately 5 μ L of the *Test solution* and 5 μ L of each *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of *n*-butyl alcohol, water, and glacial acetic acid.

(70:20:10) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm, circulating air. Examine the plate under short-wavelength UV light. Expose the plate to iodine vapors, and examine again. Compare the intensities, observed by both visualizations, of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*: the sum of the intensities of secondary spots obtained from the *Test solution* corresponds to not more than 1.0% of related compounds, with no single impurity corresponding to more than 0.5%.

Assay—Transfer about 350 mg of Levonorgestrel, previously dried and accurately weighed, to a small flask, dissolve in 50 mL of glacial acetic acid, heating, if necessary, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 18.32 mg of $C_{21}H_{28}O_2$.

Levonorgestrel

$C_{21}H_{28}O_2$ 312.45

18,19-Dinorpregn-4-en-20-yn-3-one, 13-ethyl-17-hydroxy-, (17 α)-(-)-

(-)-13-Ethyl-17-hydroxy-18,19-dinor-17 α -pregn-4-en-20-yn-3-one [797-63-7].

» Levonorgestrel contains not less than 98.0 percent and not more than 102.0 percent of $C_{21}H_{28}O_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Levonorgestrel RS

Identification—

A: *Infrared Absorption* (197K).

B: Meeting the requirements of the tests for *Specific rotation* and *Melting range* provides identification distinguishing it from norgestrel.

Melting range (741): between 232° and 239°, but the range between beginning and end of melting does not exceed 4°.

Specific rotation (781S): between -30° and -35°.

Test solution: 20 mg per mL, in chloroform.

Loss on drying (731)—Dry it at 105° for 5 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.3%.

Limit of ethynyl group—Dissolve 200 mg in about 40 mL of tetrahydrofuran. Add 10 mL of silver nitrate solution (1 in 10), and titrate with 0.1 N sodium hydroxide VS, using either a glass-calomel or a silver-silver chloride electrode system with potassium nitrate filling solution. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium hydroxide is equivalent to 2.503 mg of ethynyl group ($-C\equiv CH$). Not less than 7.81% and not more than 8.18% of ethynyl group is found.

Chromatographic purity—Proceed as directed in the test for *Chromatographic purity* under *Norgestrel*, using USP Levo-

norgestrel RS in place of USP Norgestrel RS. The requirements of the test are met if the sum of the impurities in the *Test preparation* does not exceed 2.0% and no single impurity is greater than 0.5%.

Assay—Using USP Levonorgestrel RS, proceed as directed in the *Assay* under *Norgestrel*, except to read "Levonorgestrel" in place of "Norgestrel."

Levonorgestrel and Ethinyl Estradiol Tablets

DEFINITION

Levonorgestrel and Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of levonorgestrel ($C_{21}H_{28}O_2$) and NLT 90.0% and NMT 110.0% of the labeled amount of ethinyl estradiol ($C_{20}H_{24}O_2$).

IDENTIFICATION

- A. The retention times of the two major peaks of the *Sample solution* correspond to those of levonorgestrel and ethinyl estradiol in the *Standard solution*, as obtained in the *Assay*.
 - B. Finely powder 20 Tablets and transfer a portion of the powder, equivalent to 4 mg of levonorgestrel, to a suitable container. Add 250 mL of a solvent mixture consisting of isooctane and chloroform (3:1). Sonicate the mixture for 3 min, and then stir it by mechanical means for 30 min. Filter the mixture and evaporate the filtrate to dryness in a rotating vacuum evaporator. Dissolve the residue in 3 mL of chloroform, and transfer with a pipet to a 60-mL separator containing 18 mL of isooctane. Rinse the evaporator flask with an additional 3-mL portion of chloroform, and add the rinsing to the separator. Add 10 mL of 1 N sodium hydroxide, shake vigorously, and allow the layers to separate. Discard the lower aqueous phase, and filter the organic phase through 3 g of anhydrous sodium sulfate on filter paper into a 50-mL beaker. Rinse the filter with several small portions of the mixture of isooctane and chloroform (3:1), adding the filtered rinsings to the filtrate, and evaporate under nitrogen on a steam bath to dryness. Dissolve the residue in 1–2 mL of hot toluene, and transfer with a pipet to a small glass vial. Reduce the volume of the solution to 0.1 mL under nitrogen with warming. [NOTE—During this step, any crystals that deposit on the vial wall should be transferred to the bottom, and allowed to redissolve.] Store the vial containing the clear toluene solution at 4° overnight to allow crystallization to occur. Remove and discard the mother liquor with a pipet, rinse the crystals with two 0.5-mL portions of anhydrous ether, and discard the rinsings. Dry the vial containing the rinsed crystals in a vacuum desiccator at 60° for 4 h.
- Acceptance criteria:** The melting point of the dried crystals of levonorgestrel so obtained is not lower than 220°, using the procedure described under *Melting Range or Temperature* (741), *Class I*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile, methanol, and water (35:15:45)

Standard solution: 15 μ g/mL of USP Levonorgestrel RS and 3 μ g/mL of USP Ethinyl Estradiol RS in *Mobile phase*

Sample solution: Transfer a number of Tablets, equivalent to 3 mg of levonorgestrel, to a 200-mL volumetric flask. Dilute with *Mobile phase* to volume, sonicate to disintegrate the Tablets, then shake by mechanical means for 20 min. Centrifuge, and use the clear supernatant.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5- to 7-μm packing L7

Flow rate: 1 mL/min

Injection size: 50 μL

System suitabilitySample: *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol and levonorgestrel are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between the two major peaks

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of C₂₁H₂₈O₂ and C₂₀H₂₄O₂ in the portion of Tablets taken:

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

Sample solution: Place 1 Tablet in a 40-mL centrifuge tube, add 10.0 mL of *Mobile phase*, and proceed as directed in the *Assay*.**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**

USP Ethinyl Estradiol RS

USP Levonorgestrel RS

Levorphanol TartrateC₁₇H₂₃NO · C₄H₆O₆ · 2H₂O 443.49

Morphinan-3-ol, 17-methyl-, [R-(R*,R*)]-2,3-dihydroxybutanedioate (1:1) (salt), dihydrate.

17-Methylmorphinan-3-ol, tartrate (1:1) (salt) dihydrate [5985-38-6].

Anhydrous 407.47 [125-72-4].

» Levorphanol Tartrate contains not less than 99.0 percent and not more than 101.0 percent of C₁₇H₂₃NO · C₄H₆O₆, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)

USP Levorphanol Tartrate RS

Identification

A: Infrared Absorption (197K)—Obtain the test specimen as follows. Dissolve 50 mg in 25 mL of water in a 125-mL separator. Add 2 mL of 6 N ammonium hydroxide, extract with 25 mL of chloroform, and filter the chloroform extract through a layer of 4 g of granular anhydrous sodium sulfate supported on glass wool into a 125-mL conical flask. Evaporate the chloroform extract on a steam bath with the aid of

a stream of nitrogen to dryness. Dissolve the residue in 1 mL of acetone, and evaporate to dryness. Dry in vacuum at 90° for 1 hour. Proceed as directed with the dried levorphanol so obtained and a similar preparation of USP Levorphanol Tartrate RS.

B: Ultraviolet Absorption (197U)—

Solution: 130 µg per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivities at 279 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

Specific rotation (781S): between -14.7° and -16.3°.

Test solution: 30 mg per mL, in water. Heat on a water bath or sonicate to dissolve 750 mg in 20 mL of water in a 25-mL volumetric flask, dilute with water to volume, and mix.

Water Determination, Method I (921): between 7.0% and 9.0%.

Residue on ignition (281): not more than 0.1%.

Ordinary impurities (466)—

Test solution: water.

Standard solution: water.

Eluent: a mixture of hexanes, dehydrated alcohol, and ammonium hydroxide (80:25:1).

Visualization: 17; then view immediately under short-wavelength UV light.

Assay—Dissolve about 900 mg of sample, accurately weighed, in 85 mL of glacial acetic acid, warming slightly if necessary. Titrate with 0.1 N perchloric acid VS and determine the endpoint potentiometrically. Perform a blank determination and make any necessary corrections. Each mL of 0.1 N perchloric acid consumed by the sample is equivalent to 40.75 mg of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$.

Levorphanol Tartrate Injection

» Levorphanol Tartrate Injection is a sterile solution of Levorphanol Tartrate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

Identification—

A: To 1 mL of Injection add 1 drop of 3 N hydrochloric acid and 2 drops of ferric chloride TS. Heat to boiling, and add 1 mL of potassium ferricyanide solution (1 in 200): a blue-green color develops.

B: The angular rotation of the Injection is levorotatory (see *Optical Rotation* (781)).

Bacterial Endotoxins Test (85)—It contains not more than 125.0 USP Endotoxin Units per mg of levorphanol tartrate.

pH (791): between 4.1 and 4.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Transfer an accurately measured volume of Injection, equivalent to about 40 mg of levorphanol tartrate, to a 125-mL separator. Add 5 g of sodium chloride and sufficient sodium bicarbonate to render the solution alkaline to litmus, add an additional 100 mg of sodium bicarbonate, and extract the levorphanol with five 20-mL portions of a mixture

of 3 volumes of ether and 1 volume of chloroform. Pass the combined extracts through a layer of about 10 g of granular anhydrous sodium sulfate into a 500-mL conical flask, and evaporate to a volume of about 30 mL. Add about 50 mL of chloroform and 1 drop of methanolic methyl red TS, and titrate with 0.01 N perchloric acid in dioxane VS to a red endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.01 N perchloric acid is equivalent to 4.435 mg of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$.

Levorphanol Tartrate Tablets

» Levorphanol Tartrate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of levorphanol tartrate ($C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Levorphanol Tartrate RS

Identification—

A: Powder finely a number of Tablets. To a portion of the powder, equivalent to about 1 mg of levorphanol tartrate, add 1 mL of water, 1 drop of 3 N hydrochloric acid, and 2 drops of ferric chloride TS, and heat to boiling. To the hot solution add 1 mL of potassium ferricyanide solution (1 in 200): a bluish color develops.

B: Powder a number of Tablets, equivalent to about 60 mg of levorphanol tartrate, and transfer the mixture to a small separator. Add 10 mL of water, dissolve as much of the powder as possible, add about 400 mg of sodium bicarbonate, and extract with a 50-mL portion of chloroform. Evaporate the filtered chloroform extract on a steam bath to a small volume, dilute with chloroform to 10 mL, and determine the angular rotation: the solution is levorotatory (see *Optical Rotation* (781)).

Dissolution (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 279 nm on filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentration of USP Levorphanol Tartrate RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Transfer 1 Tablet to a glass-stoppered flask, add 25.0 mL of 0.1 N hydrochloric acid, and allow the Tablet to disintegrate. Shake well, and filter through a small filter paper, discarding the first portion of the filtrate. Dilute a portion of the filtrate quantitatively and stepwise, if necessary, to provide a solution containing about 80 µg of levorphanol tartrate per mL. Concomitantly determine the absorbances of this solution and of a solution of USP Levorphanol Tartrate RS in the same medium having a known concentration of about 80 µg of anhydrous levorphanol tartrate per mL, in 1-cm cells at the wavelength of maximum absorbance at about 279 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the

blank. Calculate the quantity, in mg, of $C_{17}H_{23}NO \cdot C_4H_6O_6 \cdot 2H_2O$ in the Tablet taken by the formula:

$$(443.49 / 407.47)(TC / D)(A_U / A_S)$$

in which 443.49 and 407.47 are the molecular weights of the hydrated and anhydrous forms of levorphanol tartrate, respectively; T is the labeled quantity, in mg, of levorphanol tartrate in the Tablet; C is the concentration, in μg per mL, of USP Levorphanol Tartrate RS, on the anhydrous basis, in the Standard solution; D is the concentration, in μg per mL, of levorphanol tartrate in the solution from the Tablet, based on the labeled quantity per Tablet and the extent of dilution; and A_U and A_S are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 40 mg of levorphanol tartrate, transfer to a 125-mL separator, add 20 mL of water and sufficient sodium bicarbonate to render the suspension alkaline to litmus, and proceed as directed in the Assay under *Levorphanol Tartrate Injection*, beginning with "add an additional 100 mg of sodium bicarbonate."

Levothyroxine Sodium

$C_{15}H_{10}I_4NNaO_4 \cdot xH_2O$ (anhydrous) 798.85
L-Tyrosine, O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-, monosodium salt, hydrate;
Monosodium L-thyroxine hydrate [25416-65-3].
Anhydrous [55-03-8].

DEFINITION

Levothyroxine Sodium is the sodium salt of L-3,3',5,5'-tetraiodothyronine. It contains NLT 97.0% and NMT 103.0% of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197): [NOTE—Methods described in *Infrared Absorption* (197K) or (197A) may be used.]
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.
- **C. IDENTIFICATION TESTS—GENERAL, Sodium** (191)
Sample solution: To 200 mg add 2 mL of 2 N sulfuric acid. Heat on a water bath and then carefully heat over an open flame, increasing the temperature gradually up to about 600°. [NOTE—Alternative procedures for igniting the material could also be used.] Continue the ignition until most of the particles have disappeared. Dissolve the residue in 2 mL of water.
Acceptance criteria: The *Sample solution* meets the requirements of the pyroantimonate precipitation test.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and water (4:6) that contains 0.5 mL of phosphoric acid in each 1000 mL

Solution A: 400 mg of sodium hydroxide in 500 mL of water. Cool and add 500 mL of methanol.

Levothyroxine stock solution: 0.4 mg/mL of USP Levothyroxine RS in *Solution A*

Liothyronine stock solution: 0.4 mg/mL of liothyronine from USP Liothyronine RS in *Solution A*. Make a 1:100 dilution of this solution using *Mobile phase*.

Standard solution: 10 μg /mL of levothyroxine from *Levothyroxine stock solution* and 0.2 μg /mL of liothyronine from *Liothyronine stock solution* in *Mobile phase*

Sample solution: 10 μg /mL of Levothyroxine Sodium in *Mobile phase*. [NOTE—A small amount of 0.01 M methanolic sodium hydroxide can be used to facilitate the dissolution of the sample.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm \times 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection volume: 100 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between liothyronine and levothyroxine

Relative standard deviation: NMT 2.0% for levothyroxine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$) in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of levothyroxine from the *Sample solution*

r_S = peak response of levothyroxine from the *Standard solution*

C_S = concentration of USP Levothyroxine RS in the *Standard solution* ($\mu\text{g}/\text{mL}$)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* ($\mu\text{g}/\text{mL}$)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

Acceptance criteria: 97.0%–103.0% on the anhydrous basis

IMPURITIES

[NOTE—On the basis of the synthetic route, perform either *Organic Impurities, Procedure 1* or *Organic Impurities, Procedure 2*. *Procedure 2* is recommended when related compounds listed in *Table 3* may be present.]

• ORGANIC IMPURITIES, PROCEDURE 1

Diluent: Acetonitrile and water (1:1)

Solution A: Dilute 5 mL of phosphoric acid with *Diluent* to 100.0 mL.

Mobile phase: Dissolve 1.0 g of sodium 1-heptanesulfonate in 200 mL of water. Add 200 mL of acetonitrile, 400 mL of methanol, and 1.0 mL of phosphoric acid. Dilute with water to 1 L.

Standard stock solution 1: Transfer 25 mg of USP Levothyroxine RS to a 100-mL volumetric flask. Add 50 mL of *Diluent* and 1 drop of 10 N sodium hydroxide, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Standard stock solution 2: Transfer 25 mg of USP Liothyronine RS to a 100-mL volumetric flask. Add 50 mL of *Diluent* and 1 drop of 10 N sodium hydroxide, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

System suitability solution: Transfer 5.0 mL of *Standard stock solution 1* and 5.0 mL of *Standard stock solution 2* to a 100-mL volumetric flask. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Standard solution: Pipet 4.0 mL of the *System suitability solution* into a 100-mL volumetric flask. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Sample solution: Transfer 25 mg of Levothyroxine Sodium to a 100-mL volumetric flask. Add 50 mL of *Diluent*, and sonicate until dissolved. Add 7 mL of *Solution A*, and dilute with *Diluent* to volume.

Blank solution: Transfer 7 mL of *Solution A* to a 100-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection volume: 15 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between levothyroxine and liothyronine, *System suitability solution*

Relative standard deviation: NMT 2.0% for the levothyroxine peak, *Standard solution*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank solution*

[NOTE—Record the chromatograms for at least six times the retention time of the levothyroxine peak. Verify that no peaks elute in the *Blank solution* at the expected retention times for levothyroxine and related compounds.]

Calculate the area percentage of each related compound in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of levothyroxine from the *Standard solution*

C_S = concentration of USP Levothyroxine RS in the *Standard solution* (mg/mL)

C_U = concentration of Levothyroxine Sodium in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

[NOTE—The relative response factor for the impurities listed in *Table 1* is 1.00. Any unspecified impurity peaks should be assigned a relative response factor of 1.00.]

Disregard peaks corresponding to those of the *Blank solution*, and disregard peaks corresponding to less than 0.03%.

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Liothyronine	0.65–0.70	1.0
β-Hydroxy-T4 ^a	0.71–0.76	0.15

^a O-(4-Hydroxy-3,5-diiodophenyl)-3,5-diiodo-β-hydroxy-L-tyrosine.

^b 2-Hydroxy-2-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetic acid.

^c N-Formyl-O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosine.

^d 2-[4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetamide.

^e N-Acetyl-O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosine.

^f 2-[4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetic acid.

^g 4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodobenzaldehyde.

^h 4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodobenzoic acid.

Table 1 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Levothyroxine	1.0	—
T4-Hydroxyacetic acid ^b	1.13–1.28	0.15

Total impurities	—	2.0

^a O-(4-Hydroxy-3,5-diiodophenyl)-3,5-diiodo-β-hydroxy-L-tyrosine.

^b 2-Hydroxy-2-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetic acid.

^c N-Formyl-O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosine.

^d 2-[4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetamide.

^e N-Acetyl-O-(4-hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosine.

^f 2-[4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]acetic acid.

^g 4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodobenzaldehyde.

^h 4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodobenzoic acid.

• ORGANIC IMPURITIES, PROCEDURE 2

Solution A: Dissolve 9.7 g of sulfamic acid in 2000 mL of water. Add 1.5 g of sodium hydroxide, mix to dissolve, and adjust with 2 N sodium hydroxide to a pH of 2.0.

Solution B: Acetonitrile

Diluent 1: Methanol and *Solution A* (90:10)

Diluent 2: Acetonitrile and *Solution A* (30:70); mix with *Diluent 1* (1:1).

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	70	30
10	70	30
40	20	80
50	20	80
53	70	30
75	70	30

Identification solution: Dissolve 5.0 mg of USP Levothyroxine for Peak Identification RS in 4.5 mL of methanol. Add 0.5 mL of *Solution A*. Further dilute a portion of this solution with *Diluent 2* to obtain a solution containing about 0.2 mg/mL.

Standard stock solution: 0.1 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS in *Diluent 1*

Standard solution: 0.002 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS, prepared using the *Standard stock solution* in *Diluent 2*

Sensitivity solution: 0.0002 mg/mL each of USP Levothyroxine RS and USP Liothyronine RS, prepared using the *Standard solution* in *Diluent 2*

Sample solution: Dissolve an amount of Levothyroxine Sodium in *Diluent 1* to obtain a solution with a known concentration of about 1.0 mg/mL. Further dilute a portion of this solution with *Diluent 2* to obtain a solution with a known concentration of about 0.2 mg/mL.

Blank solution: Use Diluent 2.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 225 nm

Column: 4.0-mm × 15-cm; 3-μm packing L1

Flow rate: 1.0 mL/min

Injection volume: 25 μL

System suitability

Samples: Standard solution and Sensitivity solution

Suitability requirements

Resolution: NLT 5 between levothyroxine and liothyronine, Standard solution

Signal-to-noise ratio: NLT 5 for each peak from the Sensitivity solution, calculated as follows:

$$\text{Result} = (2H)/h$$

H = measured height of the peak

h = amplitude of the average measured baseline noise

Analysis

Samples: Blank solution, Standard solution, Identification solution, and Sample solution

[NOTE—Identify the components on the basis of their relative retention times as listed in Table 3.]

Calculate the percentage of liothyronine sodium in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of liothyronine from the Sample solution

r_S = peak response of liothyronine from the Standard solution

C_S = concentration of USP Liothyronine RS in the Standard solution (mg/mL)

C_U = concentration of Levothyroxine Sodium in the Sample solution (mg/mL)

M_{r1} = molecular weight of liothyronine sodium, 672.96

M_{r2} = molecular weight of liothyronine, 650.98
Calculate the percentage of any other impurity in the portion of Levothyroxine Sodium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of any impurity from the Sample solution

r_S = peak response of levothyroxine from the Standard solution

C_S = concentration of USP Levothyroxine RS in the Standard solution (mg/mL)

C_U = concentration of Levothyroxine Sodium in the Sample solution (mg/mL)

M_{r1} = molecular weight of levothyroxine sodium, 798.85

M_{r2} = molecular weight of levothyroxine, 776.87

[NOTE—The relative response factor for the impurities listed in Table 3 is 1.00. Any unspecified impurity peaks should be assigned a relative response factor of 1.00.]

Disregard peaks corresponding to those of the Blank solution, and disregard peaks corresponding to less than 0.03%.

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Liothyronine	0.65	1.0
Monochlorotriiodothyronine ^a	0.94	0.15
Levothyroxine N-methylamide ^b	0.97	0.15
Levothyroxine	1.0	—
Triiodothyroacetic acid, or T3-acetic acid ^c	1.57	0.15
O-(4-Hydroxy-3,5-diiodophenyl)thyroxine, or T6 ^d	1.61	0.50
O-Methyl-tetraiodothyroethylamine, or T4-amine O-methyl ^e	1.76	0.30
T4-Acetic acid ^f	1.79	0.30
Individual unspecified impurity	—	0.10
Total impurities	—	2.0

^a (S)-2-Amino-3-[3-chloro-4-(4-hydroxy-3,5-diiodophenoxy)-5-iodophenyl]-propanoic acid.

^b (S)-2-Amino-3-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl]-N-methylpropanamide.

^c [4-(4-Hydroxy-3-iodophenoxy)-3,5-diiodophenyl]acetic acid.

^d (S)-2-Amino-3-[4-[4-(4-hydroxy-3,5-diiodophenoxy)-3,5-diiodophenoxy]-3,5-diiodophenyl]propanoic acid.

^e 2-[4-(3,5-Diiodo-4-methoxyphenoxy)-3,5-diiodophenyl]ethanamine.

^f 2-(4-(4-Hydroxy-3,5-diiodophenoxy)-3,5-diiodophenyl)acetic acid.

SPECIFIC TESTS

• OPTICAL ROTATION, Specific Rotation (781S)

Sample solution: Equivalent to 30 mg/mL of anhydrous Levothyroxine Sodium in alcohol and 1 N sodium hydroxide (2:1)

Acceptance criteria: -5° to -6°

• WATER DETERMINATION, Method I (921): NMT 11.0%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers, protected from light. Store as stated in the labeling instructions.

• LABELING: If a test for Organic Impurities other than Procedure 1 is used, the labeling states the test with which the article complies.

• USP REFERENCE STANDARDS (11)

USP Levothyroxine RS

O-(4-Hydroxy-3,5-diiodophenyl)-3,5-diiodo-L-tyrosine.

$C_{15}H_{11}I_4NO_4$ 776.87

USP Levothyroxine for Peak Identification RS

Levothyroxine sodium spiked with liothyronine, triiodothyroacetic acid, and tetraiodothyroacetic acid.

USP Levothyroxine Sodium RS

USP Liothyronine RS

O-(4-Hydroxy-3-iodophenyl)-3,5-diiodo-L-tyrosine.

$C_{15}H_{12}I_3NO_4$ 650.98

Levothyroxine Sodium Oral Powder

» Levothyroxine Sodium Oral Powder contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Levothyroxine RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Loss on drying (731)—Dry it in vacuum at 60° for 3 hours; it loses not more than 2.0% of its weight.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65:35) that contains 1 mL of phosphoric acid in each 1000 mL. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

0.01 M Methanolic sodium hydroxide—Dissolve 400 mg of sodium hydroxide in 500 mL of water. Cool, add 500 mL of methanol, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Levothyroxine RS in 0.01 M Methanolic sodium hydroxide, and dilute quantitatively and stepwise with 0.01 M Methanolic sodium hydroxide to obtain a solution having a known concentration of about 4 µg per mL.

Assay preparation—Transfer an accurately weighed portion of Oral Powder, equivalent to about 5 mg of levothyroxine sodium, to a 250-mL volumetric flask. Dilute with 0.01 M Methanolic sodium hydroxide to volume, mix, and allow to stand for 4 hours, with occasional mixing. Pass a portion of this mixture through a filter that does not absorb levothyroxine. Transfer 10.0 mL of the filtrate to a 50-mL volumetric flask, dilute with 0.01 M Methanolic sodium hydroxide to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$) in the portion of Oral Powder taken by the formula:

$$(798.85 / 776.87)(1.25C)(r_U / r_S)$$

in which 798.85 and 776.87 are the molecular weights of levothyroxine sodium and levothyroxine, respectively; C is the concentration, in µg per mL, of USP Levothyroxine RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Levothyroxine Sodium Tablets

DEFINITION

Levothyroxine Sodium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$).

IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to the levothyroxine peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

[NOTE—Use *Sample solution 2* for Tablets labeled to meet the requirements of *Dissolution Test 3*. For all other products, use the *Sample solution*.]

Mobile phase: Mixture of acetonitrile and water (4:6) containing 0.5 mL of phosphoric acid in each L of the mixture

Solution A: Dissolve 400 mg of sodium hydroxide in 500 mL of water. Cool, and add 500 mL of methanol.

Diluent: Mixture of methanol and water (6:4), containing 0.5 mL of phosphoric acid in each L of the mixture

Levothyroxine stock solution: 0.4 mg/mL of USP Levothyroxine RS in *Solution A*

Liothyronine stock solution: 0.4 mg/mL of USP Liothyronine RS in *Solution A*. Make a 1:100 dilution of this solution using *Mobile phase*.

Standard solution: 10 µg/mL of levothyroxine from *Levothyroxine stock solution* and 0.2 µg/mL of liothyronine from *Liothyronine stock solution*, in *Mobile phase*

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to about 100 µg of levothyroxine sodium, to a centrifuge tube, add 2 glass beads, pipet 10 mL of *Mobile phase* into the tube, and mix on a vortex mixer for 3 min. Centrifuge to obtain a clear supernatant, filtering if necessary.

Sample solution 2 (For Tablets labeled to meet the requirements of Dissolution Test 3): Place the appropriate number of Tablets (see *Table 1* below) into a suitable container, add 100.0 mL of *Diluent*, and shake by mechanical means for at least 30 min, or until the Tablets are fully disintegrated. Pass through a PTFE filter of 0.45-µm pore size.

Table 1

Tablet Strength (µg/Tablet of Levothyroxine Sodium)	Number of Tablets
Less than 100	20
At least 100 but less than 200	15
200 or more	10

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection size: 100 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between liothyronine and levothyroxine

Relative standard deviation: NMT 2.0% for the levothyroxine peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{15}H_{10}I_4NNaO_4$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response from the *Sample solution*
- r_S = peak response from the *Standard solution*
- C_S = concentration of USP Levothyroxine RS in the *Standard solution* (µg/mL)
- C_U = nominal concentration of levothyroxine sodium in the *Sample solution* (µg/mL)
- M_{r1} = molecular weight of levothyroxine sodium, 798.85
- M_{r2} = molecular weight of levothyroxine, 776.87
- Acceptance criteria**: 95.0%–105.0%

PERFORMANCE TESTS

DISSOLUTION (711)

[NOTE—All containers that are in contact with solutions containing levothyroxine sodium are to be made of glass.]

Test 1

Medium: 0.01 N hydrochloric acid containing 0.2% sodium lauryl sulfate; 500 mL

Apparatus 2: 50 rpm

Time: 45 min

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by using the following method.

Mobile phase: Methanol and 0.1% phosphoric acid (6:4)

Standard stock solution: 0.1 mg/mL of USP Levothyroxine RS in methanol

Standard solution: Dilute the *Standard stock solution* with *Medium* to obtain a solution having a concentration similar to that expected in the *Sample solution*.

Sample solution: Pass a portion of the solution under test through a suitable filter. [NOTE—Before use, check the filters for absorptive loss of drug.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 2 mL/min

Injection size: 800 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 4.0% of levothyroxine

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances: NLT 70% (Q) of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium, Apparatus, Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed for *Test 1*.

Time: 15 min

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus, Time, Standard solution, and

Sample solution: Proceed as directed in *Test 1*.

[NOTE—Filter the *Standard solution* in a manner identical to the *Sample solution*.]

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by employing the following method.

Mobile phase: Acetonitrile and water (35:65) that contains 0.5 mL/L of phosphoric acid

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L10

Temperature: 30°

Flow rate: 1.5 mL/min

Injection size: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

[NOTE—Do not use paddle stirrers with synthetic coating.]

Medium: 0.01 N hydrochloric acid; 500 mL for Tablets labeled to contain between 25 and 175 μ g of levothyroxine sodium; and 900 mL for Tablets labeled to contain 200 or 300 μ g of levothyroxine sodium

Apparatus 2: 75 rpm

Time: 45 min

Determine the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved by using the following method.

Mobile phase: Acetonitrile, water, and phosphoric acid, (500:700:2)

Standard stock solution: Transfer about 100 mg of USP Levothyroxine RS to a 100-mL volumetric flask. Add 80 mL of alcohol and 1 mL of 1 N hydrochloric acid, sonicate for 2 min, dilute with alcohol to volume, and mix.

Standard solution: Dilute the *Standard stock solution* with a mixture of alcohol and water (1:1) to obtain a solution having a concentration of 0.01 mg/mL of levothyroxine. Dilute the resulting solution with *Medium* to obtain a final concentration similar to that expected in the *Sample solution*.

Sample solution: Sample per *Dissolution* (711). Centrifuge the solution under analysis.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.0-mm × 12.5-cm; packing L7

Flow rate: 1.5 mL/min

Injection size: 500 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 4.0% of levothyroxine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the amount of $C_{15}H_{10}I_4NNaO_4$ dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of $C_{15}H_{10}I_4NNaO_4$ is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES**Organic Impurities**

- **PROCEDURE: LIMIT OF LIOTHYRONINE SODIUM**

[NOTE—Use *Sample solution 2* for Tablets labeled to meet the requirements of *Dissolution Test 3*. For all other products, use the *Sample solution*.]

Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis: Calculate the percentage of $C_{15}H_{11}I_3NNaO_4$ in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of liothyronine from the *Sample solution*

r_S = peak response of liothyronine from the *Standard solution*

C_S = concentration of USP Liothyronine RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of levothyroxine sodium in the *Sample solution* (μ g/mL)

M_{r1} = molecular weight of liothyronine sodium, 672.96

M_{r2} = molecular weight of liothyronine, 650.98

Acceptance criteria: NMT 2.0% of liothyronine sodium

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**

Lidocaine

$C_{14}H_{22}N_2O$ 234.34
Acetamide, 2-(diethylamino)-N-(2,6-dimethylphenyl)-;
2-(Diethylamino)-2',6'-acetoxydide [137-58-6].

DEFINITION

Lidocaine contains NLT 97.5% and NMT 102.5% of $C_{14}H_{22}N_2O$.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K):** Previously dried in vacuum over silica gel for 24 h
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**PROCEDURE**

Solution A: Water and glacial acetic acid (930:50). Adjust with 1 N sodium hydroxide to a pH of 3.40.

Mobile phase: Acetonitrile and *Solution A* (1:4), so that the retention time of lidocaine is 4–6 min

Standard solution: Dissolve 85 mg of USP Lidocaine RS, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a 50-mL volumetric flask. Dilute with *Mobile phase* to volume.

System suitability stock solution: 220 µg/mL of methylparaben in *Mobile phase*

System suitability solution: Mix 2 mL of *System suitability stock solution* and 20 mL of *Standard solution*.

Sample solution: Dissolve 85 mg of Lidocaine, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a 50-mL volumetric flask. Dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection size: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between lidocaine and methylparaben, *System suitability solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of $C_{14}H_{22}N_2O$ in the portion of Lidocaine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)
 C_U = concentration of Lidocaine in the *Sample solution* (mg/mL)

Acceptance criteria: 97.5%–102.5%

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride (221):** Dissolve 1.0 g in a mixture of 3 mL of 2 N nitric acid and 12 mL of water, and add 1 mL of silver nitrate TS: the turbidity does not exceed that produced by 50 µL of 0.020 N hydrochloric acid (0.0035%).
- **CHLORIDE AND SULFATE, Sulfate (221):** Dissolve 100 mg in a mixture of 1 mL of 2 N nitric acid and 10 mL of water. Filter if necessary, and add 1 mL of barium chloride TS. The turbidity does not exceed that produced by 0.10 mL of 0.020 N sulfuric acid (NMT 0.1%).

Delete the following:

- **HEAVY METALS, Method I (231)**

Test preparation: 1.0 g

Analysis: Dissolve the *Test preparation* in a mixture of 2 mL of 3 N hydrochloric acid and 10 mL of water.

Evaporate on a steam bath to dryness, and dissolve the residue in 25 mL of water.

Acceptance criteria: 20 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE (741):** 66°–69°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Lidocaine RS

Lidocaine Topical Aerosol**DEFINITION**

Lidocaine Topical Aerosol is a solution of Lidocaine in a suitable flavored vehicle with suitable propellants in a pressurized container equipped with a metering valve. It contains NLT 90.0% and NMT 110.0% of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$), and it delivers NLT 85.0% and NMT 115.0% of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$) per actuation.

IDENTIFICATION**A.**

Sample solution: To 5 mL of Aerosol spray, collected in a separator, add 10 mL of water and 3 mL of dilute hydrochloric acid (1 in 2), wash with two 15-mL portions of chloroform, and discard the chloroform washings. Render the solution in the separator alkaline with 5–6 mL of ammonium hydroxide, and extract with three 20-mL portions of chloroform, filtering the chloroform extracts through a pledget of cotton previously moistened with chloroform. Evaporate the combined chloroform extracts with the aid of gentle heat to dryness, and dry the residue under vacuum over silica gel for 24 h.

Acceptance criteria: A potassium bromide dispersion of the lidocaine exhibits maxima only at the same wavelengths as that of a similar preparation of USP Lidocaine RS.

- **B.**
Analysis: To 2 mL of Aerosol spray, collected in a test tube, add 10–15 drops of cobaltous chloride TS, and shake for 2 min.
Acceptance criteria: A bright green color develops, and a fine precipitate is formed (lidocaine).
- **C.**
Analysis: To 2 mL of Aerosol spray, collected in a test tube, add 5 mL of water, 1 mL of 2 N nitric acid, and 3 mL of mercuric nitrate TS.
Acceptance criteria: A light yellow color develops (lidocaine).

ASSAY• **PROCEDURE**

Sample solution: Weigh 1 Aerosol container and actuator. Transfer a counted number of NLT 10 doses to a 125-mL conical flask by carefully discharging the doses in such a manner as to avoid loss of material, and take precautions to protect the sample from absorption of atmospheric moisture. Weigh the container and actuator to obtain the sample weight. To the specimen, add 20 mL of chloroform, mix, and add 10 mL of dioxane and 2 drops of crystal violet TS.

Analysis: Titrate with 0.1 N perchloric acid in dioxane VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 23.43 mg of lidocaine ($C_{14}H_{22}N_2O$).

Acceptance criteria: It contains 90.0%–110.0% of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$), and it delivers 85.0%–115.0% of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$) per actuation.

PERFORMANCE TESTS**Change to read:**

- **INHALATION AND NASAL DRUG PRODUCTS: AEROSOLS, SPRAYS, AND POWDERS—PERFORMANCE QUALITY TESTS (601) and TOPICAL AEROSOLS (603)** (CN 1-May-2017)
For Delivered-Dose Uniformity and Number of Discharges per Container
Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in nonreactive aerosol containers equipped with metered-dose valves.
- **USP REFERENCE STANDARDS (11)**
 USP Lidocaine RS

Lidocaine Ointment**DEFINITION**

Lidocaine Ointment is Lidocaine in a suitable hydrophilic ointment base. It contains NLT 95.0% and NMT 105.0% of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$).

IDENTIFICATION• **A. INFRARED ABSORPTION (197K)**

Sample: Stir a quantity of Ointment, equivalent to 300 mg of lidocaine, with 20 mL of water, transfer to a

separator, and extract with two 30-mL portions of solvent hexane. Wash the combined hexane extracts with 10 mL of water, evaporate with the aid of a current of warm air, and dry the residue in vacuum over silica gel for 24 h.

Acceptance criteria: The crystalline precipitate so obtained meets the requirements.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 0.1% phosphoric acid, prepared by adding 1.0 mL of 85% phosphoric acid to 1 L of water

Solution B: Acetonitrile

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
10	10	90
10.1	90	10
15	90	10

Diluent: Acetonitrile and *Solution A* (1:1)

System suitability solution: 0.1 mg/mL of USP Lidocaine RS and 0.04 mg/mL of USP Ropivacaine Related Compound A RS in *Diluent*

[NOTE—USP Ropivacaine Related Compound A RS is 2,6-dimethylaniline hydrochloride.]

Standard solution: 0.1 mg/mL of USP Lidocaine RS in *Diluent*

Sample solution: Nominally 0.1 mg/mL of lidocaine in *Diluent* from a portion of Ointment. Sonicate the solution for about 5 min.

Chromatographic system

(See *Chromatography (621)*, *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Flow rate: 0.8 mL/min

Injection volume: 5 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for 2,6-dimethylaniline and lidocaine are about 0.93 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 1.5 for the lidocaine peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Resolution: NLT 1.8 between lidocaine and 2,6-dimethylaniline, *System suitability solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lidocaine ($C_{14}H_{22}N_2O$) in the portion of Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
- r_S = peak response from the *Standard solution*
- C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)
- C_U = nominal concentration of lidocaine in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

Lidocaine Hydrochloride Injection

» Lidocaine Hydrochloride Injection is a sterile solution of Lidocaine Hydrochloride in Water for Injection, or a sterile solution prepared from Lidocaine with the aid of Hydrochloric Acid in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass. Injection may be packaged in 50-mL multiple-dose containers.

Labeling—Injections that are of such concentration that they are not intended for direct injection into tissues are labeled to indicate that they are to be diluted prior to administration.

USP Reference standards (11)—

USP Endotoxin RS

USP Lidocaine RS

Identification—Place in a separator a volume of Injection equivalent to about 300 mg of lidocaine hydrochloride, and extract with four 15-mL portions of chloroform, discarding the chloroform extracts. Add 2 mL of 2 N sodium hydroxide to the aqueous solution remaining in the separator, and extract with four 15-mL portions of chloroform. Combine the chloroform extracts, and evaporate with the aid of a current of warm air to dryness. Dissolve the crystals so obtained in solvent hexane, evaporate with the aid of warm air, and dry the residue in vacuum over silica gel for 24 hours: the residue so obtained responds to *Identification test A* under *Lidocaine*.

Bacterial Endotoxins Test (85)—It contains not more than 1.1 USP Endotoxin Units per mg of lidocaine hydrochloride.

pH (791): between 5.0 and 7.0.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay—Proceed with Injection as directed in the Assay for lidocaine hydrochloride under Lidocaine Hydrochloride and Epi-nephine Injection.

Lidocaine Hydrochloride Jelly

DEFINITION

Lidocaine Hydrochloride Jelly is Lidocaine Hydrochloride in a suitable, water-soluble, sterile, viscous base. It contains NLT 95.0% and NMT 105.0% of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Standard: Prepare as directed in *Infrared Absorption* (197K), using USP Lidocaine RS.

Sample: Place in a separator containing 10–15 mL of water a quantity of Jelly, equivalent to 300 mg of lidocaine hydrochloride. Mix to assure thorough dilution of the Jelly, and add 4 mL of 6 N ammonium hydroxide. Extract with four 15-mL portions of chloroform. Combine the chloroform extracts, and evaporate with the aid of a current of warm air to dryness. Redissolve the crystals in solvent hexane, evaporate with the aid of warm air, and dry the residue in vacuum over silica gel for 24 h.

Acceptance criteria: The residue so obtained meets the requirements.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 0.1% phosphoric acid, prepared by adding 1.0 mL of 85% phosphoric acid to 1 L of water

Solution B: Acetonitrile

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) in the portion of Oral Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of lidocaine from the *Sample solution*

r_S = peak response of lidocaine from the *Standard solution*

C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of lidocaine hydrochloride, 270.80

M_{r2} = molecular weight of lidocaine, 234.34

Acceptance criteria: 95.0%–105.0%

RS, and 0.00065 mg/mL of USP Ropivacaine Related Compound A RS in *Mobile phase*

Sample solution: Nominally equivalent to 5 mg/mL of lidocaine hydrochloride in *Mobile phase*

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between lidocaine related compound H and ropivacaine related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0% for lidocaine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lidocaine related compound H in the portion of Oral Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lidocaine related compound H from the *Sample solution*

r_S = peak response of lidocaine related compound H from the *Standard solution*

C_S = concentration of USP Lidocaine Related Compound H RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of dimethylaniline in the portion of Oral Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of dimethylaniline from the *Sample solution*

r_S = peak response of dimethylaniline from the *Standard solution*

C_S = concentration of USP Ropivacaine Related Compound A RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lidocaine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of ropivacaine related compound A, 157.64

M_{r2} = molecular weight of dimethylaniline, 121.18

Calculate the percentage of any other individual impurity in the portion of Oral Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of lidocaine from the *Standard solution*

C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of lidocaine hydrochloride, 270.80

M_{r2} = molecular weight of lidocaine, 234.34

Acceptance criteria: See *Table 1*. Disregard any impurity peak less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lidocaine related compound H	0.33	0.1
Dimethylaniline	0.37	0.01

IMPURITIES**• ORGANIC IMPURITIES**

Solution A, Mobile phase, System suitability solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution: 0.0043 mg/mL of USP Lidocaine RS, 0.005 mg/mL of USP Lidocaine Related Compound H

Total impurities	—	—

SPECIFIC TESTS

- **pH** (791): 5.0–7.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
 - USP Lidocaine RS
 - USP Lidocaine Related Compound H RS
 - N-(Chloroacetyl)-2,6-xylidide.
 - $C_{10}H_{12}ClNO$ 197.66
 - USP Ropivacaine Related Compound A RS
 - 2,6-Dimethylaniline hydrochloride.
 - $C_8H_{11}N \cdot HCl$ 157.64

Lidocaine Hydrochloride Topical Solution

DEFINITION

Lidocaine Hydrochloride Topical Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Sample: Place in a separator a volume of Topical Solution, equivalent to 200 mg of lidocaine hydrochloride, and extract with four 15-mL portions of chloroform, discarding the chloroform extracts. Add 2 mL of 2 N sodium hydroxide to the aqueous solution remaining in the separator, and extract with four 15-mL portions of chloroform. Combine the chloroform extracts, and evaporate with the aid of a current of warm air to dryness. Dissolve the crystals in solvent hexane, evaporate with the aid of warm air, and dry the residue under vacuum over silica gel for 24 h.

Acceptance criteria: The residue obtained from the *Sample* meets the requirements.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

- **PROCEDURE**

Solution A: Glacial acetic acid and water (5:93). Adjust with 1 N sodium hydroxide to a pH of 3.40.

Mobile phase: Acetonitrile and *Solution A* (1:4)

Standard solution: 1.7 mg/mL of USP Lidocaine RS (equivalent to 2 mg/mL of lidocaine hydrochloride) in *Mobile phase* prepared as follows. Transfer a weighed quantity of USP Lidocaine RS to a suitable volumetric flask, and add 1 N hydrochloric acid to fill 1% of the final volume. Warm if necessary, and dilute with *Mobile phase* to volume.

System suitability stock solution: 220 µg/mL of USP Methylparaben RS in *Mobile phase*

System suitability solution: Mix 2 mL of the *System suitability stock solution* with 20 mL of the *Standard solution*.

Sample solution: Nominally equivalent to 2 mg/mL of lidocaine hydrochloride from Topical Solution in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between lidocaine and methylparaben, *System suitability solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of lidocaine from the *Sample solution*

r_S = peak response of lidocaine from the *Standard solution*

C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of lidocaine hydrochloride, 270.80

M_{r2} = molecular weight of lidocaine, 234.34

Acceptance criteria: 95.0%–105.0%

IMPURITIES

- **ORGANIC IMPURITIES**

Solution A and Mobile phase: Proceed as directed in the Assay.

System suitability solution: 2.6 µg/mL of USP Lidocaine RS, 3.9 µg/mL of USP Ropivacaine Related Compound A RS, and 3 µg/mL of USP Lidocaine Related Compound H RS in *Mobile phase*

Standard solution: 0.0017 mg/mL of USP Lidocaine RS, 0.0026 mg/mL of USP Ropivacaine Related Compound A RS (equivalent to 0.002 mg/mL of 2,6-dimethylaniline), and 0.002 mg/mL of USP Lidocaine Related Compound H RS in *Mobile phase*

Sample solution: Nominally equivalent to 2 mg/mL of lidocaine hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.5 mL/min

Injection volume: 50 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 1 for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between lidocaine related compound H and ropivacaine related compound A, *System suitability solution*

Relative standard deviation: NMT 2.0% for lidocaine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of lidocaine related compound H in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of lidocaine related compound H from the *Sample solution*
 r_S = peak response of lidocaine related compound H from the *Standard solution*
 C_S = concentration of USP Lidocaine Related Compound H RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of dimethylaniline in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of dimethylaniline from the *Sample solution*
 r_S = peak response of dimethylaniline from the *Standard solution*
 C_S = concentration of USP Ropivacaine Related Compound A RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of ropivacaine related compound A, 157.64
 M_{r2} = molecular weight of dimethylaniline, 121.84
 Calculate the percentage of any impurity in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of lidocaine from the *Standard solution*
 C_S = concentration of USP Lidocaine RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of lidocaine hydrochloride in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of lidocaine hydrochloride, 270.80
 M_{r2} = molecular weight of lidocaine, 234.34

Acceptance criteria: See *Table 1*. Disregard any impurity peak less than 0.05%.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lidocaine	1.0	—
Dimethylaniline	3.2	0.1
Lidocaine related compound H	3.8	0.1

Table 1 (Continued)

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Any unspecified impurity	—	0.10
Total impurities	—	2.0

SPECIFIC TESTS

- pH (791):** 5.0–7.0

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
 - USP Lidocaine RS
 - USP Lidocaine Related Compound H RS
 - N-(Chloroacetyl)-2,6-xylylidide.
 - $C_{10}H_{12}ClNO$ 197.66
 - USP Methylparaben RS
 - USP Ropivacaine Related Compound A RS
 - 2,6-Dimethylaniline hydrochloride.
 - $C_8H_{11}N \cdot HCl$ 157.64

Lidocaine Hydrochloride and Dextrose Injection

» Lidocaine Hydrochloride and Dextrose Injection is a sterile solution of Lidocaine Hydrochloride and Dextrose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) and dextrose ($C_6H_{12}O_6 \cdot H_2O$).

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

USP Reference standards (11)—

- USP Endotoxin RS
- USP Lidocaine RS

Identification—

A: Place in a separator a volume of Injection equivalent to about 300 mg of lidocaine hydrochloride, add 2 mL of 2 N sodium hydroxide, and extract with four 15-mL portions of chloroform. Combine the chloroform extracts, and evaporate with the aid of a current of warm air to dryness. Dissolve the crystals so obtained in solvent hexane, evaporate with the aid of warm air, and dry the residue in vacuum over silica gel for 24 hours; the residue so obtained responds to *Identification test A* under *Lidocaine*.

B: It responds to the *Identification test* under *Dextrose*.

Bacterial Endotoxins Test (85)—It contains not more than 1.1 USP Endotoxin Units per mg of lidocaine hydrochloride.

pH (791): between 3.0 and 7.0.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay for lidocaine hydrochloride—Proceed with Injection as directed in the *Assay for lidocaine hydrochloride* under *Lidocaine and Epinephrine Injection*.

Assay for dextrose—Determine the angular rotation of Injection in a suitable polarimeter tube (see *Optical Rotation (781)*). Calculate the percentage (g per 100 mL) of dextrose

($C_6H_{12}O_6 \cdot H_2O$) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively; A is 100 mm divided by the length of the polarimeter tube, in mm; and R is the observed rotation, in degrees.

Lidocaine Hydrochloride and Epinephrine Injection

» Lidocaine Hydrochloride and Epinephrine Injection is a sterile solution prepared from Lidocaine Hydrochloride and Epinephrine with the aid of Hydrochloric Acid in Water for Injection, or a sterile solution prepared from Lidocaine and Epinephrine with the aid of Hydrochloric Acid in Water for Injection, or a sterile solution of Lidocaine Hydrochloride and Epinephrine Bitartrate in Water for Injection. The content of epinephrine does not exceed 0.002 percent (1 in 50,000). Lidocaine Hydrochloride and Epinephrine Injection contains the equivalent of not less than 95.0 percent and not more than 105.0 percent of the labeled amount of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) and the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of epinephrine ($C_9H_{13}NO_3$).

Packaging and storage—Preserve in single-dose or multiple-dose light-resistant containers, preferably of Type I glass.

Labeling—The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

USP Reference standards (11)—

USP Endotoxin RS

USP Epinephrine Bitartrate RS

USP Lidocaine RS

Color and clarity—Using the Injection as the *Test solution*, proceed as directed for *Color and clarity* under *Epinephrine Injection*.

Bacterial Endotoxins Test (85)—It contains not more than 0.7 USP Endotoxin Unit per mg of lidocaine hydrochloride.

pH (791): between 3.3 and 5.5.

Other requirements—It responds to the *Identification* test under *Lidocaine Hydrochloride Injection*. It meets also the requirements under *Injections and Implanted Drug Products* (1).

Assay for lidocaine hydrochloride—

Mobile phase—Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40. Mix about 4 volumes of this solution with 1 volume of acetonitrile, so that the retention time of lidocaine is about 4 to 6 minutes. Pass through a membrane filter having a 1- μ m or finer porosity, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve about 85 mg of USP Lidocaine RS, accurately weighed, with warming if necessary, in 0.5 mL of 1 N hydrochloric acid in a 50-mL volumetric flask,

dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 1.7 mg of lidocaine per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of lidocaine hydrochloride, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Resolution preparation—Prepare a solution of methylparaben in *Mobile phase* containing about 220 μ g per mL. Mix 2 mL of this solution and 20 mL of the *Standard preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph about 20 μ L of the *Resolution preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between lidocaine and methylparaben is not less than 3.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Assay preparation* and the *Standard preparation* into the chromatograph. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of lidocaine hydrochloride ($C_{14}H_{22}N_2O \cdot HCl$) in each mL of the Injection taken by the formula:

$$(270.80/234.34)(50)(C/V)(r_U/r_S)$$

in which 270.80 and 234.34 are the molecular weights of lidocaine hydrochloride and lidocaine, respectively; C is the concentration, in mg per mL, of USP Lidocaine RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and r_U and r_S are the lidocaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Assay for epinephrine—

Mobile phase—Mix 50 mL of glacial acetic acid and 930 mL of water, and adjust with 1 N sodium hydroxide to a pH of 3.40. Dissolve 1.1 g of sodium 1-heptanesulfonate in this solution, add 1.0 mL of 0.1 M edetate disodium, and mix. Mix about 9 volumes of this solution with 1 volume of methanol, so that the retention time of epinephrine is about 4 to 6 minutes. Pass through a membrane filter having a 1- μ m or finer porosity, and degas.

Standard preparation—Dissolve an accurately weighed quantity of USP Epinephrine Bitartrate RS in *Mobile phase* to obtain a solution having a known concentration of about 9 μ g of epinephrine bitartrate per mL. Pipet 10 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 1.8 μ g of epinephrine bitartrate per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 50 μ g of epinephrine, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is fitted with a 3.9-mm \times 30-cm stainless steel column that contains packing L1 and is equipped with an electrochemical detector held at a potential of +650 mV, a controller capable of regulating the background current, and a suitable recorder. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative standard deviation of the peak responses of successive injections of the *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Assay preparation* and the *Standard preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters so that satisfactory chromatography and

peak responses are obtained. Record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μg , of epinephrine ($\text{C}_9\text{H}_{13}\text{NO}_3$) in each mL of the Injection taken by the formula:

$$(183.20/333.29)(50)(C/V)(r_U/r_S)$$

in which 183.20 and 333.29 are the molecular weights of epinephrine and epinephrine bitartrate, respectively; C is the concentration, in μg per mL, of USP Epinephrine Bitartrate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lidocaine and Prilocaine Cream

» Lidocaine and Prilocaine Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of lidocaine ($\text{C}_{14}\text{H}_{22}\text{N}_2\text{O}$) and prilocaine ($\text{C}_{13}\text{H}_{20}\text{N}_2\text{O}$).

Packaging and storage—Preserve in collapsible tubes or in tight containers. Do not store above 30° . Do not freeze.

USP Reference standards (11)—

USP Lidocaine RS

USP Prilocaine Hydrochloride RS

USP Prilocaine Related Compound B RS

(RS)-N-(4-Methylphenyl)-2-(propylamino)propanamide.
 $\text{C}_{13}\text{H}_{20}\text{N}_2\text{O}$ 220.31

Identification—The retention times of the major peaks in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*. The total aerobic microbial count does not exceed 100 cfu per g, and the total combined molds and yeasts count does not exceed 50 cfu per g.

Minimum fill (755): meets the requirements.

pH (791): between 8.7 and 9.7, determined in a solution (1 in 10) or in the undiluted Cream.

Related compounds—

Solution A, *Solution B*, *Mobile phase*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay*.

Standard solution—Dissolve accurately weighed quantities of USP Lidocaine RS and USP Prilocaine Hydrochloride RS in *Solution A*, and dilute quantitatively, and stepwise if necessary, with *Solution A* to obtain a solution having a known concentration of about 0.002 mg per mL of each compound. Immediately store this solution at or below 10° .

Test solution—Use the *Assay preparation*, prepared as directed in the *Assay*.

Chromatographic system (see Chromatography (621))—Proceed as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are listed in *Table 1*; and the resolution, R , between prilocaine and prilocaine related compound B is not less than 1.4. Chromatograph the *Standard solution* a minimum of six times, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 50 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each related compound in the portion of the Cream taken by the formula:

$$100C(r_U/r_S)(V/W)(100/L)(1/F)(220.31/256.77)$$

in which C is the individual concentration, in mg per mL, of either USP Lidocaine RS or USP Prilocaine Hydrochloride RS in the *Standard solution*; r_U is the individual peak response of the impurities obtained from the *Test solution*; r_S is the individual peak response for either lidocaine or prilocaine obtained from the *Standard solution*; V is the volume, in mL, of the *Test solution*; W is the weight, in mg, of the Cream taken to prepare the *Test solution*; L is the individual label claim, in percent, for either lidocaine or prilocaine; F is the relative response factor for each related compound as listed in *Table 1*; and 220.31 and 256.77 are the molecular weights of prilocaine and prilocaine hydrochloride, respectively (these are used only for calculation involving prilocaine related compounds). The percentages of lidocaine related compounds and prilocaine related compounds are calculated using the concentration and peak response from USP Lidocaine RS and USP Prilocaine Hydrochloride RS, respectively. The designation of whether an impurity is a lidocaine related compound or prilocaine related compound is specified in *Table 1*. The percentage of any individual unknown related compound is determined using the concentration and peak response from USP Prilocaine Hydrochloride RS in the *Standard solution*.

Table 1

Related Compound	Relative Retention Time ^a	Relative Response Factor (F)	Limit
o-Toluidine	0.38	2.3 (P) ^b	not more than 2.0%
n-Chloroacetyl-2,6-xyldine	0.54	1.0 (L) ^c	not more than 0.1%
2,6-Dimethylaniline	0.67	3.3 (L) ^c	not more than 0.1%
Prilocaine	1.00	—	—
2-Diethylaminoaceto-2,4-xyldine	1.33	0.8 (L) ^c	not more than 0.1%
Lidocaine	2.14	—	—
n-Dichloroacetyl-2,6-xyldine	2.98	2.2 (L) ^c	not more than 0.1%
Any other individual related compounds	—	1.0 (P) ^b	not more than 0.2%
Total related compounds, excluding o-toluidine	—	—	not more than 1.0%

^a Relative to the prilocaine peak.

^b P designates a prilocaine related compound.

^c L designates a lidocaine related compound.

Assay—

Solution A—Dissolve about 2.73 g of monobasic potassium phosphate in 630 mL of water, and adjust with 5 N sodium hydroxide to a pH of 7.20 ± 0.02 . Dilute with acetonitrile to 1 L.

Solution B—Dissolve about 2.73 g of monobasic potassium phosphate in 900 mL of water, and adjust with 5 N sodium hydroxide to a pH of 7.20 ± 0.02 . Dilute with acetonitrile to 1 L.

Mobile phase—Use variable mixtures of filtered and degassed **Solution A** and **Solution B** as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

Standard preparation—Dissolve accurately weighed quantities of USP Lidocaine RS and USP Prilocaine Hydrochloride RS in **Solution A**, and dilute quantitatively, and stepwise if necessary, with **Solution A** to obtain a solution having a known concentration of about 0.2 mg per mL of each compound. Immediately store this solution at or below 10°.

System suitability solution—Dissolve an accurately weighed quantity of USP Prilocaine Related Compound B RS in the **Standard preparation**, and dilute quantitatively, and stepwise if necessary, with the **Standard preparation**, to obtain a solution having a known concentration of about 0.08 mg per mL of prilocaine related compound B.

Assay preparation—Transfer a portion of the Cream, equivalent to about 20 mg each of lidocaine and prilocaine, accurately weighed, to a 100-mL volumetric flask. Add 5 mL of 5 N sodium hydroxide to disperse the Cream, and mix. Add 5 mL of 5 N hydrochloric acid, and dilute with **Solution A** to volume, and mix. Pass a portion through a nylon filter having a 0.2-μm or finer porosity, discarding the first 1 mL, and use the filtrate. Immediately store this solution at or below 10°.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm × 10-cm column that contains 3-μm packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. The samples are maintained at or below 10°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	67	33	equilibration
0–11.0	67	33	isocratic
11.0–22.0	67→100	33→0	linear gradient
22.0–32.0	100	0	isocratic

Chromatograph the **System suitability solution**, and record the peak responses as directed for *Procedure*: the relative retention times are 1.00 for prilocaine, 1.09 for prilocaine related compound B, and 2.14 for lidocaine; and the resolution, R , between prilocaine and prilocaine related compound B is not less than 1.4. Chromatograph the **Standard preparation** a minimum of five times, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates, based on the prilocaine peak; the tailing factor is not more than 1.5, based on the prilocaine peak; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μL) of the **Standard preparation** and the **Assay preparation** into the chromatograph, record the chromatograms, and measure the responses for the lidocaine and prilocaine peaks. Calculate the percentage of the label claim of lidocaine

($C_{14}H_{22}N_2O$) and prilocaine ($C_{13}H_{20}N_2O$) in the portion of Cream taken by the formula:

$$100C(r_U / r_S)(V/W)(100/L)(220.31/256.77)$$

in which C is the individual concentration, in mg per mL, of either USP Lidocaine RS or USP Prilocaine Hydrochloride RS in the **Standard preparation**; r_U and r_S are either the individual peak responses of lidocaine or prilocaine obtained from the **Assay preparation** and the **Standard preparation**, respectively; V is the volume, in mL, of the **Assay preparation**; W is the weight, in mg, of the Cream taken to prepare the **Assay preparation**; L is the individual label claim, in percent, for either lidocaine or prilocaine; and 220.31 and 256.77 are the molecular weights of prilocaine and prilocaine hydrochloride, respectively (these are used only for calculating the percentage of prilocaine in the Cream).

Lime

CaO 56.08

Calcium oxide [1305-78-8].

DEFINITION

Lime, when freshly ignited to constant weight, contains NLT 95.0% of lime (CaO).

IDENTIFICATION

- **A.** **Analysis:** Moisten a suitable quantity of Lime with water: heat is generated, and a white powder is obtained (calcium hydroxide or slaked lime). Mix the powder with 3 or 4 times its weight of water.
Acceptance criteria: A smooth magma of lime forms that is alkaline to litmus.
- **B. IDENTIFICATION TESTS—GENERAL, Calcium (191)**
Sample solution: Slake 1 g with 20 mL of water, and add 6 N acetic acid until the lime is dissolved.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Sample solution: Ignite 1 g of Lime in a muffle furnace to constant weight. Cool, weigh accurately, and dissolve in 20 mL of 3 N hydrochloric acid. Cool the solution, transfer to a 500-mL volumetric flask with the aid of water, and dilute with water to volume.
Analysis: Transfer 50.0 mL to a suitable container, add 100 mL of water, 15 mL of 1 N sodium hydroxide, and 300 mg of hydroxy naphthol blue. Titrate with 0.05 M edetate disodium VS until the solution is deep blue in color. Each mL of 0.05 M edetate disodium is equivalent to 2.804 mg of lime (CaO).
Acceptance criteria: NLT 95.0%

IMPURITIES

- **INSOLUBLE SUBSTANCES**
Sample: 5.0 g
Analysis: Slake the **Sample**, then mix with 100 mL of water, followed by hydrochloric acid, dropwise, with agitation, until solution takes place: the resulting solution after boiling and cooling is acid. Filter the solution through a tared crucible, wash with water until free of chlorides, and dry at 105° for 1 h.
Acceptance criteria: NMT 50 mg (1.0%) of insoluble substances
- **MAGNESIUM AND ALKALI SALTS**
Sample solution: Dissolve 500 mg in 30 mL of water and 15 mL of 3 N hydrochloric acid. Neutralize the solution with 6 N ammonium hydroxide, heat to boiling, and add ammonium oxalate TS to precipitate the cal-

cium completely. Heat the mixture on a steam bath for 1 h. Cool, dilute with water to 100 mL, mix, and filter.

Analysis: To 50 mL of the filtrate add 0.5 mL of sulfuric acid, evaporate to dryness, and ignite in a tared platinum crucible to constant weight.

Acceptance criteria: The weight of the residue does not exceed 9 mg.

• **CARBONATE**

Sample: 1 g

Analysis: Slake the *Sample*, mix with 50 mL of water, and decant the greater portion of the milky liquid.

Acceptance criteria: The addition of an excess of 3 N hydrochloric acid to the residue does not cause more than a slight effervescence.

SPECIFIC TESTS

• **LOSS ON IGNITION** (733)

Analysis: Ignite a portion to constant weight in a tared platinum crucible at $1100 \pm 50^\circ$.

Acceptance criteria: NMT 10.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

Lincomycin Injection

» Lincomycin Injection contains an amount of Lincomycin Hydrochloride in Water for Injection equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$). It contains benzyl alcohol as a preservative.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Lincomycin Hydrochloride RS

Bacterial Endotoxins Test (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of lincomycin.

Sterility Tests (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

pH (791): between 3.0 and 5.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

*Mobile phase, Standard preparation, and Chromatographic system—*Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*.

*Assay preparation—*Transfer an accurately measured volume of Injection, equivalent to about 600 mg of lincomycin, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure—*Proceed as directed for *Procedure* in the *Assay* under *Lincomycin Hydrochloride*. Calculate the quantity, in mg, of lincomycin ($C_{18}H_{34}N_2O_6S$) in each mL of the Injection taken by the formula:

$$0.625(CP/V)(r_U/r_S)$$

in which *V* is the volume, in mL, of Injection taken, and the other terms are as defined therein.

Lincomycin Oral Solution

» Lincomycin Oral Solution contains an amount of lincomycin hydrochloride ($C_{18}H_{34}N_2O_6S \cdot HCl \cdot H_2O$) equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$), and one or more suitable colors, flavors, preservatives, and sweeteners in water.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Lincomycin Hydrochloride RS

Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 3 and 5.5.

Assay—

*Mobile phase, Standard preparation, and Chromatographic system—*Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*.

*Assay preparation—*Transfer an accurately measured volume of Oral Solution, freshly mixed and free of air bubbles, equivalent to about 100 mg of lincomycin, to a suitable container. Add 0.5 mL of sodium carbonate solution (3 in 10), and swirl for 30 seconds, noting that a precipitate forms. Add 1.0 mL of 0.2 N sodium hydroxide, swirl for 30 seconds, add 10.0 mL of chloroform, and shake by mechanical means for 10 minutes. Centrifuge, and remove the upper aqueous layer by suction. Transfer 1.0 mL of the clear chloroform layer to a suitable container, and evaporate under a stream of nitrogen to dryness. Add 10.0 mL of *Mobile phase* to the residue, and dissolve by swirling, sonicating if necessary.

*Procedure—*Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*, recording the chromatogram over a period seven times the retention time of lincomycin. Calculate the quantity, in mg, of lincomycin ($C_{18}H_{34}N_2O_6S$) in each mL of the Oral Solution taken by the formula:

$$(CP/10V)(r_U/r_S)$$

in which *V* is the volume, in mL, of Oral Solution taken; and the other terms are as defined therein.

Lincomycin Hydrochloride

$C_{18}H_{34}N_2O_6S \cdot HCl \cdot H_2O$ 461.01

D-erythro- α -D-galacto-Octopyranoside, methyl 6,8-dideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-, monohydrochloride, monohydrate, (2S-trans)-.

Methyl 6,8-dideoxy-6-(1-methyl-trans-4-propyl-L-2-pyrrolidinecarboxamido)-1-thio-D-erythro- α -D-galacto-octopyranoside monohydrochloride monohydrate [7179-49-9].

Anhydrous 443.01 [859-18-7].

» Lincomycin Hydrochloride has a potency equivalent to not less than 790 μg of lincomycin ($\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$) per mg.

Packaging and storage—Preserve in tight containers.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Endotoxin RS

USP Lincomycin Hydrochloride RS

Identification, Infrared Absorption (197M).

Specific rotation (781S): between $+135^\circ$ and $+150^\circ$.

Test solution: 20 mg per mL, in water.

Crystallinity (695): meets the requirements.

pH (791): between 3.0 and 5.5, in a solution (1 in 10).

Water Determination, Method I (921): between 3.0% and 6.0%.

Limit of lincomycin B—Use the chromatogram obtained from the *Assay preparation* in the *Assay*: the area of the lincomycin B peak is not greater than 5.0% of the sum of the areas of the lincomycin B peak and the lincomycin peak.

Other requirements—Where the label states that Lincomycin Hydrochloride is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Lincomycin Injection*. Where the label states that Lincomycin Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Lincomycin Injection*.

Assay—

Mobile phase—Add 13.5 mL of phosphoric acid to 1000 mL of water, and adjust with ammonium hydroxide to a pH of 6.0. Prepare a filtered and degassed mixture of this solution, acetonitrile, and methanol (780:150:150). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Lincomycin Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 1.2 mg per mL, using sonication if necessary to effect solution.

Assay preparation—To about 12 mg of Lincomycin Hydrochloride, accurately weighed, add 10.0 mL of *Mobile phase*. Shake by mechanical means for 5 minutes, and sonicate if necessary to effect solution.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm \times 25-cm column that contains 5- μm packing L7 and is maintained at a temperature of 46° . The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the main lincomycin peak is not more than 1.3; the column efficiency determined from the main lincomycin peak is not less than 4000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The relative retention times are about 0.5 for lincomycin B and 1.0 for lincomycin. Calculate the quantity, in μg , of lincomycin ($\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$) in each mg of the Lincomycin Hydrochloride taken by the formula:

$$10(CP / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Lincomycin Hydrochloride RS in the *Standard preparation*; P

is the designated potency, in μg of lincomycin per mg, of USP Lincomycin Hydrochloride RS; W is the weight, in mg, of the portion of Lincomycin Hydrochloride taken to prepare the *Assay preparation*; and r_U and r_S are the lincomycin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lincomycin Hydrochloride Capsules

» Lincomycin Hydrochloride Capsules contain an amount of $\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S} \cdot \text{HCl} \cdot \text{H}_2\text{O}$ equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of lincomycin ($\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Lincomycin Hydrochloride RS

Dissolution (711)—

Medium: water; 500 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Filter a portion of about 20 mL of the solution under test. Transfer about 5 mL of the eluant into a small test tube, and add 250 μL of 0.01 M sodium sulfate internal standard solution. Evaporate until dry using a vacuum centrifuge. Add 10.0 μL of water to the precipitate and place on a vortex mixer until all solid material is dissolved. Transfer this solution to a capillary tube, place it in a Raman spectrometer, and obtain the Raman spectrum using suitable instrumental conditions. Integrate the Raman intensity, applying baseline corrections, between 660 cm^{-1} and 720 cm^{-1} . Divide this result by the integrated intensity between 966 cm^{-1} and 994 cm^{-1} . Determine the amount of $\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$ dissolved in comparison with an aqueous *Standard solution* having a known concentration of USP Lincomycin Hydrochloride RS.

Tolerances—Not less than 75% (Q) of the labeled amount of $\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 7.0%.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*.

Assay preparation—Remove, as completely as possible, the contents of not less than 10 Capsules, taking care to prevent capsule shell fragments from being combined with the capsule contents and to remove any shell fragments from the contents. Weigh and mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of lincomycin, to a suitable container. Add 50.0 mL of *Mobile phase*, and shake by mechanical means for 5 minutes. Use the solution thus obtained as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Lincomycin Hydrochloride*. Calculate the quantity, in mg, of lincomycin ($\text{C}_{18}\text{H}_{34}\text{N}_2\text{O}_6\text{S}$) in the portion of Capsule contents taken by the formula:

$$(CP / 20)(r_U / r_S)$$

in which the terms are as defined therein.

Lincomycin Hydrochloride Soluble Powder

» Lincomycin Hydrochloride Soluble Powder contains an amount of Lincomycin Hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lincomycin ($C_{18}H_{34}N_2O_6S$).

Packaging and storage—Preserve in tight containers.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Lincomycin Hydrochloride RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Minimum fill (755): meets the requirements.

Water Determination, Method I (921): not more than 6.0%.

Assay—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*.

Standard preparation—Dissolve an accurately weighed quantity of USP Lincomycin Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 1.2 mg per mL.

Assay preparation—Remove as completely as possible the contents of not fewer than 5 containers. Weigh and mix the combined contents, and transfer an accurately weighed portion of the Soluble Powder, equivalent to about 400 mg of lincomycin ($C_{18}H_{34}N_2O_6S$), to a 100-mL volumetric flask. Add about 80 mL of *Mobile phase*, and swirl to dissolve. Dilute with *Mobile phase* to volume, and mix. Transfer 25.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed in the *Assay* under *Lincomycin Hydrochloride*. Calculate the quantity, in mg, of lincomycin ($C_{18}H_{34}N_2O_6S$) in the portion of Soluble Powder taken by the formula:

$$0.4CP(r_U / r_S)$$

in which the terms are as defined therein.

Lindane

$C_6H_6Cl_6$ 290.83

Cyclohexane, 1,2,3,4,5,6-hexachloro-, (1 α ,2 α ,3 β ,4 α ,5 α ,6 β)- γ -1,2,3,4,5,6-Hexachlorocyclohexane [58-89-9].

» Lindane is the gamma isomer of hexachlorocyclohexane. It contains not less than 99.0 percent and not more than 101.0 percent of lindane (γ - $C_6H_6Cl_6$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Lindane RS

Identification, Infrared Absorption (197K).

Congeeing temperature (651): not less than 112.0°.

Water Determination, Method I (921): not more than 0.5%.

Chloride ion—Place about 100 mg in a test tube with 10 mL of water, shake, and filter. Add 1 mL of nitric acid and 3 mL of silver nitrate TS to the filtrate: no turbidity develops.

Assay—

Internal standard solution—Dissolve *n*-octadecane in methylene chloride to obtain a solution having a concentration of about 0.5 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Lindane RS in *Internal standard solution* to obtain a solution having a known concentration of about 2 mg per mL.

System suitability solution—Prepare solutions of α -benzene hexachlorides (BHC) at 1000 μ g per mL of methanol, β -BHC at 1000 μ g per mL of acetone, and δ -BHC at 1000 μ g per mL of methanol. Transfer 100 μ L each of α -BHC, β -BHC and δ -BHC solutions to a 4-mL conical vial, and evaporate under a stream of nitrogen to dryness. Add to the vial a 100- μ L aliquot of the *Standard preparation*. Insert the stopper, and shake vigorously to dissolve the residue.

Assay preparation—Transfer about 10 mg of Lindane, accurately weighed, to a 5-mL volumetric flask. Dissolve in and dilute with *Internal standard solution* to volume.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm \times 30-m fused-silica column coated with a 1- μ m phase G46. The chromatograph is programmed as follows. The initial column temperature is maintained at 120° for 1 minute. Then, the temperature is increased at a rate of 20° per minute to 150°, and then ramped at a rate of 10° per minute to 280° and maintained at that temperature for 4 minutes. The injection port and detector temperatures are maintained at 300°. The injection split ratio is 50:1. Chromatograph the *Standard preparation* and the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times for *n*-octadecane and lindane are about 0.85 and 1.0, respectively. [NOTE—Typical retention times for α -BHC, β -BHC, γ -BHC, δ -BHC, and *n*-octadecane are 15.7, 17.8, 16.5, 18.8, and 13.9 minutes, respectively.] The resolution, *R*, between *n*-octadecane and α -BHC is not less than 21, between lindane (γ -BHC) and α -BHC is not less than 9, between β -BHC and lindane is not less than 14, and between δ -BHC and β -BHC is not less than 8; the tailing factors for *n*-octadecane and lindane are less than 1.5 and 1.2, respectively; and the relative standard deviation of the ratios of peak area responses of lindane to *n*-octadecane for replicate injections of *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 1 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of γ - $C_6H_6Cl_6$ in the portion of Lindane taken by the formula:

$$5C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Lindane RS in the *Standard preparation*; and *R_U* and *R_S* are the ratios of the peak responses of lindane to *n*-octadecane, obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lindane Cream

DEFINITION

Lindane Cream is Lindane in a suitable cream base. It contains NLT 90.0% and NMT 110.0% of the labeled amount of lindane ($\gamma\text{-C}_6\text{H}_6\text{Cl}_6$).

IDENTIFICATION

• A.

Analysis: Wind a strip of 20-mesh copper gauze 1.5 cm wide and 5 cm long around the end of a copper wire. Heat the gauze in the nonluminous flame of a Bunsen burner until it glows without coloring the flame green. Allow the gauze to cool, and repeat the heating and cooling step several times until a thorough coating of oxide is formed. Apply a small amount of Cream to the cooled gauze, ignite, and allow to burn freely in the air. Hold the gauze in the outer edge of the burner flame at a height of 4 cm.

Acceptance criteria: A bright green color is imparted to the flame.

ASSAY

• PROCEDURE

Mobile phase: Mix 18 mL of anhydrous ethyl ether with 280 mL of chromatographic hexane.

Internal standard solution: 1 mg/mL of *n*-docosane in methylene chloride

Standard stock solution: 2 mg/mL of USP Lindane RS in methylene chloride

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a graduated centrifuge tube, add 5.0 mL of *Internal standard solution*, and evaporate with the aid of gentle heat and a current of dry air to 3 mL. Avoid evaporating to dryness. If the mixture is inadvertently evaporated to dryness, discard it, and begin another *Standard solution*.

Solid support: 60- to 100-mesh magnesium silicate that has been heated previously at 300° for 2 h

Sample stock solution: Nominally 2 mg/mL of lindane from a quantity of Cream, equivalent to 10 mg of lindane, prepared as follows. Place a pledget of cotton on a removable porous plate at the base of a 25-mm × 200-mm chromatographic tube fitted with a polytef stopcock. Add 50 mL of *Mobile phase* and 10 g of *Solid support*, and stir the mixture to expel air bubbles. Add 1.5 g of anhydrous sodium sulfate to the column, and elute until the surface of the liquid is 4 cm above the *Solid support*, discarding the eluate. Transfer a portion of Cream to a 150-mL beaker, and add 10 g of *Solid support*. Mix with a spatula, adding chromatographic hexane as necessary to produce a homogeneous mixture, and continue stirring until a free-flowing powder is produced. Transfer this mixture to the chromatographic column with the aid of three 5-mL portions of *Mobile phase*, and elute the column with 225 mL of the *Mobile phase* at a flow rate of 2–3 mL/min, collecting the eluate in a 250-mL beaker. Remove the chromatographic column, add 5.0 mL of *Internal standard solution* to the eluate, and evaporate with the aid of gentle heat and a current of dry air to 5 mL.

Sample solution: Transfer the *Sample stock solution* to a graduated centrifuge tube with the aid of 1 mL of methylene chloride, and evaporate with the aid of gentle heat and a current of dry air to 3 mL. Avoid evaporating to dryness. If the mixture is inadvertently evaporated to dryness, discard it, and begin another *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 1.8-m × 2-mm glass; packed with 3% liquid phase G3 on support S1A

Temperatures

Column: 195°

Injection port: 250°

Detector: 250°

Flow rate: 40 mL/min

Injection volume: 1 μL

Carrier gas: Dry nitrogen

System suitability

Sample: *Standard solution* (6–10 replicate injections)

Suitability requirements

Resolution: NLT 5 between lindane and *n*-docosane

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lindane ($\gamma\text{-C}_6\text{H}_6\text{Cl}_6$) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of lindane to *n*-docosane in the *Sample solution*

R_S = peak response ratio of lindane to *n*-docosane in the *Standard solution*

C_S = concentration of USP Lindane RS in the *Standard stock solution* (mg/mL)

C_U = nominal concentration of lindane in the *Sample stock solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• PH (791)

Sample solution: 1-in-5 dilution

Acceptance criteria: 8.0–9.0

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**
USP Lindane RS

Lindane Lotion

» Lindane Lotion is Lindane in a suitable aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lindane ($\gamma\text{-C}_6\text{H}_6\text{Cl}_6$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Lindane RS

Identification—It responds to the *Identification* test under *Lindane Cream*.

pH (791): between 6.5 and 8.5.

Assay—Proceed as directed in the *Assay* under *Lindane Cream*, substituting "Lotion" for "Cream" throughout.

Lindane Shampoo

DEFINITION

Lindane Shampoo is Lindane in a suitable vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of lindane ($\gamma\text{-C}_6\text{H}_6\text{Cl}_6$).

IDENTIFICATION

• A.

Analysis: Wind a 1.5-cm × 5-cm strip of 20-mesh copper gauze around the end of a copper wire. Heat the

gauze in the nonluminous flame of a Bunsen burner until it glows, without coloring the flame green. Allow the gauze to cool, and repeat the heating and cooling step several times until a thorough coating of oxide is formed. Apply a small amount of Shampoo to the cooled gauze, ignite, and allow to burn freely in the air. Hold the gauze in the outer edge of the burner flame at a height of 4 cm.

Acceptance criteria: A bright green color is imparted to the flame.

ASSAY

PROCEDURE

Mobile phase: Anhydrous ethyl ether and chromatographic solvent hexane (18:280)

Internal standard solution: 1 mg/mL of *n*-docosane in methylene chloride

Standard stock solution: 2 mg/mL of USP Lindane RS in methylene chloride

Standard solution: Transfer 5.0 mL of *Standard stock solution* to a graduated centrifuge tube, add 5.0 mL of *Internal standard solution*, and evaporate with the aid of gentle heat and a current of dry air to 3 mL. Avoid evaporating to dryness. If the mixture is inadvertently evaporated to dryness, discard it, and begin another *Standard solution*.

Solid support: Use 60- to 100-mesh magnesium silicate that has been previously heated at 300° for 2 h.

Sample stock solution: Nominally 2 mg/mL of lindane from a quantity of Shampoo, equivalent to 10 mg of lindane, prepared as follows. Place a pledget of cotton on a removable porous plate at the base of a 25-mm × 200-mm chromatographic column that is fitted with a polytetrafluoroethylene stopcock. Add 50 mL of *Mobile phase* and 10 g of *Solid support*, and stir the mixture to expel air bubbles. Add 1.5 g of anhydrous sodium sulfate to the column, and elute until the surface of the liquid is 4 cm above *Solid support*, discarding the eluate. Transfer a weighed portion of Shampoo, corresponding to 10 mg of lindane, to a 150-mL beaker, and add 10 g of *Solid support*. Mix with a spatula, adding chromatographic solvent hexane as necessary to produce a homogeneous mixture, and continue stirring until a free-flowing powder is produced. Transfer this mixture to the chromatographic column with the aid of three 5-mL portions of *Mobile phase*. Elute the column with 225 mL of *Mobile phase* at a flow rate of 2–3 mL/min, collecting the eluate in a 250-mL beaker. Remove the chromatographic column, add 5.0 mL of *Internal standard solution* to the eluate, and evaporate with the aid of gentle heat and a current of dry air to 5 mL.

Sample solution: Transfer the *Sample stock solution* to a graduated centrifuge tube with the aid of 1 mL of methylene chloride, and evaporate with the aid of gentle heat and a current of dry air to 3 mL. Avoid evaporating to dryness. If the mixture is inadvertently evaporated to dryness, discard it, and begin another *Sample solution*.

Carrier gas: Dry nitrogen

Flow rate: 40 mL/min

Injection volume: 1 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5 between lindane and *n*-docosane

Tailing factor: NMT 2.0

Relative standard deviation: NMT 3.0% for 6–10 replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lindane (γ -C₆H₆Cl₆) in the portion of Shampoo taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of lindane to *n*-docosane from the *Sample solution*

R_S = peak response ratio of lindane to *n*-docosane from the *Standard solution*

C_S = concentration of USP Lindane RS in the *Standard stock solution* (mg/mL)

C_U = nominal concentration of lindane in the *Sample stock solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

pH (791): 6.2–7.0

ADDITIONAL REQUIREMENTS

PACKAGING AND STORAGE: Preserve in tight containers.

USP REFERENCE STANDARDS (11)

USP Lindane RS

Liothyronine Sodium

C₁₅H₁₁I₃NNaO₄ 672.96

L-Tyrosine, O-(4-hydroxy-3-iodophenyl)-3,5-diiodo-, monosodium salt.

Monosodium L-3-[4-(4-hydroxy-3-iodophenoxy)-3,5-diiodophenyl]alanine [55-06-1].

» Liothyronine Sodium is the sodium salt of L-3,3',5-triiodothyronine. It contains not less than 95.0 percent and not more than 101.0 percent of C₁₅H₁₁I₃NNaO₄, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Levothyroxine RS

USP Liothyronine RS

Identification—

A: The UV absorption spectrum of a 1 in 10,000 solution in dilute hydrochloric acid (1 in 50) in 80 percent alcohol exhibits maxima at the same wavelengths as that of a similar solution of USP Liothyronine RS, concomitantly measured; and the respective absorptivities, both calculated on the dried basis in terms of the acid, at the wavelength of maximum absorbance at about 297 nm, do not differ by more than 5.0%.

B: Heat about 50 mg with a few drops of sulfuric acid in a porcelain crucible: violet vapors of iodine are evolved.

C: The residue from the ignition of it meets the requirements of the tests for *Sodium* (191).

D: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific rotation (781S): between +18° and +22°.

Test solution: 20 mg per mL, in a mixture of alcohol and 1.2 N hydrochloric acid (4:1).

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 4.0% of its weight.

Limit of levothyroxine sodium—

Mobile phase and Chromatographic system—Proceed as directed in the *Assay*.

Standard solution—Proceed as directed for *Standard preparation* in the *Assay*.

Test solution—Proceed as directed for *Assay preparation* in the *Assay*.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the levothyroxine peak responses. Calculate the percentage of levothyroxine sodium ($C_{15}H_{10}I_4NNaO_4$) in the portion of Liothyronine Sodium taken by the formula:

$$100(798.85/776.87)(C_S / C_T)(r_U / r_S)$$

in which 798.85 and 776.87 are the molecular weights of levothyroxine sodium and levothyroxine, respectively; C_S is the concentration, in µg per mL, of USP Levothyroxine RS in the *Standard solution*; C_T is the concentration, in µg per mL, of Liothyronine Sodium in the *Assay preparation*; and r_U and r_S are the levothyroxine peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 5.0% of levothyroxine sodium is found.

Chloride content—Weigh accurately 100 mg, previously dried, and transfer to a platinum dish. Ignite over a low flame, protecting the dish from air currents during the ignition. When carbonization is complete, cool the dish, add 2 drops of water, and break up the charred mass thoroughly with a stirring rod. Add 10 mL of water and 5 mL of ammonium hydroxide, and mix. Transfer the slurry to a glass-stoppered, 50-mL flask, and wash the platinum dish and the stirring rod with water, adding the washings to the flask, until the volume of the solution is about 25 mL. Add 10 mL of silver nitrate solution (1 in 20), shake thoroughly, and filter through a retentive paper into a 50-mL color-comparison tube. Wash the flask and the filter paper with 10 mL of water, and add the washings to the tube. Acidify the combined filtrate and washings to litmus with nitric acid, and dilute with water to 50 mL. Prepare a control by mixing 5 mL of ammonium hydroxide, 20 mL of water, and 10 mL of silver nitrate solution (1 in 20), filtering the mixture through a retentive paper into a 50-mL color-comparison tube, then washing the filter paper with 10 mL of water into the tube, acidifying the contents of the tube to litmus with nitric acid, diluting with water to 50 mL, and adding sodium chloride solution (1 in 1000) in 0.1-mL increments until the turbidity of the control matches that of the test solution. Not more than 2.0 mL of sodium chloride is required (1.2%).

Sodium content—Weigh accurately about 100 mg, previously dried, and transfer to a platinum dish. Add 8 to 10 drops of sulfuric acid, and ignite to constant weight, taking care to avoid spattering. Each mg of residue is equivalent to 0.324 mg of Na. Correct the result for the amount of sodium equivalent to the NaCl found in the test for *Chloride content*: not less than 2.9% and not more than 4.0% is found.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (60:40) that contains 0.5 mL of phosphoric acid in each 1000 mL. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

0.01 M Methanolic sodium hydroxide—Dissolve 400 mg of sodium hydroxide in 500 mL of water. Cool, add 500 mL of methanol, and mix.

Liothyronine stock solution—Dissolve an accurately weighed quantity of USP Liothyronine RS in *0.01 M Methanolic sodium hydroxide* to obtain a solution having a known concentration of about 0.4 mg of liothyronine per mL.

Levothyroxine stock solution—Dissolve an accurately weighed quantity of USP Levothyroxine RS in *0.01 M Methanolic sodium hydroxide* to obtain a solution having a known concentration of about 0.4 mg of levothyroxine per mL. Make a 1:100 dilution of this solution using *Mobile phase*.

Standard preparation—Transfer appropriate volumes of *Liothyronine stock solution* and *Levothyroxine stock solution* to a suitable container, and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 10 µg of liothyronine per mL and 0.5 µg of levothyroxine per mL.

Assay preparation—Prepare a solution of Liothyronine Sodium in *Mobile phase* having a known concentration of about 10 µg per mL. [NOTE—A small amount of *0.01 M Methanolic sodium hydroxide* can be used to facilitate the dissolution of the sample.]

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, R , between levothyroxine and liothyronine is not less than 5.0; and the relative standard deviation for replicate injections is not more than 2.0% for liothyronine.

Procedure—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of $C_{15}H_{11}I_3NNaO_4$ in the portion of Liothyronine Sodium taken by the formula:

$$100(672.96/650.97)(C_S / C_T)(r_U / r_S)$$

in which 672.96 and 650.97 are the molecular weights of liothyronine sodium and liothyronine, respectively; C_S is the concentration, in µg per mL, of USP Liothyronine RS in the *Standard preparation*; C_T is the concentration, in µg per mL, of Liothyronine Sodium in the *Assay preparation*; and r_U and r_S are the liothyronine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Liothyronine Sodium Tablets

» Liothyronine Sodium Tablets contain an amount of $C_{15}H_{11}I_3NNaO_4$ equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of liothyronine ($C_{15}H_{12}I_3NO_4$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Levothyroxine RS

USP Liothyronine RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to

the liothyronine peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—[NOTE—All containers that are in contact with solutions containing liothyronine sodium are to be made of glass.]

Medium: pH 10.0 ± 0.05 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 250 mL.

Apparatus 3: 30 dips per minute, using 20-mesh screen on the top and 40-mesh screen on the bottom of the glass reciprocating cylinder.

Time: 45 minutes.

Determine the amount of liothyronine sodium ($C_{15}H_{12}I_3NO_4$) dissolved by employing the following method.

Ammoniated solution—Add 0.05 mL of ammonium hydroxide to 200 mL of water.

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (55:45) that contains 1 mL of phosphoric acid in each 1000 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Dissolve an accurately weighed quantity of USP Liothyronine RS in *Ammoniated solution*, and dilute quantitatively, and stepwise if necessary, with *Ammoniated solution* to obtain a solution having a known concentration of about 10 µg of USP Liothyronine RS per mL. Dilute a portion of this solution quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.5 µg of USP Liothyronine RS per mL.

Test solution—Transfer 20 mL of the solution under test to a centrifuge tube, and centrifuge until a clear supernatant is obtained.

Resolution solution—Prepare a solution of USP Liothyronine RS and USP Levothyroxine RS in *Ammoniated solution* having known concentrations of about 10 µg of each USP Reference Standard per mL. Dilute with water to obtain a concentration of about 0.5 µg of each USP Reference Standard per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between liothyronine and levothyroxine is not less than 3.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 4.0%.

Procedure—Separately inject equal volumes (about 200 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of $C_{15}H_{12}I_3NO_4$ dissolved.

Tolerances—Not less than 70% (Q) of the labeled amount of $C_{15}H_{12}I_3NO_4$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Liothyronine Sodium*.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 µg of liothyronine sodium, to a centrifuge tube, add 2 glass beads, pipet 10 mL of *Mobile phase* into the tube, and mix using a vortex mixer for 3 minutes. Centrifuge to obtain a clear supernatant, filtering if necessary.

Procedure—Proceed as directed in the *Assay* under *Liothyronine Sodium*. Calculate the quantity, in µg, of

liothyronine ($C_{15}H_{12}I_3NO_4$) in the portion of Tablets taken by the formula:

$$10C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Liothyronine RS in the *Standard preparation*; and *r_U* and *r_S* are the liothyronine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Liotrix Tablets

» Liotrix Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of Levothyroxine Sodium ($C_{15}H_{10}I_4NNaO_4$) and Liothyronine Sodium ($C_{15}H_{11}I_3NNaO_4$) in a ratio by weight of 4 to 1, respectively.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Levothyroxine RS

USP Liothyronine RS

Identification—The retention time of the two major peaks in the chromatogram of the *Assay preparation* corresponds to the levothyroxine and liothyronine peaks in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Disintegration (701): 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of water and acetonitrile (65:35) that contains 2 mL of trifluoroacetic acid in each 1000 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

0.01 M Methanolic sodium hydroxide—Dissolve 400 mg of sodium hydroxide in 500 mL of water. Cool, add 500 mL of methanol, and mix.

Levothyroxine stock solution—Dissolve an accurately weighed quantity of USP Levothyroxine RS in *0.01 M Methanolic sodium hydroxide* to obtain a solution having a known concentration of about 0.4 mg of levothyroxine per mL.

Liothyronine stock solution—Dissolve an accurately weighed quantity of USP Liothyronine RS in *0.01 M Methanolic sodium hydroxide* to obtain a solution having a known concentration of about 0.4 mg of liothyronine per mL. Make a 1:10 dilution of this solution using *Mobile phase*.

Standard preparation—Transfer appropriate volumes of *Levothyroxine stock solution* and *Liothyronine stock solution* to a suitable container, and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having known concentrations of about 10 µg of levothyroxine per mL and 2.5 µg of liothyronine per mL.

Assay preparation—Transfer 20 Tablets to a 200-mL volumetric flask, add 180 mL of *Mobile phase*, and sonicate for 15 minutes, occasionally swirling the flask to accelerate the disintegration of the Tablets. Cool to room temperature, and dilute with *Mobile phase* to volume. Transfer a portion of the solution to a centrifuge tube, and centrifuge for 10 minutes at 5000 rpm. Quantitatively dilute a portion of the clear supernatant with *Mobile phase* to obtain concentrations of about 10.0 µg of levothyroxine sodium per mL and 2.5 µg of liothyronine sodium per mL.

Chromatographic system—Proceed as directed in the *Assay* under *Levothyroxine Sodium*.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Levothyroxine Sodium*. Calculate the quantity, in μg , of levothyroxine sodium ($\text{C}_{15}\text{H}_{10}\text{I}_4\text{NNaO}_4$) in the portion of Tablets taken by the formula:

$$(798.86/776.87)(10C)(r_U / r_S)$$

in which 798.86 and 776.87 are the molecular weights of levothyroxine sodium and levothyroxine, respectively; C is the concentration, in μg per mL, of USP Levothyroxine RS in the *Standard preparation*; and r_U and r_S are the levothyroxine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Calculate the quantity, in μg of liothyronine sodium ($\text{C}_{15}\text{H}_{11}\text{I}_3\text{NNaO}_4$) in the portion of Tablets taken by the formula:

$$(672.96/650.98)(10C)(r_U / r_S)$$

in which 672.96 and 650.98 are the molecular weights of liothyronine sodium and liothyronine, respectively; C is the concentration, in μg per mL, of USP Liothyronine RS in the *Standard preparation*; and r_U and r_S are the liothyronine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lipid Injectable Emulsion

» Lipid Injectable Emulsion used in total parenteral nutrition is a sterile 10 (0.10 g per mL), 20 (0.20 g per mL), or 30 (0.30 g per mL) percent w/v emulsion in an aqueous vehicle. The aqueous phase contains 0.6 percent to 1.8 percent w/v parenteral Egg Phospholipids in Water for Injection and contains, if necessary, an osmotic agent, such as glycerin in amounts of 1.7 percent to 2.5 percent w/v, or a suitable stabilizer, such as a fatty acid salt. The most frequently used oil present is Soybean Oil, which provides an ample supply of the essential fatty acids: linoleic acid and linolenic acid. Other oils, such as Safflower Oil, Medium-Chain Triglycerides, Olive Oil, Fish Oil, or other suitable oils, can be mixed with Soybean Oil. Hence, Soybean Oil can be the only oil or be part of a mixture of these other oils. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of the total oil(s). It contains no antimicrobial agents. The final products are terminally sterilized.

Packaging and storage—Preserve in an appropriate container (see *Packaging and Storage Requirements* (659), *Injection Packaging*). Use elastomeric closures that are compatible with both the oil and water phases of the Emulsion. Store at a temperature not below 4° (protect from freezing) or above 30° (protect from excessive heat).

Labeling—The label states the identity and the quantities of the specific oils in the Emulsion. The label states the total osmolar concentration (or osmolarity) in mOsm per L. The labeling provides the following information: do not use if there is evidence of excessive creaming or aggregation, if excessive free oil droplets are visible, or if there are other indications of compromised integrity, such as microbial growth, present in the product.

USP Reference standards (11)—
USP Endotoxin RS

Fatty acid composition—Transfer a volume of the Emulsion, equivalent to about 200 mg of lipids, to a stoppered extraction vessel, add 10 mL of ether, and mix. Add 5 g of anhydrous sodium sulfate, mix, and allow the mixture to stand until separation of the layers is complete. Wet the packing of a chromatographic silica cartridge with a few mL of ether, transfer about 5 mL of the ether layer from the extraction vessel to the column reservoir, and elute at a rate of between 5 and 10 drops per minute into a suitable vessel. Evaporate the ether from the eluant, and dissolve the residue in 5.0 mL of toluene. Transfer 1.0 mL of the toluene solution to a reaction vial, and add 0.4 mL of (*m*-trifluoromethylphenyl) trimethylammonium hydroxide in methanol. Cover, mix, and allow to stand for 30 minutes. Inject about 1 μL of this solution into a gas chromatograph equipped with a 0.53-mm \times 50-m wide-bore, fused-silica capillary column coated with a 2.0- μm thickness of liquid phase G16 and maintained at a temperature of 200°. The column is connected to a flame-ionization detector. Helium is used as the carrier gas at a flow rate of about 10 mL per minute. Measure the main peak areas of the methyl esters of the fatty acids. The relative peak areas expressed as a percentage of the main peaks are in the known ranges for the oil (e.g., Soybean Oil, USP; Safflower Oil, USP) as specified on the label. For oil mixtures, analysis of each oil should be performed to identify known peaks prior to emulsification as specified on the label.

Bacterial Endotoxins Test (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

pH (791): between 6.0 and 9.0.

Globule size limits—The Injectable Emulsion meets the requirements of the limits specified in both *Method I* and *Method II* as directed under *Globule Size Distribution in Lipid Injectable Emulsions* (729).

Limit of oil droplet mean diameters (See *Method I—Light Scattering Method* under *Globule Size Distribution in Lipid Injectable Emulsions* (729))—Using the method of light scattering, determine the mean droplet diameter (MDD): the sample meets the requirements. The intensity-weighted mean droplet diameter (MDD) for the Injectable Emulsion must be ≤ 500 nm, or 0.5 μm , irrespective of the concentration of the dispersed lipid phase.

Limit of large globule volume-diameter (See *Method II—Light Obscuration or Extinction Method* under *Globule Size Distribution in Lipid Injectable Emulsions* (729))—Using the method of light obscuration, determine the size distribution of globules in the large-diameter tail of the dispersion (detection threshold ≥ 2.0 μm). Calculate the volume-weighted mass of lipid in the form of globules with diameters in excess of 5.0 μm per 100 mL of the Injectable Emulsion. The volume-weighted, large-diameter fat globule limits of the dispersed phase, expressed as the percentage of fat residing in globules larger than 5 μm (PFAT5) for a given Injectable Emulsion, is not to exceed 0.05%.

Limit of free fatty acid—

Solvent—Prepare a mixture of heptane, isopropanol, and water (400:400:200) in a separatory funnel. Allow the phases to separate, and discard the lower phase. Filter the upper phase (heptane solution) through 40 g of anhydrous sodium sulfate. Store in a tightly capped glass container, and use within 1 week.

Chromatographic column—Prepare a slurry of heptane and chromatographic silica gel having an average pore size of 6 nm, and activate at a temperature of 110° for not less than 1 hour prior to use. Transfer the slurry to a 2.3-cm chromatographic tube (see *Column Chromatography* under *Chromatography* (621)), and pack to a bed height of between 5 cm and 6 cm. Wash the column with about 40 mL of heptane, and drain the heptane through the column to a level of about 0.5 cm above the silica gel bed.

Procedure—Transfer 20.0 mL of the Injectable Emulsion to a flask, freeze, and lyophilize. Dissolve the residue in 30 mL of *Solvent*, and transfer the solution to the column. Rinse

the flask with three 30-mL portions of *Solvent*, and transfer the washings to the column, allowing each rinsing to drain to the top of the column bed before applying the next rinse. Collect a total of 120 mL of effluent. Add 10 drops of phenolphthalein TS to the effluent, bubble nitrogen through the solution, and titrate with 0.02 N alcoholic potassium hydroxide VS until the solution remains pale pink after mixing for 10 seconds. Titrate a blank using 120 mL of *Solvent*. Calculate the quantity, in mEq, of free fatty acids per g of oil in the Injectable Emulsion using the formula:

$$(V_U - V_B)N / 20C$$

in which V_U is the volume, in mL, of 0.02 N alcoholic potassium hydroxide consumed by the eluant; V_B is the volume, in mL, of 0.02 N alcoholic potassium hydroxide consumed by the blank; N is the normality of the 0.02 N alcoholic potassium hydroxide; and C is the labeled concentration, in g per mL, of the total oil(s) in the Injectable Emulsion: not more than 0.07 mEq of free fatty acids per g of oil is found.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Prepare a filtered and degassed mixture of isopropanol, ethyl acetate, and glacial acetic acid (179:20:1).

Standard preparation—Dissolve an accurately weighed portion of Soybean Oil (or other relevant oils used in the Emulsion) in *Mobile phase* to obtain a solution having a known concentration of about 8 mg per mL.

Assay preparation—Transfer an accurately measured portion of Emulsion, equivalent to about 800 mg of oil, to a 100-mL volumetric flask with the aid of additional portions of *Mobile phase*. Dilute with *Mobile phase* to volume, and mix to obtain a solution containing about 8 mg of oil per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector and a 4.1-mm × 25-cm column that contains packing L21. The flow rate is about 1 mL per minute, adjusted so that the peak due to oil elutes at about 6.5 minutes. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , is not less than 1.0; the tailing factor for the oil peak is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of oil in the portion of Emulsion taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of Soybean Oil or other relevant oils used in the Emulsion in the *Standard preparation*; and r_U and r_S are the Emulsion responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lisinopril

$C_{21}H_{31}N_3O_5 \cdot 2H_2O$ 441.52
L-Proline, 1-[*N*²-(1-carboxy-3-phenylpropyl)-L-lysyl]-, dihydrate, (*S*)-;
1-[*N*²-[(*S*)-1-Carboxy-3-phenylpropyl]-L-lysyl]-L-proline dihydrate [83915-83-7].

DEFINITION

Lisinopril contains NLT 98.0% and NMT 102.0% of lisinopril ($C_{21}H_{31}N_3O_5$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 2.76 g/L of monobasic sodium phosphate in water prepared as follows. Dissolve 2.76 g of monobasic sodium phosphate in about 900 mL of water in a 1000-mL volumetric flask. Adjust with 1 N sodium hydroxide to a pH of 5.0 and dilute with water to volume.

Mobile phase: Acetonitrile and *Solution A* (4:96)

Standard solution: 0.3 mg/mL of USP Lisinopril RS in water

Sample solution: 0.3 mg/mL of Lisinopril in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; 5- μ m packing L7

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.7

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lisinopril ($C_{21}H_{31}N_3O_5$) in the portion of Lisinopril taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response of lisinopril from the *Sample solution*

r_S = peak response of lisinopril from the *Standard solution*

C_S = concentration of USP Lisinopril RS in the *Standard solution* (mg/mL)

C_U = concentration of Lisinopril in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, *Method II* (231): 0.001% (Official 1-Jan-2018)

Samples: Standard solution and Sensitivity solution

Suitability requirements

Relative standard deviation: NMT 10.0%, Standard solution

Signal-to-noise ratio: NLT 10, Sensitivity solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Lisinopril taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of each impurity from the Sample solution

r_s = peak response of lisinopril from the Standard solution

C_s = concentration of USP Lisinopril RS in the Standard solution (mg/mL)

C_u = concentration of Lisinopril in the Sample solution (mg/mL)

F = relative response factor (see Table 2)

Acceptance criteria: See Table 2. Disregard any peak less than 0.05%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
N-Alkyl-L-lysine ^a	0.57	0.35	0.3
DL-Homophenylalanine ^b	0.72	1.08	0.30
Lisinopril	1.00	1.00	—
Lisinopril epimer ^c	1.33	0.76	0.3
Lisinopril cyclohexyl analog ^d	2.93	0.39	0.30
R,S,S-Diketopiperazine ^e	3.88	0.79	0.3
S,S,S-Diketopiperazine (lisinopril related compound A) ^f	4.04	0.76	0.3
N-Alkyl lisinopril ^g	4.60	0.86	0.15
Any individual unspecified impurity	—	1.00	0.1
Total impurities ^h	—	—	0.5

^a [(S)-1-Carboxy-3-phenylpropyl]-L-lysine.

^b 2-Amino-4-phenylbutanoic acid.

^c [(R)-1-Carboxy-3-phenylpropyl]-L-lysyl-L-proline.

^d [(S)-1-Carboxy-3-cyclohexylpropyl]-L-lysyl-L-proline.

^e (S)-2-[(3S,8aR)-3-(4-Aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-d]pyrazin-2(1H)-yl]-4-phenylbutanoic acid.

^f (S)-2-[(3S,8aS)-3-(4-Aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-d]pyrazin-2(1H)-yl]-4-phenylbutanoic acid.

^g N^ε,N^ε-Bis[(S)-1-Carboxy-3-phenylpropyl]-L-lysyl-L-proline.

^h Total impurities does not include lisinopril epimer.

SPECIFIC TESTS

- **OPTICAL ROTATION** (781S), *Specific Rotation*

Diluent: 0.25 M zinc acetate solution prepared as follows. Mix 600 mL of water with 150 mL of glacial acetic acid and 54.9 g of zinc acetate, and stir to dissolve the zinc acetate. While stirring, add 150 mL of ammonium hydroxide, cool to room temperature, and adjust with ammonium hydroxide to a pH of 6.4. Transfer the solution to a 1000-mL volumetric flask, and dilute with water to volume.

Sample solution: 10 mg/mL of Lisinopril in Diluent

Acceptance criteria: −115.3° to −122.5° (λ = 405 nm)

- **WATER DETERMINATION** (921), *Method I*: 8.0%–9.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Lisinopril RS

Lisinopril Compounded Oral Suspension**DEFINITION**

Lisinopril Compounded Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of lisinopril (C₂₁H₃₁N₃O₅).

Prepare Lisinopril Compounded Oral Suspension 1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Lisinopril tablets ^a equivalent to	100 mg of lisinopril
Vehicle: a 1:1 mixture of Ora-Sweet ^b and Ora-Plus, ^b a sufficient quantity to make	100 mL

^a Prinivil 10-mg tablets, Merck & Co., West Point, PA.

^b Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of *Lisinopril tablets* in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a lisinopril liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

ASSAY**• PROCEDURE**

Solution A: 4.1 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase: 1.0 g/L of sodium 1-hexanesulfonate in acetonitrile and *Solution A* (18:82). Filter and degas.

Diluent: Methanol and water (20:80)

Standard solution: 0.2 mg/mL of USP Lisinopril RS in *Diluent*

Sample solution: Shake thoroughly by hand each bottle of Oral Suspension. Mix 1.0 mL of Oral Suspension with 4.0 mL of *Diluent* to obtain a solution having a nominal concentration of 0.2 mg/mL of lisinopril.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 1.0 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

[NOTE—The retention time for lisinopril is about 12.9 min.]

Suitability requirements

Column efficiency: NLT 1800 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lisinopril ($C_{21}H_{31}N_3O_5$) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lisinopril RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lisinopril in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- pH (791):** 4.3–5.3

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store in a refrigerator or at controlled room temperature.
- BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored in a refrigerator or at controlled room temperature
- LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

• USP REFERENCE STANDARDS (11)

USP Lisinopril RS

Lisinopril Tablets

» Lisinopril Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{21}H_{31}N_3O_5$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Lisinopril RS

Identification—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of lisinopril dissolved using the following method.

Mobile phase and Chromatographic system—Prepare as directed in the *Assay*.

Determine the amount of lisinopril dissolved by one of the following procedures.

PROCEDURE FOR POOLED SAMPLE—Proceed as directed for *Procedure* in *Apparatus 1* and *Apparatus 2*, *Immediate-Release Dosage Forms* under *Dissolution* (711). Combine equal volumes of the filtered solutions of the 6 or 12 individual specimens withdrawn, and use the pooled sample as the test solution. Inject a volume of the pooled sample into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a *Standard solution* having a known concentration of USP Lisinopril RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{21}H_{31}N_3O_5$ in the Tablets is dissolved in 30 minutes: the requirements are met if the quantities of active ingredient dissolved from the pooled sample conform to the accompanying *Acceptance Table for a Pooled Sample*. Continue testing through the three stages unless the results conform at either S_1 or S_2 . The quantity, Q, is the amount of dissolved active ingredient specified, expressed as a percentage of the labeled content.

Acceptance Table for a Pooled Sample

Stage	Number Tested	Acceptance Criteria
S_1	6	Average amount dissolved is not less than Q + 10%.
S_2	6	Average amount dissolved ($S_1 + S_2$) is equal to or greater than Q + 5%.
S_3	12	Average amount dissolved ($S_1 + S_2 + S_3$) is equal to or greater than Q.

PROCEDURE FOR UNIT SAMPLE—Proceed as directed for *Procedure* in *Apparatus 1* and *Apparatus 2*, *Immediate-Release Dosage Forms* under *Dissolution* (711). Inject a volume of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the amount of $C_{21}H_{31}N_3O_5$ dissolved in comparison with a *Standard solution* having a known concentration of USP Lisinopril RS in the *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{21}H_{31}N_3O_5$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—

Phosphate solution, Mobile phase, and Chromatographic system—Prepare as directed in the Assay.

Diluent—Dissolve 2.72 g of monobasic potassium phosphate in 800 mL of water, adjust with phosphoric acid to a pH of 4.0, dilute with water to 1000 mL, and mix.

Standard preparation—Dissolve an accurately weighed quantity of USP Lisinopril RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

Test preparation—Place one Tablet in a volumetric flask of appropriate size, based on the labeled quantity, in mg, of lisinopril in the Tablet, to obtain a solution containing 0.2 mg of lisinopril per mL. Fill the flask to about 50% volume with *Diluent*, sonicate for 5 minutes, and shake by mechanical means for 20 minutes. Dilute with *Diluent* to volume, mix, and filter.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{21}H_{31}N_3O_5$ in the Tablet taken by the formula:

$$(TC / D)(r_U / r_S)$$

in which *T* is the labeled quantity, in mg, of lisinopril in the Tablet; *C* is the concentration, in mg per mL, calculated on the anhydrous basis, of USP Lisinopril RS in the *Standard preparation*; *D* is the concentration, in mg per mL, of lisinopril in the *Test preparation*, based upon the labeled quantity per Tablet and the extent of dilution; and *r_U* and *r_S* are the lisinopril peak responses obtained from the *Test preparation* and the *Standard preparation*, respectively.

Related compounds—

Phosphate solution, Mobile phase, Diluent, and Chromatographic system—Prepare as directed in the Assay.

Standard solution—Dilute the *Standard preparation*, prepared as directed in the Assay, with *Diluent* to obtain a solution having a known concentration of about 20 μ g per mL.

Test solution—Use the Assay preparation.

Procedure—Proceed as directed in the Assay. Measure the responses of the lisinopril peak obtained from the *Standard solution*, and of all peaks other than that of lisinopril obtained from the *Test solution*. Calculate the percentage of related compounds in each Tablet taken by the formula:

$$100(V / 10)(C / L)(r_U / r_S)$$

in which *V* is the volume, in mL, of the *Test solution*; *C* is the concentration, in mg per mL, calculated on the anhydrous basis, of USP Lisinopril RS in the *Standard solution*; *L* is the quantity, in mg, of lisinopril in each Tablet, taken as determined in the Assay; *r_U* is the sum of all peak responses other than that of lisinopril obtained from the *Test solution*; and *r_S* is the lisinopril peak response obtained from the *Standard solution*: not more than 2.0%, calculated on the basis of the quantity, in mg, of lisinopril in the portion of Tablets taken, as determined in the Assay, is found.

Assay—

Phosphate solution—Dissolve 4.1 g of monobasic potassium phosphate in about 900 mL of water in a 1000-mL volumetric flask, and adjust with phosphoric acid to a pH of 2.0. Dilute with water to volume, and mix.

Mobile phase—Dissolve 1.0 g of sodium 1-hexanesulfonate in 820 mL of *Phosphate solution*. Add 180 mL of acetonitrile, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Diluent—Prepare a mixture of water and methanol (4:1).

Standard preparation—Dissolve an accurately weighed quantity of USP Lisinopril RS in *Diluent* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer to a suitable size volumetric flask 10 Tablets, which when diluted with *Diluent* will yield a solution having a concentration of about 0.2 mg per mL. Add *Diluent*, and sonicate for 5 minutes. Shake the flask by mechanical means for 20 minutes, dilute with *Diluent* to volume, mix, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm \times 20-cm column that contains packing L7 and is maintained at a temperature of 40°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 700 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; the capacity factor, *k'*, for the analyte peak is greater than 1.5; and the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of $C_{21}H_{31}N_3O_5$ in each Tablet taken by the formula:

$$(L/D)C(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of lisinopril in each Tablet, *D* is the concentration, in mg per mL, of lisinopril in the *Assay preparation* based on the labeled quantity per Tablet and the extent of dilution; *C* is the concentration, in mg per mL, calculated on the anhydrous basis, of USP Lisinopril RS in the *Standard preparation*; and *r_U* and *r_S* are the lisinopril peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lisinopril and Hydrochlorothiazide Tablets

DEFINITION

Lisinopril and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lisinopril ($C_{21}H_{31}N_3O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

- A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

The Tablets must be assayed within 24 h of the time they are put in the solution.

Buffer: Dissolve 4.08 g of monobasic potassium phosphate in 800 mL of water. Adjust with phosphoric acid to a pH of 2.5, and dilute with water to 1 L.

Mobile phase: Acetonitrile, triethylamine, water, and phosphoric acid (280:3:1480:15)

Lisinopril standard stock solution: 0.5 mg/mL of USP Lisinopril RS in *Buffer*

Hydrochlorothiazide standard stock solution: 3.12 mg/mL of USP Hydrochlorothiazide RS in methanol

Lisinopril related compound A stock solution: 0.05 mg/mL of USP Lisinopril Related Compound A RS in methanol

Benzothiadiazine related compound A stock solution: 0.016 mg/mL of USP Benzothiadiazine Related Compound A RS in methanol

Standard solution: 0.1 mg/mL of USP Lisinopril RS, 0.125 mg/mL of USP Hydrochlorothiazide RS, 2 µg/mL of USP Lisinopril Related Compound A RS, and 1.3 µg/mL of USP Benzothiadiazine Related Compound A RS in Buffer from Lisinopril standard stock solution, Hydrochlorothiazide standard stock solution, Lisinopril related compound A stock solution, and Benzothiadiazine related compound A stock solution. For Tablet strengths 20/12.5 of lisinopril/hydrochlorothiazide, the concentration of USP Lisinopril RS and USP Lisinopril Related Compound A RS in the Standard solution is 0.2 mg/mL and 4 µg/mL, respectively.

Sample stock solution: Transfer 10 Tablets to a suitable volumetric flask. Add Buffer (0.25 mL/mg of total lisinopril), sonicate for 5 min, and then add methanol (0.5 mL/mg of total lisinopril). Sonicate for an additional 10 min. Add more Buffer (0.75 mL/mg of total lisinopril), and mix by mechanical means for 20 min. Dilute with water to volume to prepare solutions as described in Table 1.

Table 1

Tablet Strength of Lisinopril/Hydrochlorothiazide (mg/Tablet)	Nominal Concentration of Lisinopril/Hydrochlorothiazide (mg/mL)
10/12.5	0.4/0.5
20/12.5	0.4/0.25
20/25	0.4/0.5

Sample solution: Dilute the Sample stock solution with Buffer to prepare solutions as described in Table 2. Pass a portion through a suitable filter of 0.45-µm pore size.

Table 2

Tablet Strength of Lisinopril/Hydrochlorothiazide (mg/Tablet)	Nominal Concentration of Lisinopril/Hydrochlorothiazide (mg/mL)
10/12.5	0.1/0.12
20/12.5	0.2/0.125
20/25	0.1/0.12

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-µm packing L7

Flow rate: 1.5 mL/min

Injection volume: 10 µL

Run time: NLT 10 min

System suitability

Sample: Standard solution

Suitability requirements

Resolution: NLT 3.0 between lisinopril and benzothiadiazine related compound A and NLT 4.0 between hydrochlorothiazide and benzothiadiazine related compound A

Tailing factor: NMT 2 for both the lisinopril and hydrochlorothiazide peaks

Relative standard deviation: NMT 2.0% for both the lisinopril and hydrochlorothiazide peaks

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of lisinopril ($C_{21}H_{31}N_3O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lisinopril or hydrochlorothiazide from the Sample solution

r_S = peak response of lisinopril or hydrochlorothiazide from the Standard solution

C_S = concentration of USP Lisinopril RS or USP Hydrochlorothiazide RS in the Standard solution (mg/mL)

C_U = nominal concentration of lisinopril or hydrochlorothiazide in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min for hydrochlorothiazide; 30 min for lisinopril

Buffer and Mobile phase: Prepare as directed in the Assay.

Lisinopril standard stock solution: 0.5 mg/mL of USP Lisinopril RS in Buffer

Hydrochlorothiazide standard stock solution: 0.44 mg/mL of USP Hydrochlorothiazide RS in methanol

Standard solution: Prepare solutions in Medium as described in Table 3 from the Lisinopril standard stock solution and Hydrochlorothiazide standard stock solution.

Table 3

Tablet Strength of Lisinopril/Hydrochlorothiazide (mg/Tablet)	Nominal Concentration of Lisinopril/Hydrochlorothiazide (mg/mL)
10/12.5	0.01/0.013
20/12.5	0.02/0.013
20/25	0.02/0.026

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45-µm pore size, and discard the first few mL of the filtrate.

Chromatographic system: Proceed as directed in the Assay, except use an injection volume of 20 µL.

System suitability

Sample: Standard solution

Suitability requirements

Resolution: NLT 4.0 between the lisinopril and hydrochlorothiazide peaks

Tailing factor: NMT 2 for both the lisinopril and hydrochlorothiazide peaks

Column efficiency: NLT 6000 theoretical plates for the hydrochlorothiazide peak

Relative standard deviation: NMT 2.0% for both the lisinopril and hydrochlorothiazide peaks

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amounts of lisinopril ($C_{21}H_{31}N_3O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of lisinopril or hydrochlorothiazide from the Sample solution

r_S = peak response of lisinopril or hydrochlorothiazide from the Standard solution

C_S = concentration of lisinopril and hydrochlorothiazide in the Standard solution from Table 3 (mg/mL)

L = labeled amount of lisinopril and hydrochlorothiazide (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amounts of lisinopril ($C_{21}H_{31}N_3O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution* Test 2.

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Times: 30 min for both lisinopril and hydrochlorothiazide

Buffer: 2.76 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.

Mobile phase: Acetonitrile and *Buffer* (6:94)

Standard stock solution 1 (for Tablets labeled to contain 10 mg/12.5 mg or 20 mg/25 mg of lisinopril/hydrochlorothiazide): 0.11 mg/mL of USP Lisinopril RS and 0.14 mg/mL of USP Hydrochlorothiazide RS, prepared as follows. Add acetonitrile to fill 1.5% of the total volume, sonicate until dissolved, and dilute with *Medium* to volume.

Standard stock solution 2 (for Tablets labeled to contain 20 mg/12.5 mg of lisinopril/hydrochlorothiazide): 0.22 mg/mL of USP Lisinopril RS and 0.14 mg/mL of USP Hydrochlorothiazide RS, prepared as follows. Add acetonitrile to fill 1.5% of the total volume, sonicate until dissolved, and dilute with *Medium* to volume.

Standard solution: Prepare solutions, in *Medium*, of lisinopril and hydrochlorothiazide as described in Table 4 from either *Standard stock solution 1* or *Standard stock solution 2*.

Table 4

Tablet Strength of Lisinopril/Hydrochlorothiazide (mg/Tablet)	Nominal Concentration of Lisinopril/Hydrochlorothiazide (mg/mL)
10/12.5	0.011/0.014
20/12.5	0.022/0.014
20/25	0.022/0.028

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 20-cm; 5- μ m packing L7

Column temperature: 50°

Flow rate: 1.0 mL/min

Injection volume: 50 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.8 for the lisinopril peak and NMT 1.5 for the hydrochlorothiazide peak

Resolution: NLT 3.5 between the lisinopril and hydrochlorothiazide peaks

Relative standard deviation: NMT 2.0% for both peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of lisinopril ($C_{21}H_{31}N_3O_5$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of lisinopril or hydrochlorothiazide from the *Sample solution*

r_S = peak response of lisinopril or hydrochlorothiazide from the *Standard solution*

C_S = concentration of lisinopril or hydrochlorothiazide in the *Standard solution* (mg/mL)

L = labeled amounts of lisinopril or hydrochlorothiazide (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of lisinopril ($C_{21}H_{31}N_3O_5$) and NLT 75% (Q) of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) are dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer, Mobile phase, Benzothiadiazine related compound A stock solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Standard solution 1: Use the *Standard solution*, prepared as directed in the *Assay*.

Standard solution 2: 1.28 μ g/mL of USP Benzothiadiazine Related Compound A RS in *Buffer* from the *Benzothiadiazine related compound A stock solution*

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

Calculate the percentage of lisinopril related compound A and benzothiadiazine related compound A in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response of lisinopril related compound A or benzothiadiazine related compound A from the *Sample solution*

r_S = peak response of lisinopril related compound A or benzothiadiazine related compound A from *Standard solution 1* or *Standard solution 2*

C_S = concentration of USP Lisinopril Related Compound A RS in *Standard solution 1* or USP Benzothiadiazine Related Compound A RS in *Standard solution 2* (mg/mL)

C_U = nominal concentration of lisinopril or hydrochlorothiazide in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of lisinopril, 405.5, for calculating the percentage of lisinopril related compound A; or molecular weight of hydrochlorothiazide, 297.74, for calculating the percentage of benzothiadiazine related compound A

M_{r2} = molecular weight of lisinopril related compound A, 387.47; or benzothiadiazine related compound A, 285.73

Acceptance criteria

Individual impurities: NMT 2% of lisinopril related compound A; NMT 1% of benzothiadiazine related compound A

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** (11)

Lithium Oral Solution

DEFINITION

Lithium Oral Solution is prepared from Lithium Citrate or Lithium Hydroxide to which an excess of Citric Acid has been added. It contains NLT 90.0% and NMT 110.0% of the labeled amount of lithium (Li).

IDENTIFICATION

- **A.** The emission intensity at 671 nm of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Citrate (191):** Meets the requirements

ASSAY

PROCEDURE

Surfactant solution: 1%–2% solution of nonionic surfactant, such as t-dodecyl mercaptan ethoxylate or polyoxyethylene (20) sorbitan monolaurate, in water
Standard stock solution: 0.3 mg/mL of USP Lithium Carbonate RS prepared as follows. Transfer the required quantity of USP Lithium Carbonate RS to a suitable volumetric flask, and add 20% of the flask volume of water and 0.5% of the flask volume of hydrochloric acid. Shake until dissolved.

Standard solution: 6 µg/mL of USP Lithium Carbonate RS from the *Standard stock solution* prepared as follows. Transfer a suitable volume of the *Standard stock solution* to a suitable volumetric flask. Add 80% of the flask volume of water and 2% of the flask volume of *Surfactant solution*, and dilute with water to volume. Determine the pH of the solution.

Sample stock solution: Nominally 0.06 mg/mL of lithium in water prepared as follows. Transfer a volume of Oral Solution equivalent to NLT 60 mg of lithium to a suitable volumetric flask. Dilute with water to volume.

Sample solution: Nominally 1.2 µg/mL of lithium from the *Sample stock solution* prepared as follows. Transfer a suitable volume of the *Sample stock solution* to a suitable volumetric flask. Add 95% of the flask volume of water, 0.2% of the flask volume of 1 N hydrochloric acid, and 2% of the flask volume of the *Surfactant solution*. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to the same pH (± 0.1 pH unit) as that of the *Standard solution*, and dilute with water to volume.

Blank: *Surfactant solution*

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: About 671 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
 Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of lithium (Li) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (A_r/M_r) \times F \times 100$$

r_U = photometer reading of the *Sample solution*

r_S = photometer reading of the *Standard solution*

C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of lithium in the *Sample solution* (µg/mL)

A_r = atomic weight of lithium, 6.94

M_r = molecular weight of lithium carbonate, 73.89

F = number of lithium ions in one mole of lithium carbonate, 2

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for oral solution packaged in single-unit containers

SPECIFIC TESTS

- **pH (791):** 4.0–5.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
 USP Lithium Carbonate RS

Lithium Carbonate

Li_2CO_3 73.89
 Carbonic acid, dilithium salt;
 Dilithium carbonate [554-13-2].

DEFINITION

Lithium Carbonate contains NLT 99.0% of lithium carbonate (Li_2CO_3), calculated on the dried basis.

IDENTIFICATION

- **A.** It effervesces upon the addition of an acid, yielding a colorless gas that, when passed into calcium hydroxide TS, immediately forms a white precipitate.
- **B.** When moistened with hydrochloric acid, it imparts an intense crimson color to a nonluminous flame.

ASSAY

PROCEDURE

Sample solution: Dissolve 0.5 g of Lithium Carbonate in 25.0 mL of 1 N hydrochloric acid VS.

Blank: 25.0 mL of 1 N hydrochloric acid VS

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Indicator: Methyl orange TS

Analysis

Samples: *Sample solution* and *Blank*

Titrate the excess acid in the *Sample solution* with *Titrant*.

Calculate the percentage of lithium carbonate (Li_2CO_3) in the portion of Lithium Carbonate taken:

$$\text{Result} = (V_B - V_S) \times N \times F \times (1/W) \times 100$$

V_B = *Titrant* volume consumed by the *Blank* (mL)

V_S = *Titrant* volume consumed by the *Sample solution* (mL)

N = normality of *Titrant* (mEq/mL)

F = equivalent weight of Lithium Carbonate, 36.95 mg/mEq

W = weight of Lithium Carbonate in the *Sample solution* (mg)

Acceptance criteria: NLT 99.0% on the dried basis

IMPURITIES

ALUMINUM AND IRON

Sample solution: Dissolve 500 mg of Lithium Carbonate in 10 mL of water by the dropwise addition, with agitation, of hydrochloric acid.

Analysis: Boil the *Sample solution*, then cool it. To 5 mL of the solution add 6 N ammonium hydroxide until the reaction is alkaline.

Acceptance criteria: No turbidity or precipitate is observed.

• **CALCIUM**

Sample solution: Suspend 5.0 g of Lithium Carbonate in 50 mL of water, and add a slight excess of 3 N hydrochloric acid. Boil the clear solution to expel carbon dioxide, add 5 mL of ammonium oxalate TS, render alkaline with 6 N ammonium hydroxide, and allow to stand for 4 h. Pass through a filtering crucible, and wash with warm water until the last washing yields no turbidity with calcium chloride TS. Place the crucible in a beaker, cover the crucible with water, add 3 mL of sulfuric acid, and heat to 70°.

Analysis: Titrate the *Sample solution* with 0.10 N potassium permanganate to a pale pink color that persists for 30 s.

Acceptance criteria: NMT 3.8 mL of 0.10 N potassium permanganate is consumed (0.15%).

• **SODIUM**

Standard stock solution: 500 µg/mL of sodium prepared as follows. Dissolve 1.271 g of sodium chloride, previously dried at 130° to constant weight, in water in a 1000-mL volumetric flask. Dilute with water to volume.

Sample stock solution: 100 mg/mL of Lithium Carbonate prepared as follows. Suspend 20.0 g of Lithium Carbonate in 100 mL of water, cautiously add 50.0 mL of hydrochloric acid, transfer to a 200-mL volumetric flask, and dilute with water to volume.

Standard solution: Transfer 1 mL of *Standard stock solution* and 5 mL of *Sample stock solution* to a 100-mL volumetric flask, and dilute with water.

Sample solution: 5 mg/mL of Lithium Carbonate from *Sample stock solution* diluted with water

Instrumental conditions

Mode: Flame photometry

Analytical wavelengths: 580 and 589 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Set the flame photometer for maximum emission at 589 nm, using the *Standard solution*. Measure the emission intensities of the *Sample solution* at 580 and 589 nm.

Acceptance criteria: The difference between the intensities observed at 580 and 589 nm for the *Sample solution* does not exceed the difference between the intensities observed at 589 nm for the *Sample solution* and the *Standard solution*, respectively (0.1%).

Delete the following:

• **HEAVY METALS (231)**

Sample solution: Dissolve 1 g of Lithium Carbonate in 10 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm • (Official 1-Jan-2018)

• **CHLORIDE AND SULFATE, Sulfate (221)**

Standard solution: Transfer 1 mL of 0.020 N sulfuric acid and 1 mL of 3 N hydrochloric acid to a suitable container. Dilute with water to 40 mL.

Sample solution: Transfer 1.0 g of Lithium Carbonate to a suitable container. Dissolve 10 mL of 3 N hydrochloric acid. Dilute with water to 40 mL.

Analysis: To the *Standard solution* and the *Sample solution*, separately, add 1 mL of barium chloride TS.

Acceptance criteria: The turbidity produced in the *Sample solution*, after 3 min, is NMT that produced in the *Standard solution* (0.1%).

• **CHLORIDE AND SULFATE, Chloride (221)**

Standard solution: Transfer 0.5 mL of 0.02 N hydrochloric acid and 1.2 mL of nitric acid to a suitable container. Dilute with water to 50 mL.

Sample solution: Transfer 500 mg of Lithium Carbonate to a suitable container. Add 1.2 mL of nitric acid. Dilute with water to 50 mL.

Analysis: To the *Standard solution* and the *Sample solution*, separately, add 1 mL of silver nitrate TS.

Acceptance criteria: The turbidity produced in the *Sample solution* is NMT that produced in the *Standard solution* (0.07%).

SPECIFIC TESTS

• **LOSS ON DRYING (731)**

Analysis: Dry at 200° for 4 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Lithium Carbonate Capsules

DEFINITION

Lithium Carbonate Capsules contain NLT 95.0% and NMT 105.0% of the labeled amount of lithium carbonate (Li_2CO_3).

IDENTIFICATION

- **A.** A portion of the Capsule contents effervesces upon the addition of an acid, yielding a colorless gas that, when passed into calcium hydroxide TS, immediately forms a white precipitate.
- **B.** The emission intensity at 671 nm of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the Assay.

ASSAY

• **PROCEDURE**

Surfactant solution: 1%–2% (v/v) solution of nonionic surfactant such as t-dodecyl mercaptan ethoxylate or polyoxyethylene (20) sorbitan monolaurate in water

Blank: *Surfactant solution* and water (1:50)

Standard stock solution: 0.3 mg/mL of USP Lithium Carbonate RS prepared as follows. Transfer the required quantity of USP Lithium Carbonate RS to a suitable volumetric flask, and add water to 20% of the flask volume and hydrochloric acid to 0.5% of the flask volume. Shake until dissolved, and dilute with water to volume.

Standard solution: 0.006 mg/mL of USP Lithium Carbonate RS from *Standard stock solution* prepared as follows. Pipet a suitable volume of *Standard stock solution* into a suitable volumetric flask. Add water to 80% of the flask volume and *Surfactant solution* to 2% of the flask volume, and dilute with water to volume.

Sample stock solution: Nominally 0.6 mg/mL of lithium carbonate from the contents of NLT 20 Capsules prepared as follows. Transfer a portion of powder, equivalent to NLT 600 mg of lithium carbonate, into a suitable volumetric flask. Add water to 4% of the flask volume and hydrochloric acid to 0.5% of the flask volume, shake until the solid is well disintegrated, and dilute with water to volume.

Sample solution: Nominally 0.006 mg/mL of lithium carbonate from *Sample stock solution* prepared as follows. Pipet a suitable volume of *Sample stock solution* into a suitable volumetric flask. Add water to 80% of the flask volume and *Surfactant solution* to 2% of the flask volume, and dilute with water to volume.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: About 671 nm

Analysis

Samples: *Blank*, *Standard solution*, and *Sample solution*
Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of lithium carbonate (Li_2CO_3) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = emission response from the *Sample solution*
 r_S = emission response from the *Standard solution*
 C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Surfactant solution, Blank, and Standard solution:Prepare as directed in the *Assay*.

Sample solution: Pass the solution under test through a suitable filter. Transfer 20.0 mL of the filtrate to a 1000-mL volumetric flask. Add 500 mL of water, 1 drop of hydrochloric acid, and 20 mL of *Surfactant solution*. Dilute with water to volume.

Analysis

Samples: *Blank*, *Standard solution*, and *Sample solution*
Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution* and *Sample solution*.

Calculate percentage of the labeled amount of lithium carbonate (Li_2CO_3) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times D \times (1/L) \times 100$$

r_U = emission response from the *Sample solution*
 r_S = emission response from the *Standard solution*
 C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)
 V = volume of the *Medium*, 900 mL
 D = dilution factor
 L = label claim (mg/Capsule)

Tolerances: NLT 80% (Q) of the labeled amount of lithium carbonate (Li_2CO_3) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements**ADDITIONAL REQUIREMENTS**

• PACKAGING AND STORAGE: Preserve in well-closed containers. Store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Lithium Carbonate RS

Lithium Carbonate Tablets**DEFINITION**

Lithium Carbonate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of lithium carbonate (Li_2CO_3).

IDENTIFICATION

A portion of the powdered Tablets meets the requirements of the following tests.

- **A.** It effervesces upon the addition of an acid, yielding a colorless gas that, when passed into calcium hydroxide TS, immediately forms a white precipitate.
- **B.** The emission intensity at 671 nm of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Surfactant solution: 1%–2% solution of nonionic surfactant such as t-dodecyl mercaptan ethoxylate or polyoxyethylene (20) sorbitan monolaurate in water

Blank: *Surfactant solution* and water (1:50)

Standard solution: Transfer 30 mg of USP Lithium Carbonate RS to a 100-mL volumetric flask, and add 20 mL of water and 0.5 mL of hydrochloric acid. Shake until dissolved, and dilute with water to volume. Pipet 20 mL of the resulting solution into a 1000-mL volumetric flask, add 800 mL of water and 20 mL of a suitable surfactant solution, and dilute with water to volume.

Sample solution: Powder NLT 20 Tablets. Transfer a portion of powder, nominally equivalent to 600 mg of lithium carbonate, into a 1000-mL volumetric flask. Add 40 mL of water and 5 mL of hydrochloric acid, shake until the solid is well disintegrated, and dilute with water to volume. Pipet 10 mL of the resulting solution into a 1000-mL volumetric flask, add 800 mL of water and 20 mL of the surfactant solution, and dilute with water to volume.

Instrumental conditions

USP Lithium Carbonate RS

Lithium Carbonate Extended-Release Tablets

DEFINITION

Lithium Carbonate Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lithium carbonate (Li_2CO_3).

IDENTIFICATION

- **A.** A portion of powdered Tablets effervesces upon the addition of an acid, yielding a colorless gas that, when passed into calcium hydroxide TS, immediately forms a white precipitate.
- **B.** The emission intensity at 671 nm of the *Sample solution* corresponds to that of the *Standard solution* as obtained in the Assay.

ASSAY

PROCEDURE

Diluent: Dilute 5 mL of hydrochloric acid with water to 1 L.

Standard solution: 0.3 mg/mL of USP Lithium Carbonate RS in *Diluent* prepared as follows. Transfer a suitable quantity of USP Lithium Carbonate RS to an appropriate volumetric flask. Add water to 20% of the flask volume, and hydrochloric acid to 0.5% of the flask volume.

Shake until dissolved, and dilute with water to volume.
Sample stock solution: Nominally 12 mg/mL of lithium carbonate from a number of Tablets, nominally equivalent to NLT 1200 mg of lithium carbonate prepared as follows. Transfer the required number of Tablets to a suitable container. Add the required amount of *Diluent*. Shake until completely dissolved. Filter, and discard the first 25 mL. Use the remaining filtrate.

Sample solution: Nominally 0.3 mg/mL from *Sample stock solution* in *Diluent*

[NOTE—The *Standard solution* and *Sample solution* may be diluted quantitatively with *Diluent*, if necessary, to yield solutions of suitable concentrations adaptable to the linear or working range of the instrument.]

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: About 671 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Use the *Diluent* to zero the instrument. Measure the emission responses for the *Standard solution* and the *Sample solution*.

Calculate the percentage of labeled amount of lithium carbonate (Li_2CO_3) in the portion of Tablets:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times D \times 100$$

r_U = emission response from the *Sample solution*

r_S = emission response from the *Standard solution*

C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lithium carbonate in the *Sample solution* (mg/mL)

D = dilution factor, if needed

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Test 1

Medium: Dilute hydrochloric acid (7 in 1000); 800 mL

Apparatus 1: 100 rpm

Time: 15, 45, 90, and 120 min

Standard solution: USP Lithium Carbonate RS at a known concentration in *Medium*

Sample solution: At each time point i , withdraw 8.0 mL of the *Sample solution*, and pass through a filter of 35- μm or finer pore size. Use the filtrate as the *Sample solution*, suitably diluted with *Medium* if necessary.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: About 671 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Use the *Medium* to zero the instrument. Measure the emission responses for the *Standard solution* and the *Sample solution*.

Calculate the concentration, C_i , of lithium carbonate (Li_2CO_3) in *Medium* (mg/mL) at each time point i :

$$C_i = (r_U/r_S) \times C_S$$

r_U = emission response from the *Sample solution*

r_S = emission response from the *Standard solution*

C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)

Calculate the percentage of the labeled amount (Q) of lithium carbonate (Li_2CO_3) dissolved at each time point i :

$$\text{Result}_i = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_i = \{ \{ C_i \times [V - (i - 1) \times V_S] \} + [(C_{i-1} + C_{i-2} + \dots + C_1) \times V_S] \} \times (1/L) \times 100$$

C_i = concentration of lithium carbonate in *Medium* in the portion of sample withdrawn at time point i (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Capsule)

V_S = volume of the *Sample solution* withdrawn from the *Medium* (mL)

Tolerances: See Table 1.

Table 1

Time Point (i)	Time (min)	Amount Dissolved (%)
1	15	2–16
2	45	25–45
3	90	60–85
4	120	NLT 85

The percentages of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution (711)*.

Test 2: If the product complies with this procedure, the labeling indicates that it meets *USP Dissolution Test 2*.

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 1, 3, and 7 h

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Calculate the percentage of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at each time point as described in *Test 1*.

Tolerances: See *Table 2*.

Table 2

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 40
2	3	45–75
3	7	NLT 70

The percentages of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 3: If the product complies with this test, the labeling indicates that it meets *USP Dissolution Test 3*.

Medium: Water; 250 mL

Apparatus 3: 6 dips/min, 20-mesh top screen and 100-mesh bottom screen

Time: 1, 2, and 6 h

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Calculate the percentage of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at each time point as described in the *Test 1*.

Tolerances: See *Table 3*.

Table 3

Time Point (i)	Time (h)	Amount Dissolved (%)
1	1	10–45
2	2	25–75
3	6	NLT 70

The percentages of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 4: If the product complies with this procedure, the labeling indicates that it meets *USP Dissolution Test 4*.

Medium: Dilute hydrochloric acid (7 in 1000); 800 mL

Apparatus 1: 100 rpm

Time: 15, 45, 90, and 120 min

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Calculate the percentage of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at each time point as described in the *Test 1*.

Tolerances: See *Table 4*.

Table 4

Time Point (i)	Time (min)	Amount Dissolved (%)
1	15	NMT 15
2	45	20–45
3	90	50–80
4	120	NLT 70

The percentages of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

Test 5: If the product complies with this procedure, the labeling indicates that it meets *USP Dissolution Test 5*.

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 30, 90, and 150 min

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Calculate the percentage of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at each time point as described in the *Test 1*.

Tolerances: See *Table 5*.

Table 5

Time Point (i)	Time (min)	Amount Dissolved (%)
1	30	10–30
2	90	55–75
3	150	NLT 85%

The percentages of the labeled amount of lithium carbonate (Li_2CO_3) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* (711).

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. Protect from moisture. Store at controlled room temperature.

• **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

• **USP REFERENCE STANDARDS** (11)
USP Lithium Carbonate RS

Lithium Citrate

$\text{C}_6\text{H}_5\text{Li}_3\text{O}_7 \cdot 4\text{H}_2\text{O}$ 281.98

$\text{C}_6\text{H}_5\text{Li}_3\text{O}_7$ 209.93

1,2,3-Propanetricarboxylic acid, 2-hydroxy-trilithium salt tetrahydrate;

Trilithium citrate tetrahydrate [6080-58-6].

Anhydrous [919-16-4].

DEFINITION

Lithium Citrate contains NLT 98.0% and NMT 102.0% of lithium citrate ($\text{C}_6\text{H}_5\text{Li}_3\text{O}_7$), calculated on the anhydrous basis.

IDENTIFICATION

• **A.** The emission intensity at 671 nm of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

• **B. IDENTIFICATION TESTS—GENERAL, Citrate** (191): Meets the requirement

ASSAY

• PROCEDURE

Surfactant solution: 1%–2% solution of nonionic surfactant such as t-dodecyl mercaptan ethoxylate or polyoxyethylene (20) sorbitan monolaurate in water

Blank: *Surfactant solution* and water (1:50)

Standard stock solution: 0.3 mg/mL of USP Lithium Carbonate RS prepared as follows. Transfer the required quantity of USP Lithium Carbonate RS to a suitable volumetric flask, and add 20% of the flask volume of water and 0.5% of the flask volume of hydrochloric acid. Shake until dissolved, and dilute with water to volume.

Standard solution: 0.006 mg/mL of USP Lithium Carbonate RS from *Standard stock solution* prepared as fol-

lows. Pipet a suitable volume of *Standard stock solution* into a suitable volumetric flask. Add 80% of the flask volume of water and 2% of the flask volume of the *Surfactant solution*, and dilute with water to volume.

Sample stock solution: 0.8 mg/mL of Lithium Citrate prepared as follows. Transfer a suitable amount of Lithium Citrate to a suitable volumetric flask. Dissolve in water. Add 0.05% of the flask volume of hydrochloric acid. Dilute with water to volume.

Sample solution: Nominally 0.006 mg/mL of Lithium Citrate from *Sample stock solution* prepared as follows. Pipet a suitable volume of *Sample stock solution* into a suitable volumetric flask. Add 80% of the flask volume of water and 2% of the flask volume of the *Surfactant solution*, and dilute with water to volume.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: 671 nm

Analysis

Samples: *Blank*, *Standard solution*, and *Sample solution*. Use the *Blank* to zero the instrument. Measure the emission responses for the *Standard solution* and the *Sample solution*.

Calculate the percentage of lithium citrate ($C_6H_5Li_3O_7$) in the portion of Lithium Citrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times F \times 100$$

r_U = emission response of the *Sample solution*

r_S = emission response of the *Standard solution*

C_S = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)

C_U = concentration of Lithium Citrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous lithium citrate, 209.93

M_{r2} = molecular weight of lithium carbonate, 73.89

F = ratio of the number of moles of lithium in 1 mol of lithium carbonate to that of the number of moles of lithium in 1 mol of lithium citrate, 0.66

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

Delete the following:

• HEAVY METALS (231)

Test preparation: Dissolve 2.0 g of Lithium Citrate in 2 mL of 0.1 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

• CARBONATE

Analysis: Add 0.5 g of Lithium Citrate to 5 mL of 6 N acetic acid.

Acceptance criteria: NMT a slight effervescence is produced.

• PH (791)

Sample solution: 50-mg/mL solution of Lithium Citrate in water

Acceptance criteria: 7.0–10.0

• WATER DETERMINATION, Method III (921)

Analysis: Dry a sample at 150° for 3 h.

Acceptance criteria: 24.0%–28.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Lithium Carbonate RS

Lithium Hydroxide

LiOH · H₂O

41.96

LiOH

23.95

Lithium hydroxide monohydrate [1310-66-3].

Anhydrous [1310-65-2].

DEFINITION

Lithium Hydroxide contains NLT 98.0% and NMT 102.0% of lithium hydroxide (LiOH), calculated on the anhydrous basis.

[CAUTION]—Exercise great care in handling Lithium Hydroxide, as it rapidly destroys tissues.]

IDENTIFICATION

• **A.** When moistened with hydrochloric acid, it imparts an intense crimson color to a nonluminous flame.

ASSAY

• PROCEDURE

Sample solution: Nominally equivalent to 10 mg/mL of anhydrous lithium hydroxide from Lithium Hydroxide in carbon dioxide-free water

Analysis

Preliminary titration: Pipet 50 mL of the *Sample solution* into a 250-mL conical flask. Start the titration by adding 35 mL of 0.5 N hydrochloric acid VS with continuous vigorous stirring. Add 20 mL of 1 N barium chloride and 3 drops of phenolphthalein TS, and allow to stand for 2 min. Continue the titration with 0.5 N hydrochloric acid VS. At the discharge of the pink color of the indicator, record the volume of acid solution consumed.

Final titration: Pipet 50 mL of the *Sample solution* into a 250-mL conical flask. While pipeting and during the subsequent titrations, keep the contents of the flask blanketed with a stream of carbon dioxide-free air. Start the titration by adding with continuous vigorous swirling a volume of 0.5 N hydrochloric acid VS that is 0.50 mL less than that consumed in the preliminary titration. Add 20 mL of 1 N barium chloride and 3 drops of phenolphthalein TS, and allow to stand for 2 min. Rinse the sides of the flask with carbon dioxide-free water, and continue the titration with 0.1 N hydrochloric acid VS. At the discharge of the pink color of the indicator, record the volume of acid solution consumed. Each mL of 0.5 N hydrochloric acid VS and 0.1 N hydrochloric acid VS is equivalent to 11.975 and 2.395 mg of total alkali, respectively, calculated as lithium hydroxide (LiOH).

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

• CHLORIDE AND SULFATE, Sulfate (221)

Sample: 2.0 g

Acceptance criteria: It shows no more sulfate than corresponds to 1.0 mL of 0.020 N sulfuric acid (0.05%).

• CALCIUM

Sample solution: Dissolve 3.33 g in 50 mL of 3 N hydrochloric acid. Boil the clear solution to expel carbon dioxide, add 5 mL of ammonium oxalate TS, render al-

kaline with 6 N ammonium hydroxide, and allow to stand for 4 h. Pass through a filtering crucible, and wash with warm water until the last washing yields no turbidity with calcium chloride TS. Place the crucible in a beaker, cover it with water, add 3 mL of sulfuric acid, and heat to 70°.

Analysis: Titrate the *Sample solution* with 0.10 N potassium permanganate to a pale pink color that persists for 30 s.

Acceptance criteria: NMT 3.34 mL of 0.10 N potassium permanganate is consumed (0.20%).

• CARBONATE

[NOTE—While pipeting and during the subsequent titrations, keep the contents of the flasks blanketed with a stream of carbon dioxide-free air.]

Analysis: To the flask containing the completed *Final titration* obtained in the *Assay*, add 1 drop of methyl orange TS. Titrate with 0.1 N hydrochloric acid VS until a persistent orange color is produced and no undissolved barium carbonate remains. Perform a blank titration to determine the volume of 0.1 N hydrochloric acid consumed in going from the phenolphthalein endpoint to the methyl orange endpoint. To 100 mL of carbon dioxide-free water in a 250-mL conical flask, add 3 drops of the *Sample solution* from the *Assay*, 20 mL of 1 N barium chloride, and 3 drops of phenolphthalein TS. Allow to stand for 2 min. Titrate this solution with 0.1 N hydrochloric acid. At the discharge of the pink color of the indicator, add 1 drop of methyl orange TS, and titrate with 0.1 N hydrochloric acid VS until a persistent orange color is produced.

Acceptance criteria: The titration shows no more carbon dioxide than corresponds to 1.5 mL of 0.10 N hydrochloric acid (0.7%).

Delete the following:

• HEAVY METALS, Method I (231)

Sample solution: Dissolve 1.0 g in 15 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

SPECIFIC TESTS

• LITHIUM CONTENT

Standard stock solution: 0.3 mg/mL of USP Lithium Carbonate RS prepared as follows. Dissolve first in water using 20% final volume and hydrochloric acid using 0.5% of final volume. Dilute with water to volume.

Standard solution: 6.0 µg/mL of USP Lithium Carbonate RS from the *Standard stock solution* prepared as follows. Pipet a volume of the *Standard stock solution* into a suitable volumetric flask, add water to fill 80% of final volume, and a suitable surfactant solution to fill 2% of final volume. Dilute with water to volume. Measure the pH.

Sample stock solution: 0.4 mg/mL of Lithium Hydroxide in water

Sample solution: Pipet 20 mL of the *Sample stock solution* into a 1000-mL volumetric flask. Add 950 mL of water, 2 mL of 1 N hydrochloric acid, and 20 mL of a surfactant solution, and mix. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to the same pH (±0.1 pH unit) as that of the *Standard solution*, and dilute with water to volume.

Instrumental conditions

Mode: Flame photometry

Analytical wavelength: 671 nm. Adjust the instrument with the surfactant solution.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of lithium (Li) in the portion of Lithium Hydroxide taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (A_r/M_r) \times F \times 100$$

r_u = photometric reading of the *Sample solution*
 r_s = photometric reading of the *Standard solution*
 C_s = concentration of USP Lithium Carbonate RS in the *Standard solution* (mg/mL)
 C_u = concentration of Lithium Hydroxide in the *Sample solution* (mg/mL)
 A_r = atomic weight of lithium, 6.94
 M_r = molecular weight of lithium carbonate, 73.89
 F = number of lithium ions per mole of lithium carbonate, 2

Acceptance criteria: 28.1%–29.9% on the anhydrous basis

• WATER DETERMINATION, Method III (921)

Analysis: Dry at 135° at a pressure of NMT 5 mm of mercury for 1 h.

Acceptance criteria: 41.0%–43.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Lithium Carbonate RS

Lomustine

$C_9H_{16}ClN_3O_2$ 233.70
 Urea, N-(2-chloroethyl)-N'-cyclohexyl-N-nitroso-;
 1-(2-Chloroethyl)-3-cyclohexyl-1-nitrosourea [13010-47-4].

DEFINITION

Lomustine contains NLT 97% and NMT 103% of lomustine ($C_9H_{16}ClN_3O_2$), calculated on the as-is basis.

[CAUTION—Great care should be taken to prevent inhalation of particles of lomustine and to prevent exposure to the skin.]

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

[NOTE—Protect the solutions from light. Use freshly prepared solutions.]

Mobile phase: Acetonitrile and water (35:65)

Standard solution: 0.2 mg/mL of USP Lomustine RS in acetonitrile

Sample solution: 0.2 mg/mL of Lomustine in acetonitrile

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column:** 4.6-mm × 75-mm; 3-μm packing L1**Flow rate:** 1.5 mL/min**Injection volume:** 10 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 1.0%**Tailing factor:** NMT 1.3**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of lomustine ($C_9H_{16}ClN_3O_2$) in the portion of Lomustine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Lomustine RS in the *Standard solution* (mg/mL) C_U = concentration of Lomustine in the *Sample solution* (mg/mL)**Acceptance criteria:** 97%–103% on the as-is basis**IMPURITIES****Delete the following:**• **HEAVY METALS****Magnesium sulfate solution:** 250 mg/mL of magnesium sulfate in 2 N sulfuric acid**Lead nitrate stock solution and Standard lead solution:** Prepare as directed in *Heavy Metals* (231), *Special Reagents*.**Standard solution:** Transfer 4.0 mL of *Standard lead solution* into a 50-mL color-comparison tube, and dilute with water to 25 mL.

Sample solution: Transfer 2.0 g of Lomustine to a 50-mL silica crucible. Add 4 mL of *Magnesium sulfate solution*, and mix using a thin glass rod. Place the crucible on a steam bath, and heat cautiously until charring begins. Then place the crucible on a hot plate, and continue the charring. When the charring is complete, carry out the ignition at a temperature not exceeding 800° until an almost white or a mostly grayish residue is obtained. Allow to cool, and moisten the residue with 0.5 mL of 2 N hydrochloric acid, evaporate, ignite again, and allow to cool. The total period of ignition must not exceed 2 h. Dissolve the residue in two portions, 5 mL each, of 2 N hydrochloric acid. Add 0.1 mL of phenolphthalein TS, followed by ammonium hydroxide, until a pink color is obtained. Cool, add glacial acetic acid until the solution is decolorized, then add an additional 0.5 mL of glacial acetic acid. Filter if necessary, dilute with water to 20 mL, and quantitatively transfer this solution into a 50-mL color-comparison tube.

Analysis**Samples:** *Standard solution* and *Sample solution*

Adjust with either 1 N acetic acid or 6 N ammonium hydroxide to a pH of between 3.0 and 4.0 using litmus paper. Dilute with water to 40 mL. Add 1.2 mL of thioacetamide–glycerin base TS, and dilute with water to volume. Allow to stand for 2 min, and view downward over a white surface.

Acceptance criteria: NMT 20 μg/g; any brown color in the *Sample solution* is not more intense than that in the *Standard solution*. • (Official 1-Jan-2018)• **ORGANIC IMPURITIES**

Loperamide Hydrochloride

$C_{29}H_{33}ClN_2O_2 \cdot HCl$ 513.50

1-Piperidinebutanamide, 4-(4-chlorophenyl)-4-hydroxy-*N,N*-dimethyl- α,α -diphenyl-, monohydrochloride.

4-(*p*-Chlorophenyl)-4-hydroxy-*N,N*-dimethyl- α,α -diphenyl-1-piperidinebutanamide monohydrochloride [34552-83-5].

» Loperamide Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of $C_{29}H_{33}ClN_2O_2 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Loperamide Hydrochloride RS

Identification—

A: *Infrared Absorption* (197K).

B: Transfer about 40 mg, accurately weighed, to a 100-mL volumetric flask, dissolve in about 50 mL of isopropyl alcohol, add 10 mL of 0.1 N hydrochloric acid, dilute with isopropyl alcohol to volume, and mix: the UV absorption spectrum between 250 and 300 nm of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Loperamide Hydrochloride RS, concomitantly measured.

Loss on drying (731)—Dry it in vacuum at 80° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.2%.

Delete the following:

• **Heavy metals, Method II** (231): 0.002%. • (Official 1-Jan-2018)

Chromatographic purity—Prepare a test solution in chloroform containing 10 mg per mL. Apply 10 μ L of this solution and 10 μ L of a Standard solution of USP Loperamide Hydrochloride RS in chloroform containing 10 mg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and formic acid (85:10:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the plate to air-dry. Locate the spots on the plate by exposing it to fumes of iodine: the spot obtained from the test solution corresponds in R_f value, color, and intensity to that obtained from the Standard solution, and no secondary spots are observed.

Chloride content—Using about 13 mg, accurately weighed, proceed as directed under *Oxygen Flask Combustion* (471), using a mixture of 10 mL of 0.02 N sodium hydroxide and 2 drops of 30 percent hydrogen peroxide as the absorbing liquid. When combustion is complete and the combustion gases absorbed, rinse the stopper, sample holder, and inner walls of the flask with 50 mL of isopropyl alcohol. Add 4 mL of 0.1 N nitric acid, and titrate with 0.01 N mercuric nitrate VS, using diphenylcarbazone TS as the indicator. Each mL of 0.01 N mercuric nitrate is equivalent to 0.3545 mg of chlorine: between 13.52% and 14.20% is found.

Assay—

Neutralized acetic acid—Dissolve 10 mg of α -naphtholbenzein in 100 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid to a green endpoint, disregarding the amount of titrant consumed.

Procedure—Dissolve about 375 mg, accurately weighed, of Loperamide Hydrochloride in 25 mL of *Neutralized acetic acid*. Add 10 mL of mercuric acetate solution (prepared by dissolving 1 g of mercuric acetate in 33 mL of *Neutralized acetic acid*) and titrate with 0.1 N perchloric acid VS to the original green color of the *Neutralized acetic acid*. Each mL of 0.1 N perchloric acid is equivalent to 51.35 mg of $C_{29}H_{33}ClN_2O_2 \cdot HCl$.

Loperamide Hydrochloride Capsules

» Loperamide Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Loperamide Hydrochloride RS

Identification—

A: *Thin-Layer Chromatographic Identification Test* (201)—

Test solution—Transfer a quantity of the contents of the Capsules, equivalent to about 10 mg of loperamide hydrochloride, to a 37-mL stoppered vial, add 10 mL of methanol, shake for 5 minutes, and filter.

Standard solution: a solution of USP Loperamide Hydrochloride RS in methanol containing about 10 mg per mL.

Application volume: 10 μ L of the *Test solution* and 1 μ L of the *Standard solution*.

Developing solvent system: a mixture of chloroform, methanol, and formic acid (85:10:5).

Procedure—Proceed as directed in the chapter. Visualize the spots by exposing to iodine vapors.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: pH 4.7 acetate buffer, prepared by mixing 200 mL of 1 N acetic acid with 600 mL of water, adjusting with 1 N sodium hydroxide to a pH of 4.70 ± 0.05 , diluting with water to 1000 mL, and mixing; 500 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Determine the amount of loperamide hydrochloride dissolved using the following method.

Mobile phase and Chromatographic system—Proceed as directed in the *Assay*.

Procedure—Inject a volume (about 50 μ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{29}H_{33}ClN_2O_2 \cdot HCl$ dissolved in comparison with a *Standard solution* having a known concentration of USP Loperamide Hydrochloride RS in the same medium and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{29}H_{33}ClN_2O_2 \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Transfer 500 mL of acetonitrile to a 1000-mL volumetric flask. Dilute with water to volume, add 20 drops of phosphoric acid, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Loperamide Hydrochloride RS in a mixture of acetonitrile and 0.5 N hydrochloric acid (1:1) to obtain a solution having a known concentration of about 0.2 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with a mixture of acetonitrile and water (1:1) to volume, and mix to obtain a solution having a known concentration of about 10 μ g per mL.

Assay preparation—Transfer, as completely as possible, the contents of not less than 20 Capsules to a suitable tared container, and determine the average weight per capsule. Mix the combined contents, and transfer an accurately weighed portion of the powder, equivalent to about 20 mg of loperamide hydrochloride, to a 100-mL volumetric flask. Add about 35 mL of 0.5 N hydrochloric acid and sonicate for 15 minutes. Add 35 mL of acetonitrile and sonicate for an additional 15 minutes. Dilute with a mixture of acetonitrile and 0.5 N hydrochloric acid (1:1) to volume, mix, and filter. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with a mixture of acetonitrile and water (1:1) to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4-mm \times 25-cm column that contains 10- μ m packing L10. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency, N , determined from the analyte peak is not less than 1900 theoretical plates, the capacity factor, K' , is not less than 3.5, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{29}H_{33}ClN_2O_2 \cdot HCl$ in the portion of Capsules taken by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Loperamide Hydrochloride RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Loperamide Hydrochloride Oral Solution

DEFINITION

Loperamide Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: Transfer a volume of Oral Solution containing a suitable amount of loperamide hydrochloride (typically 12–24 mg) to a separator containing about 100 mL of water and 1 mL of 50% sodium hydroxide solution, and gently swirl the contents. Add 50 mL of methylene chloride, shake gently by hand, releasing pressure often, and then shake by mechanical means for 20 min. Allow the layers to separate. Transfer the lower methylene chloride layer to a separator containing 100 mL of water. Shake gently by hand, releasing pressure often, and then shake by mechanical means for 10 min. Allow the layers to separate. Transfer the lower methylene chloride layer to a 250-mL beaker, and evaporate to dryness on a steam bath with the aid of a current of air. Add 10 mL of methanol and 500 mg of potassium bromide to the beaker. Evaporate to dryness on a steam bath with the aid of a current of air, and use the residue.

Acceptance criteria: The spectrum obtained from the *Sample* shows bands at approximately 3400 cm^{-1} , 2929 cm^{-1} , 1624 cm^{-1} , and 1493 cm^{-1} , similar to the spectrum from a *Standard* similarly obtained.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 3.0 g/L of monobasic potassium phosphate in water

Mobile phase: Acetonitrile and *Buffer* (37:63), adjusted with 5% phosphoric acid to a pH of 3.0

Standard stock solution: Prepare 2 mg/mL of USP Loperamide Hydrochloride RS in methanol. Dilute this solution with water to obtain a 0.1-mg/mL solution.

Standard solution: 0.01 mg/mL of USP Loperamide Hydrochloride RS in *Mobile phase* from the *Standard stock solution*

Sample solution: Nominally 0.01 mg/mL of loperamide hydrochloride from Oral Solution, prepared as follows. Transfer a volume of Oral Solution, equivalent to about 1.0 mg of loperamide hydrochloride, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, mix, and filter.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 214 nm**Column:** 4.0-mm × 8.0-cm; 5-μm packing L7, 4.6-mm × 7.5-cm; 3.5-μm packing L7, or 4.6-mm × 12.5-cm; 5-μm packing L7**Flow rate:** 1.5 mL/min**Injection volume:** 10 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Tailing factor:** NMT 2.0**Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak area from the *Sample solution* r_S = peak area from the *Standard solution* C_S = concentration of USP Loperamide Hydrochloride RS in the *Standard solution* (mg/mL) C_U = nominal concentration of loperamide hydrochloride in the *Sample solution* (mg/mL)**Acceptance criteria:** 90.0%–110.0%**OTHER COMPONENTS**

- ALCOHOL DETERMINATION, Method II (611)** (if present): 90.0%–110.0% of the labeled amount of alcohol (C_2H_5OH)

PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS (905)**
For single-unit containers
Acceptance criteria: Meets the requirements
- DELIVERABLE VOLUME (698)**
For multiple-unit containers
Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- PH (791):** 2.7–6.5

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store below 40°, preferably between 15° and 30°, unless otherwise specified by the manufacturer.
- USP REFERENCE STANDARDS (11)**
USP Loperamide Hydrochloride RS

Loperamide Hydrochloride Tablets**DEFINITION**Loperamide Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$).**IDENTIFICATION**

- A. ULTRAVIOLET ABSORPTION (197U)**
[NOTE—This procedure is not applicable for Tablets labeled as chewable.]
Wavelength range: 250–300 nm
Standard solution: About 0.4 mg/mL of USP Loperamide Hydrochloride RS, prepared as follows. Transfer an amount of USP Loperamide Hydrochloride RS to a suitable volumetric flask, dissolve first in isopropyl alcohol, using 50% of the final volume. Add 0.1 N hydro-

chloric acid equivalent to 10% of the final volume, and dilute with isopropyl alcohol to volume.

Sample solution: Transfer a quantity of finely powdered Tablets equivalent to about 10 mg of loperamide hydrochloride to a test tube. Add 20.0 mL of isopropyl alcohol, shake by mechanical means for 1 min, and allow to settle. Pipet 9.0 mL of the supernatant into a 10-mL volumetric flask, and dilute with 0.1 N hydrochloric acid to volume.**Acceptance criteria:** The spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*, concomitantly measured.**THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

[NOTE—For Tablets labeled as chewable, use the following procedure.]

Standard solution: 1.0 mg/mL of USP Loperamide Hydrochloride RS in methanol**Sample solution:** Grind a number of Tablets, equivalent to 10 mg of loperamide hydrochloride, with 10 mL of methanol for about 2 min. Centrifuge the mixture, and use the supernatant.**Application volume:** 10 μL**Developing solvent system:** Chloroform, methanol, and formic acid (75:25:1)**Analysis:** Visualize the spots by using Dragendorff's TS.**Acceptance criteria:** Meet the requirements

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY**PROCEDURE****Solvent mixture:** Methanol and acetonitrile (3:1)**Ion pairing solution:** Solution containing 2.35 g/L of sodium 1-hexanesulfonate and 2.88 g/L of monobasic ammonium phosphate in water, adjusted with phosphoric acid to a pH of 3.2**Mobile phase:** *Solvent mixture* and *Ion pairing solution* (55:45)**System suitability solution:** 0.2 mg/mL of USP Loperamide Hydrochloride RS and 0.002 mg/mL of USP Loperamide Related Compound F RS in *Mobile phase***Standard solution:** 0.2 mg/mL of USP Loperamide Hydrochloride RS in *Mobile phase***Sample solution:** Fill a 100-mL volumetric flask with *Mobile phase*. Immediately transfer a number of Tablets equivalent to 20 mg of loperamide hydrochloride to the flask, and cap tightly. Sonicate for 15–30 min with intermittent shaking. Allow the contents to settle, and use a clear supernatant.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 219 nm**Column:** 3.9-mm × 15-cm; 5-μm or 10-μm packing L1**Flow rate:** 2 mL/min**Injection volume:** 50 μL**System suitability****Samples:** *System suitability solution* and *Standard solution***Suitability requirements****Resolution:** NLT 3.0 between loperamide and loperamide related compound F, *System suitability solution***Tailing factor:** NMT 2.0 for both peaks, *System suitability solution***Relative standard deviation:** NMT 2.0%, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Loperamide Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of loperamide hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: USP Loperamide Hydrochloride RS at a known concentration in *Medium*. [NOTE—If necessary, dissolve USP Loperamide Hydrochloride RS in a minimal amount of methanol, and then dilute with *Medium* to final concentration.]

Sample solution: Filtered solution under test

Buffer: Transfer 3.0 g of triethylamine hydrochloride and 1.0 mL of phosphoric acid to a 1-L flask, and add 550 mL of water.

Mobile phase: Acetonitrile and Buffer (45:55)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 214 nm

Column: 4.6-mm × 7.5-cm; 3.5-μm packing L7 or 4.6-mm × 12.5-cm; 5-μm packing L7

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of loperamide hydrochloride ($C_{29}H_{33}ClN_2O_2 \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Solvent mixture, Ion pairing solution, Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.002 mg/mL of USP Loperamide Related Compound F RS in *Mobile phase*

System suitability

Sample: *System suitability solution*

Suitability requirements

Resolution: NLT 3.0 between loperamide and loperamide related compound F

Tailing factor: NMT 2.0 for both peaks

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of loperamide N-oxide in the portion of Tablets taken:

$$\text{Result} = (r_T/r_S) \times (C_S/C_U) \times 100$$

r_T = sum of the peak responses of the *cis* and *trans* isomers of N-oxide from the *Sample solution*

r_S = peak response of loperamide related compound F from the *Standard solution*

C_S = concentration of USP Loperamide Related Compound F RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of loperamide hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Loperamide	1.0	—
Loperamide <i>trans</i> -N-oxide (loperamide related compound F)	1.5	2.0 ^a
Loperamide <i>cis</i> -N-oxide ^b	1.7	

^a For the sum of *trans* and *cis*-isomers.

^b (1*S*,4*R*)-4-(4-Chlorophenyl)-1-[4-(dimethylamino)-4-oxo-3,3-diphenylbutyl]-4-hydroxypiperidine 1-oxide.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** Label chewable Tablets to indicate that they are to be chewed before swallowing.
- **USP REFERENCE STANDARDS (11)**
 - USP Loperamide Hydrochloride RS
 - USP Loperamide Related Compound F RS
 - Loperamide *trans*-N-oxide; (1*R*,4*S*)-4-(4-Chlorophenyl)-1-[4-(dimethylamino)-4-oxo-3,3-diphenylbutyl]-4-hydroxypiperidine 1-oxide. $C_{29}H_{33}ClN_2O_3$ 493.04

Lopinavir

$C_{37}H_{48}N_4O_5$ 628.80
 [1*S*-(1*R**(*R**),3*R**,4*R**)]-N-[4[(2,6-Dimethylphenoxy)acetyl]amino]-3-hydroxy-5-phenyl-1-(phenylmethyl)pentyl]-tetrahydro-α-(1-methylethyl)-2-oxo-1(2*H*)-pyrimidineacetamide;
 (α*S*)-Tetrahydro-N-[(α*S*)-α-[(2*S*,3*S*)-2-hydroxy-4-phenyl-3-[2-(2,6-xylyloxy)acetamido]butyl]phenethyl]-α-isopropyl-2-oxo-1(2*H*)-pyrimidineacetamide [192725-17-0].

DEFINITION

Lopinavir contains NLT 98.0% and NMT 102.0% of lopinavir ($C_{37}H_{48}N_4O_5$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197A)**
- **B.** The retention time of the lopinavir peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: 2.7 g/L of monobasic potassium phosphate and 0.9 g/L of dibasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 6.0. Pass the solution through a suitable filter of 0.45- μ m pore size.

Diluent: Acetonitrile and water (1:1)

Solution A: Acetonitrile and *Buffer* (9:11)

Mobile phase: *Solution A*

ⁿ (S)-*N*-[(2*S*,4*R*,5*S*)-5-[2-(2,6-Dimethylphenoxy)acetamido]-4-hydroxy-1,6-diphenylhexan-2-yl]-3-methyl-2-[2-oxotetrahydropyrimidin-1(2*H*)-yl]butanamide.

• ORGANIC IMPURITIES: PROCEDURE 2

[NOTE—For late-eluting impurities.]

Buffer, Diluent, and Solution A: Prepare as directed in the Assay.

Solution B: Acetonitrile and Buffer (3:1)

Mobile phase: Solution A and Solution B (3:7)

System suitability solution: 0.5 mg/mL of USP

Lopinavir System Suitability Mixture RS in Diluent

Standard solution: 0.005 mg/mL of USP Lopinavir RS in Diluent

Sample solution: 0.5 mg/mL in Diluent

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 25-cm; 4-μm packing L1

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: 50 min

System suitability

Sample: Standard solution

[NOTE—The relative retention times are listed in Table 3.]

Suitability requirements

Capacity factor: NLT 1.5

Column efficiency: NLT 3000

Tailing factor: 0.8–1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: Diluent, System suitability solution, Standard solution, and Sample solution

Calculate the percentage of each lopinavir related impurity and unidentified impurity in the portion of Lopinavir taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of lopinavir from the Standard solution

C_S = concentration of USP Lopinavir RS in the Standard solution (mg/mL)

C_U = concentration of Lopinavir in the Sample solution (mg/mL)

F = relative response factor (see Table 3)

Table 3

Name	Relative Retention	Relative Response Factor	Acceptance Criteria, NMT (%)
Lopinavir	1.00	—	—
Lopinavir <i>O</i> -acyl ^a	1.49	0.77	0.1

^g Exclude from Organic Impurities, Procedure 2, lopinavir (4R) epimer and any other peak eluting prior to this peak because these are already monitored in Procedure 1.

Acceptance criteria: See Table 2 and Table 3.

SPECIFIC TESTS

- **WATER DETERMINATION**, Method I (921): NMT 4.4%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in tight containers. Store at room temperature.
- **USP REFERENCE STANDARDS (11)**
 - USP Lopinavir RS
 - USP Lopinavir System Suitability Mixture RS
 - Lopinavir System Suitability Mixture contains lopinavir N-formylphenoxyacetamide, lopinavir N-acetylphenoxyacetamide, and several other minor components. Lopinavir N-formylphenoxyacetamide is (2-(2,6-dimethylphenoxy)-N-[(2S,3S,5S)-5-formamido-3-hydroxy-1,6-diphenylhexan-2-yl]acetamide. $C_{29}H_{34}N_2O_4$ 474.59
 - Lopinavir N-acetylphenoxyacetamide is (N-[(2S,3S,5S)-5-acetamido-3-hydroxy-1,6-diphenylhexan-2-yl]-2-(2,6-dimethylphenoxy)acetamide. $C_{30}H_{36}N_2O_4$ 488.62

Lopinavir and Ritonavir Oral Solution

DEFINITION

Lopinavir and Ritonavir Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amounts of lopinavir ($C_{37}H_{48}N_4O_5$) and ritonavir ($C_{37}H_{48}N_6O_5S_2$).

IDENTIFICATION

- **A.** The retention times of the lopinavir and ritonavir peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY

• LOPINAVIR AND RITONAVIR

Buffer: 4.1 g/L of monobasic potassium phosphate in water

Solution A: Acetonitrile and *Buffer* (65:35)

Solution B: Acetonitrile and *Buffer* (50:50)

Mobile phase: Acetonitrile, methanol, tetrahydrofuran, and *Buffer* (175:100:100:625). Separately filter the *Buffer* and the premixed solvents before combining them to make the *Mobile phase*.

Standard stock solution: 0.1 mg/mL each of USP

Lopinavir RS and USP Ritonavir RS in *Solution B*

Standard solution: 0.025 mg/mL each of USP Lopinavir RS and USP Ritonavir RS in *Solution B* from the *Standard stock solution*

Sample stock solution: Nominally 4 mg/mL of lopinavir and 1 mg/mL of ritonavir in *Solution A* prepared as follows. Transfer a volume of Oral Solution equivalent to 400 mg of lopinavir and 100 mg of ritonavir to a 100-mL volumetric flask with the aid of several small portions of *Solution A*, and then dilute with *Solution A* to volume.

Sample solution: Nominally 0.05 mg/mL of lopinavir and 0.0125 mg/mL of ritonavir in *Solution B* from the *Sample stock solution*

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.2 for the ritonavir peak

Relative standard deviation: NMT 2.0% each for ritonavir and lopinavir

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentages of the labeled amounts of lopinavir ($C_{37}H_{48}N_4O_5$) and ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of the corresponding analyte from the *Sample solution*

r_S = peak response of the corresponding analyte from the *Standard solution*

C_S = concentration of USP Lopinavir RS or USP Ritonavir RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lopinavir or ritonavir in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0% of the labeled amounts of lopinavir ($C_{37}H_{48}N_4O_5$) and ritonavir ($C_{37}H_{48}N_6O_5S_2$)

PERFORMANCE TESTS• **DELIVERABLE VOLUME** (698)

For multiple-unit containers

Acceptance criteria: Meets the requirements

IMPURITIES• **ORGANIC IMPURITIES****Buffer A:** 4.1 g/L of monobasic potassium phosphate in water**Buffer B:** 3.8 g/L of monobasic potassium phosphate and 0.25 g/L of dibasic potassium phosphate in water**Solution A:** Acetonitrile and *Buffer A* (50:50)**Solution B:** Acetonitrile, butyl alcohol, and *Buffer A* (15:5:80)**Solution C:** Acetonitrile and *Buffer A* (65:35)**Mobile phase:** Acetonitrile, tetrahydrofuran, butyl alcohol, and *Buffer B* (18:8:5:69). Adjust with 1 M phosphoric acid or 1 M potassium hydroxide, if necessary, to a pH of 6.3.**Standard stock solution:** 0.1 mg/mL each of USP Lopinavir RS and USP Ritonavir RS in *Solution A***Standard solution:** 0.01 mg/mL each of USP Lopinavir RS and USP Ritonavir RS from *Standard stock solution* in *Solution B***Peak identification solution:** Transfer a weighed portion of Oral Solution to a crimp-top container. Add an amount of citric acid equivalent to 1% by weight of the Oral Solution taken and mix until dissolved. Seal the container, and heat at 50° for approximately 4 days. Use this degradation solution and follow the procedure described below in the *Sample stock solution* and *Sample solution* sections to prepare the *Peak identification solution*.**Sample stock solution:** Transfer 5 mL of Oral Solution with the aid of several small portions of *Solution C* to a 100-mL volumetric flask, and dilute with *Solution C* to volume.**Sample solution:** Dilute 25.0 mL of *Sample stock solution* with *Solution B* to 50.0 mL. Transfer 15.0 mL of this solution to a 50-mL centrifuge tube that has been previously rinsed with methanol and dried. Add 20.0 mL of *n*-heptane, and shake vigorously until a uniform emulsion is formed. Vent the tube periodically while shaking. Centrifuge the emulsion for about 5 min. Carefully remove the top heptane layer by aspiration, leaving the clear *Sample solution* layer. The middle viscous, cloudy layer should be considered part of the heptane layer for removal by aspiration. Precondition a strong anion-exchange cartridge (quaternary ammonium functionality on a styrene/divinylbenzene base) with a sorbent mass of 600 mg by rinsing the cartridge with 3 mL of methanol, then 3 mL of *Solution C*, and repeating these rinse steps. Dry the cartridge for about 10 min with the aid of a low vacuum. Transfer 5.0 mL of the clear *Sample*solution to the preconditioned cartridge. With the aid of a vacuum, slowly pass the *Sample solution* completely through the cartridge, collect the extract in a 5-mL volumetric flask, and then dilute with *Solution C* to volume.**Chromatographic system**(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 215 nm and 240 nm**Column:** 4.6-mm × 15-cm; 3-μm packing L26**Column temperature:** 60°**Flow rate:** 1 mL/min**Injection volume:** 50 μL**Run time:** 2 times the retention time of lopinavir**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 2.5 between the ritonavir and lopinavir peaks at 215 nm**Tailing factor:** 0.8–1.2 for the ritonavir peak at 240 nm**Relative standard deviation:** NMT 3.0% for the lopinavir peak at 215 nm; NMT 3.0% for the ritonavir peak at 240 nm**Analysis****Samples:** *Standard solution*, *Peak identification solution*, and *Sample solution*[NOTE—Determine the relative retention values (*r*) for the components listed in *Table 1* and *Table 2*, using the time measured at the first baseline deflection of the *Standard solution* chromatogram as the void volume (*t_M*).]To identify the ritonavir impurities, determine the relative retention value from the 240-nm chromatogram relative to ritonavir (see *Table 1*). The *Peak identification solution* may also be used to identify ritonavir degradants. Unspecified ritonavir impurities are assigned according to the algorithm outlined in *Table 3*. Calculate the percentage of each ritonavir impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of each individual impurity from the *Sample solution**r_s* = peak response of ritonavir from the *Standard solution**C_s* = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)*C_u* = nominal concentration of ritonavir in the *Sample solution* (mg/mL)*F* = relative response factor (see *Table 1*)Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Value (r)	Relative Response Factor	Acceptance Criteria, NMT (%)

^m Thiazol-5-ylmethyl (2S,3S,5S)-5-[(S)-2-{3-[(2-ethylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.

ⁿ (4S,5S)-Thiazol-5-ylmethyl 4-benzyl-5-[(S)-2-[(S)-4-isopropyl-2,5-dioximidazolidin-1-yl]-3-phenylpropyl]-2-oxooxazolidine-3-carboxylate.

^o Thiazol-5-ylmethyl (2S,3S,5S)-5-[(S)-2-{3-[(2-ethylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.

^p (S)-[(2S,3S,5S)-5-Amino-1,6-diphenyl-2-[(thiazol-5-ylmethoxy)carbonylamino]hexan-3-yl] 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.

^q Thiazol-5-ylmethyl (2S,3S,5S)-5-(t-butoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.

^r Thiazol-5-ylmethyl (2S,3S,5S)-5-(isobutoxycarbonylamino)-3-hydroxy-1,6-diphenylhexan-2-ylcarbamate.

^s (S)-N-[(S)-1-[(4S,5S)-4-Benzyl-2-oxooxazolidin-5-yl]-3-phenylpropan-2-yl]-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamide.

^t (S)-Isobutyl 2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanoate.

^u Thiazol-5-ylmethyl (2S,4S,5S)-4-hydroxy-5-[(S)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.

^v Thiazol-5-ylmethyl (2S,3R,5S)-3-hydroxy-5-[(S)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.

^w Bis(thiazol-5-ylmethyl) (2S,2'S,3S,3'S,5S,5'S)-5,5'-carbonylbis(azanediyl)bis(3-hydroxy-1,6-diphenylhexane-5,2-diyl)dicarbamate.

^x Thiazol-5-ylmethyl (2S,3R,5R)-3-hydroxy-5-[(S)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.

^y Thiazol-5-ylmethyl (2S,3S,5R)-3-hydroxy-5-[(S)-2-{3-[(2-isopropylthiazol-4-yl)methyl]-3-methylureido}-3-methylbutanamido]-1,6-diphenylhexan-2-ylcarbamate.

^z (S)-N-[(2S,4S,5S)-5-(Thiazol-5-ylmethoxycarbonylamino)-4-hydroxy-1,6-diphenylhexan-2-yl]-2-{3-[(2S,4S,5S)-5-(thiazol-5-ylmethoxycarbonylamino)-4-hydroxy-1,6-diphenylhexan-2-yl]ureido}-3-methylbutanamide.

^{aa} Disregard any peak less than 0.01% in the calculation of total impurities.

To identify the lopinavir impurities, determine the relative retention value from the 215-nm chromatogram relative to ritonavir (see Table 2). Compare the 215-nm chromatogram to the 240-nm chromatogram.

Any impurity assigned as a ritonavir impurity at 240 nm that is also observed at 215 nm is discounted. Unspecified ritonavir impurities are assigned according to the algorithm outlined in Table 3.

Calculate the percentage of each unspecified lopinavir impurity at 215 nm in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the *Sample solution*

r_S = peak response of lopinavir from the *Standard solution*

C_S = concentration of USP Lopinavir RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lopinavir in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2.

For calculating and reporting impurities, follow the algorithm outlined in Table 3.

Table 3

Wavelength (nm)	Unspecified Impurity Observed	
240	Yes	No
215	Yes or No	Yes
Peak assigned to	Ritonavir	Lopinavir
Quantitation wavelength	240 nm	215 nm

SPECIFIC TESTS

• ALCOHOL DETERMINATION (611)

Internal standard solution: Transfer 10.0 mL of butyl alcohol to a 200-mL volumetric flask and dilute with methanol to volume.

Internal standard identification solution: Dilute 5.0 mL of *Internal standard solution* with methanol to 100 mL.

Standard stock solution: 4.0% (v/v) of dehydrated alcohol in methanol

Standard solution: 0.4% (v/v) of dehydrated alcohol prepared as follows. Transfer 10.0 mL of *Standard stock*

solution and 5.0 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with methanol to volume.

Sample stock solution: Transfer 5.0 mL of Oral Solution to a 50-mL volumetric flask with the aid of several portions of methanol, and dilute with methanol to volume.

Sample solution: Transfer 10.0 mL of *Sample stock solution* and 5.0 mL of the *Internal standard solution* to a 100-mL volumetric flask, and dilute with methanol to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m fused silica capillary; coated with a 1-μm film of liquid phase G16

Temperatures

Injection port: 185°

Detector: 220°

Column: See *Table 4*.

Table 4

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	0	40	5
40	10	145	6
145	20	200	9.75

Carrier gas: Helium

Flow rate: 4.5 mL/min

Makeup gas flow: 30 mL/min

Injection volume: 1 μL

Injection type: Split ratio 4:1

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.2 for the alcohol peak

Relative standard deviation: NMT 3.0% for the peak area ratio of alcohol to the internal standard

Analysis

Samples: *Internal standard identification solution*, *Standard solution*, and *Sample solution*

Calculate the percentage of the labeled amount of alcohol in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times D \times 100$$

R_U = peak response ratio of alcohol to butyl alcohol from the *Sample solution*

R_S = peak response ratio of alcohol to butyl alcohol from the *Standard solution*

C_S = concentration of dehydrated alcohol in the *Standard solution* (% v/v)

C_U = nominal concentration of alcohol in the Oral Solution (% v/v)

D = dilution factor used to prepare the *Sample solution*

Acceptance criteria: 85.0%–115.0% of the labeled amount of alcohol (C_2H_6O)

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed 10^2 cfu/mL.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at 2°–8°.

• USP REFERENCE STANDARDS (11)

USP Lopinavir RS

USP Ritonavir RS

Lopinavir and Ritonavir Tablets

DEFINITION

Lopinavir and Ritonavir Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of lopinavir ($C_{37}H_{48}N_4O_5$) and ritonavir ($C_{37}H_{48}N_6O_5S_2$).

IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

ASSAY

• LOPINAVIR AND RITONAVIR

Buffer 1: 4.1 g/L of monobasic potassium phosphate in water

Solution A: Acetonitrile and Buffer 1 (50:50)

Buffer 2: 2.1 g/L of monobasic potassium phosphate in water

Solution B: Acetonitrile and 1-butanol (13:3)

Solution C: Acetonitrile, 1-butanol, Buffer 1, and water (65:15:10:10)

Standard solution: 6.25 μg/mL of USP Ritonavir RS and 25 μg/mL of USP Lopinavir RS in *Solution A*

Sample solution: Place a number of Tablets equivalent to 1000 mg of lopinavir and 250 mg of ritonavir in a 250-mL volumetric flask, add 25 mL of Buffer 2, and agitate to dissolve the Tablet coating, if necessary. Add 100 mL of *Solution B*, and shake mechanically until the Tablets are dissolved. Dilute with *Solution C* to volume. Centrifuge a portion of this solution, and then further dilute with *Solution A* to a nominal concentration of 6.25 μg/mL of ritonavir and 25 μg/mL of lopinavir.

Mobile phase: Acetonitrile, methanol, tetrahydrofuran, and Buffer 1 (175:100:100:625)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

[NOTE—The elution order is ritonavir, then lopinavir.]

Suitability requirements

Capacity factor: 15–24 for the ritonavir peak

Tailing factor: 0.8–1.2 for the ritonavir peak

Theoretical plates: More than 5000 for the ritonavir peak

Relative standard deviation: NMT 2.0% for the ritonavir and lopinavir peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lopinavir ($C_{37}H_{48}N_4O_5$) and ritonavir ($C_{37}H_{48}N_6O_5S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lopinavir or ritonavir from the *Sample solution*

r_S = peak response of lopinavir or ritonavir from the *Standard solution*

C_S = concentration of lopinavir or ritonavir in the *Standard solution* (μg/mL)

C_U = nominal concentration of lopinavir or ritonavir in the *Sample solution* ($\mu\text{g/mL}$)

Acceptance criteria: 90.0%–110.0% of the labeled amounts of lopinavir ($\text{C}_{37}\text{H}_{48}\text{N}_4\text{O}_5$) and ritonavir ($\text{C}_{37}\text{H}_{48}\text{N}_6\text{O}_5\text{S}_2$)

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 60 mM polyoxyethylene 10 lauryl ether (37.56 g/L) in water; 900 mL

Apparatus 2: 75 rpm

Time: 90 min

Mobile phase: Acetonitrile and 4.1 g/L potassium phosphate monobasic (55:45). Adjust with phosphoric acid to an apparent pH of 4.0 ± 0.05 .

Standard solution: Dissolve USP Lopinavir RS in methanol to obtain a solution containing 2.6 mg/mL. Dissolve USP Ritonavir RS in methanol to obtain a solution containing 1.3 mg/mL. Combine portions of these solutions to make a solution containing approximately 0.104 mg/mL of lopinavir and 0.026 mg/mL of ritonavir in *Medium*.

Sample solutions: Pass a portion of the solution under test through a suitable filter. If necessary, dilute the solution with *Medium* to obtain a final sample solution containing approximately 0.104 mg/mL of lopinavir and 0.026 mg/mL of ritonavir.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 215 nm

Column: 4.6-mm \times 15-cm; 5- μm packing L1

Flow rate: 1.5 mL/min

Injection volume: 25 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between lopinavir and ritonavir peaks

Relative standard deviation: NMT 2.0% for the lopinavir and ritonavir peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lopinavir ($\text{C}_{37}\text{H}_{48}\text{N}_4\text{O}_5$) and ritonavir ($\text{C}_{37}\text{H}_{48}\text{N}_6\text{O}_5\text{S}_2$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times 100$$

r_U = peak response of lopinavir or ritonavir from the *Sample solution*

r_S = peak response of lopinavir or ritonavir from the *Standard solution*

C_S = concentration of USP Lopinavir RS or USP Ritonavir RS in the *Standard solution* (mg/mL)

L = Tablet label claim for lopinavir or ritonavir (mg)

D = dilution factor of the *Sample solution*

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amounts of lopinavir ($\text{C}_{37}\text{H}_{48}\text{N}_4\text{O}_5$) and ritonavir ($\text{C}_{37}\text{H}_{48}\text{N}_6\text{O}_5\text{S}_2$) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer 1: 4.1 g/L of monobasic potassium phosphate in water

Solution A: *Buffer 1* and acetonitrile (50:50)

Buffer 2: 2.1 g/L of monobasic potassium phosphate in water

Solution B: Acetonitrile, 1-butanol, and *Buffer 1* (15:5:80)

Solution C: Acetonitrile, 1-butanol, *Buffer 1*, and water (65:15:10:10)

Solution D: Acetonitrile and 1-butanol (13:3)

Buffer solution: 3.8 g/L of monobasic potassium phosphate and 0.25 g/L of dibasic potassium phosphate in water

Mobile phase: Acetonitrile, tetrahydrofuran, 1-butanol, and *Buffer solution* (18:8:5:69). Adjust with 1 M phosphoric acid or 1 M potassium hydroxide, if necessary, to a pH of 6.3 ± 0.1 .

Standard stock solution: 0.025 mg/mL of USP Ritonavir RS in *Solution A*

Standard solution: 2.5 $\mu\text{g/mL}$ of USP Ritonavir RS in *Solution B* from *Standard stock solution*

Ritonavir degradant identification solution: Transfer two 5.0 mL portions of a 1 mg/mL solution of USP Ritonavir RS in *Solution A* to separate 50-mL volumetric flasks. Add 1 g of citric acid to one flask, and shake until dissolved. Heat both flasks at 80° for approximately 24 h. Cool the flasks, and add 13 mL of 1 N sodium hydroxide to the flask containing the citric acid. Dilute both flasks with *Solution B* to volume. Combine equal volumes of both solutions. This solution contains ritonavir and the ritonavir degradation products (*N*-deacylvaline ritonavir, hydantoin aminoalcohol, *O*-acyl isomer, and oxazolidinone derivative).

Ritonavir related compounds identification solution: 1 mg/mL of USP Ritonavir Related Compounds Mixture RS dissolved in *Solution C* and further diluted with *Solution B* to 0.5 mg/mL.

Sample solution: Place a number of Tablets equivalent to 1000 mg of lopinavir and 250 mg of ritonavir into a 250-mL volumetric flask. Add 25 mL of *Buffer 2*, and agitate to dissolve the Tablet coating, if necessary. Add 100 mL of *Solution D*, and shake mechanically until the Tablets are dissolved. Dilute with *Solution C* to volume. Centrifuge a portion of this solution, and further dilute with *Solution B* to a concentration of 2 mg/mL of lopinavir and 0.5 mg/mL of ritonavir.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Column: 4.6-mm \times 15-cm; 3- μm packing L26

Column temperature: 60°

Detector: UV 240 nm

Injection volume: 50 μL

Flow rate: 1.0 mL/min

System suitability

Samples: *Ritonavir degradant identification solution*, *Ritonavir related compounds identification solution*, and *Standard solution*

Suitability requirements

Resolution: NLT 1.0 between the peaks for *O*-acyl isomer and oxazolidinone derivative, *Ritonavir degradant identification solution*. NLT 0.7 between the peaks for hydroxyritonavir and hydantoin aminoalcohol, *Ritonavir related compounds identification solution*

Capacity factor: NLT 10.8, *Standard solution*

Tailing factor: 0.8–1.2, *Standard solution*

Column efficiency: NLT 5000, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each ritonavir degradation product in the *Sample solution*:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of individual degradation product from the *Sample solution*

r_S = peak response of ritonavir from the *Standard solution*

C_S = concentration of USP Ritonavir RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of ritonavir in the Sample solution (mg/mL)

F = relative response factor

Acceptance criteria: See Table 1. [NOTE—Disregard all peaks eluting before the retention time of the *N*-deacylvaline ritonavir peak from the Ritonavir degradant identification solution.]

Table 1

ADDITIONAL REQUIREMENTS

• USP REFERENCE STANDARDS (11)

USP Lopinavir RS

USP Ritonavir RS

USP Ritonavir Related Compounds Mixture RS

Loracarbef

C₁₆H₁₆ClN₃O₄ · H₂O 367.78

1-Azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, 7-[(aminophenylacetyl)amino]-3-chloro-8-oxo-, monohydrate, [6R-[6α,7β(R*)]]- (6R,7S)-7-[(R)-2-Amino-2-phenylacetamido]-3-chloro-8-oxo-1-azabicyclo[4.2.0]oct-2-ene-2-carboxylic acid, monohydrate [121961-22-6].

Anhydrous 349.78

» Loracarbef contains not less than 960 µg and not more than 1020 µg of anhydrous loracarbef (C₁₆H₁₆ClN₃O₄) per mg, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Cefaclor RS

USP Loracarbef RS

USP Loracarbef L-Isomer RS

Identification—

A: Infrared Absorption (197K).

B: The retention time of the loracarbef peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific rotation (781S): between +27° and +33°, calculated on the anhydrous basis, determined in a solution in 0.1 N hydrochloric acid containing 10 mg in each mL.

Crystallinity (69S): meets the requirements.

pH (791): between 3.0 and 5.5, in a suspension (1 in 10).

Water Determination, Method I (921): between 3.5% and 6.0%.

Related compounds—

Solution A—Dissolve 6.9 g of monobasic ammonium phosphate in 1960 mL of water. Adjust with phosphoric acid to a pH of 2.5, add 40 mL of acetonitrile, and mix. Filter, if necessary, to obtain a clear solution, and degas.

Solution B—Dissolve 6.9 g of monobasic ammonium phosphate in 600 mL of water. Adjust with phosphoric acid to a pH of 2.5, add 1400 mL of acetonitrile, and mix. Filter, if necessary, to obtain a clear solution, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*.

NOTE—When preparing the *System suitability solution*, the *Standard solution*, and the *Test solution*, if necessary, sonicate and mix on a vortex mixer to aid in dissolution. Use the solutions immediately after preparation or refrigerate and use within 24 hours.

Phenylglycine solution—Dissolve an accurately weighed quantity of phenylglycine in *Solution A* to obtain a solution having a known concentration of about 0.0075 mg per mL.

System suitability solution—Dissolve accurately weighed quantities of USP Loracarbef RS and USP Cefaclor RS in *Solution A* to obtain a solution having known concentrations of about 0.01 mg of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Loracarbef RS in *Solution A* to obtain a solution having a known concentration of about 0.01 mg per mL.

Test solution—Transfer about 50 mg of Loracarbef, accurately weighed, to a 10-mL volumetric flask, add about 8 mL of *Solution A*, and dissolve. Dilute with *Solution A* to volume, and mix. Filter, if necessary, to obtain a clear solution.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 2 mL per minute, and is maintained at a constant temperature of about 40°. The chromatograph is programmed as follows. Initially it is equilibrated with *Solution A*, then the proportion of *Solution B* is increased linearly from 0% to 14.5% over 9.5 minutes, then increased from 14.5% to 100% over 7.5 minutes, and held

at 100% for an additional 1.5 minutes. Finally, the composition of the *Mobile phase* is changed to 100% *Solution A*, and is allowed to re-equilibrate for about 4 minutes or until a stable baseline is obtained. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for cefaclor and 1.0 for loracarbef; the resolution, R , between the cefaclor peak and the loracarbef peak is between 4.0 and 8.0; and the tailing factor for the loracarbef peak is not more than 1.3. Calculate the recovery of loracarbef from the *System suitability solution* by the formula:

$$100(C/L)(r_L/r_S)$$

in which C is the concentration, in mg per mL, of USP Loracarbef RS in the *Standard solution*; L is the concentration, in mg per mL, of USP Loracarbef RS in the *System suitability solution*; and r_L and r_S are the loracarbef responses in the chromatograms obtained from the *System suitability solution* and the *Standard solution*, respectively: the recovery is between 95% and 105%.

Procedure—Separately inject equal volumes (about 20 μ L) of *Solution A*, the *Phenylglycine solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Disregard any peak responses in the chromatograms that correspond to those in the chromatogram obtained from *Solution A*, and identify any peak in the chromatogram of the *Test solution* that corresponds to the peak for phenylglycine in the chromatogram obtained from the *Phenylglycine solution*. Separately calculate the percentage of each related compound in the portion of Loracarbef taken by the formula:

$$100(C/Y)(r_Y/r_S)$$

in which Y is the concentration, in mg per mL, of Loracarbef in the *Test solution*; r_Y is the response of any related compound in the chromatogram obtained from the *Test solution*; and C and r_S are as defined above: not more than 0.15% of phenylglycine is found, not more than 0.5% of any other related compound is found, and the sum of all other related compounds is not more than 2.0%.

Assay—

Mobile phase—Dissolve 2.0 g of sodium 1-pentanesulfonate in 1560 mL of water, add 20 mL of triethylamine, and adjust with phosphoric acid to a pH of 2.5. Add 440 mL of methanol, mix, and pass through a filter having a porosity of 0.5 μ m or finer, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 10 mg of USP Loracarbef RS, accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase*, using sonication, if necessary, to achieve dissolution, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer about 10 mg of Loracarbef, accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase*, using sonication, if necessary, to achieve dissolution, dilute with *Mobile phase* to volume, and mix.

Resolution solution—Prepare a solution in *Mobile phase* containing about 0.2 mg each of USP Loracarbef RS and of USP Loracarbef L-Isomer RS in each mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.6 for loracarbef L-isomer and 1.0 for loracarbef; and the resolution, R , between the loracarbef L-isomer peak and the loracarbef peak is not less than 6.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the capacity factor for the loracarbef peak is not less than 5 and not more than 8; the tailing factor is

not less than 0.8 and not more than 1.3; the column efficiency, determined from the loracarbef peak, is not less than 2500 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in μ g, of anhydrous loracarbef ($C_{16}H_{16}ClN_3O_4$) in each mg of the Loracarbef taken by the formula:

$$(WP/w)(r_U/r_S)$$

in which W is the quantity, in mg, of USP Loracarbef RS taken to prepare the *Standard preparation*; P is the assigned potency, in μ g of anhydrous loracarbef ($C_{16}H_{16}ClN_3O_4$) in each mg of USP Loracarbef RS; w is the quantity, in mg, of Loracarbef taken to prepare the *Assay preparation*; and r_U and r_S are the loracarbef peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Loracarbef Capsules

» Loracarbef Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous loracarbef ($C_{16}H_{16}ClN_3O_4$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Cefaclor RS

USP Loracarbef RS

USP Loracarbef L-Isomer RS

Identification—The retention time of the loracarbef peak in the chromatogram of the *Assay preparation*, corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of anhydrous loracarbef ($C_{16}H_{16}ClN_3O_4$) dissolved from UV absorbances at the wavelength of maximum absorption at about 260 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Loracarbef RS in the same medium.

Tolerances—Not less than 75% (Q) of the labeled amount of anhydrous loracarbef ($C_{16}H_{16}ClN_3O_4$) is dissolved in 30 minutes.

Uniformity of dosage units (905)—meet the requirements.

Water Determination, Method I (921): not more than 8.5%.

Related compounds—

Solution A, *Solution B*, *Mobile phase*, *System suitability solution*, *Standard solution*, and *Chromatographic system*—Proceed as directed in the test for *Related compounds* under *Loracarbef*.

Test solution—Remove, as completely as possible, the contents of not less than 5 Capsules. Weigh the contents, and determine the average weight of the content of each Capsule. Transfer an accurately weighed portion of the powder, equivalent to 125 mg of loracarbef, based on the la-

beled amount per Capsule, to a 25-mL volumetric flask. Add about 20 mL of *Solution A* to the flask, mix, sonicate, and mix on a vortex mixer to aid in dissolution. Dilute with *Solution A* to volume, and mix. Filter, and use the filtrate as the *Test solution* immediately, or refrigerate and use within 24 hours.

Procedure—Proceed as directed for *Procedure* in the test for *Related compounds* under *Loracarbef*, except to omit the injection of *Phenylglycine solution*. Calculate the percentage of each related compound in the portion of Capsule contents taken by the formula:

$$100(C/Y)(r_1 / r_3)$$

in which *C* is the concentration, in mg per mL, of USP Loracarbef RS in the *Standard solution*; *Y* is the concentration, in mg per mL, of loracarbef in the *Test solution*; *r*₁ is the response of any related compound obtained from the *Test solution*; and *r*₃ is the loracarbef response obtained from the *Standard solution*: not more than 1.0% of any individual related compound is found, and the sum of all related compounds is not more than 3.0%.

Assay—

Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the Assay under *Loracarbef*.

Assay preparation—Remove, as completely as possible, the contents of not less than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of loracarbef, to a 50-mL volumetric flask. Add about 40 mL of *Mobile phase*, and dissolve with the aid of swirling and sonication. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5 μm or finer, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Loracarbef*. Calculate the quantity, in mg, of loracarbef (C₁₆H₁₆ClN₃O₄) in the portion of Capsules taken by the formula:

$$(CP/20)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Loracarbef RS in the *Standard preparation*; *P* is the specified potency, in μg of anhydrous loracarbef (C₁₆H₁₆ClN₃O₄) per mg, of USP Loracarbef RS; and *r*_U and *r*_S are the loracarbef peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Loracarbef for Oral Suspension

» Loracarbef for Oral Suspension is a dry mixture of Loracarbef and one or more suitable suspending agents, preservatives, coloring agents, antifoaming agents, flavorings, and sweeteners. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of anhydrous loracarbef (C₁₆H₁₆ClN₃O₄).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Cefaclor RS

USP Loracarbef RS

USP Loracarbef L-Isomer RS

Identification—The retention time of the loracarbef peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the Assay.

Uniformity of dosage units (905)—

FOR SOLIDS PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 3.0 and 5.5, in the Loracarbef for Oral Suspension constituted as directed in the labeling.

Water Determination, Method I (921): not more than 2.0%.

Related compounds—

Solution A, Solution B, Mobile phase, System suitability solution, Standard solution, and Chromatographic system—Proceed as directed in the test for *Related compounds* under *Loracarbef*.

Test solution—Constitute a container of Loracarbef for Oral Suspension as directed in the labeling. Transfer an accurately measured portion of the Suspension thus obtained, equivalent to 100 mg of loracarbef, based on the labeled amount per mL of the Suspension, to a 25-mL volumetric flask. Add about 20 mL of *Solution A* to the flask, mix, sonicate, and mix on a vortex mixer to effect dissolution. Dilute with *Solution A* to volume, and mix. Filter, and use the filtrate as the *Test solution* immediately, or refrigerate and use within 24 hours.

Procedure—Proceed as directed for *Procedure* in the test for *Related compounds* under *Loracarbef*, except to omit the injection of the *Phenylglycine solution*. Calculate the percentage of each related compound in the Suspension taken by the formula:

$$100(C/Y)(r_1 / r_3)$$

in which *C* is the concentration, in mg per mL, of USP Loracarbef RS in the *Standard solution*; *Y* is the concentration, in mg per mL, of loracarbef in the *Test solution*; *r*₁ is the response of any related compound obtained from the *Test solution*; and *r*₃ is the loracarbef response obtained from the *Standard solution*: not more than 1.0% of any individual related compound is found, and the sum of all related compounds is not more than 4.0%.

Assay—

Mobile phase, Standard preparation, Resolution solution, and Chromatographic system—Proceed as directed in the Assay under *Loracarbef*.

Assay preparation—Constitute 1 container of Loracarbef for Oral Suspension as directed in the labeling. Transfer an accurately measured volume of Loracarbef for Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 200 mg of Loracarbef, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a porosity of 0.5 μm or finer, and use the filtrate as the *Assay preparation*.

Procedure—Proceed as directed for *Procedure* in the Assay under *Loracarbef*. Calculate the quantity, in mg, of anhydrous loracarbef (C₁₆H₁₆ClN₃O₄) in each mL of Loracarbef for Oral Suspension taken by the formula:

$$(CP / V)(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Loracarbef RS in the *Standard preparation*; *P* is the specified potency, in μg of anhydrous loracarbef (C₁₆H₁₆ClN₃O₄) per mg, of USP Loracarbef RS; *V* is the volume, in mL, of Loracarbef for Oral Suspension taken to prepare the *Assay preparation*; and *r*_U and *r*_S are the loracarbef peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Loratadine

$C_{22}H_{23}ClN_2O_2$ 382.88

1-Piperidinecarboxylic acid, 4-(8-chloro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene)-, ethyl ester;

Ethyl 4-(8-chloro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene)-1-piperidinecarboxylate [79794-75-5].

DEFINITION

Loratadine contains NLT 98.5% and NMT 101.0% of loratadine ($C_{22}H_{23}ClN_2O_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Buffer A (0.01 M dibasic potassium phosphate):

1.74 g/L of anhydrous dibasic potassium phosphate in water

Buffer B (0.6 M dibasic potassium phosphate): 105 g/L of anhydrous dibasic potassium phosphate in water

0.05 N hydrochloric acid: Transfer 500 mL of water to a 1000-mL volumetric flask, add 83 mL of hydrochloric acid, and dilute with water to volume. Transfer 50 mL of this solution into a 1000-mL volumetric flask, and dilute with water to volume.

Mobile phase: Acetonitrile, methanol, and *Buffer A* (60:60:70). Adjust with 10% phosphoric acid to an apparent pH of 7.2.

Diluent: Transfer 400 mL of 0.05 N hydrochloric acid and 80 mL of *Buffer B* to a 1-L volumetric flask. Dilute with a mixture of acetonitrile and methanol (1:1) to volume.

Standard solution: 0.4 mg/mL of USP Loratadine RS in *Diluent*

Sample solution: 0.4 mg/mL of Loratadine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 25°–35°

Flow rate: 1 mL/min

Injection volume: 15 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of loratadine ($C_{22}H_{23}ClN_2O_2$) in the portion of Loratadine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Loratadine RS in the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 98.5%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): 10 ppm • (Official 1-Jan-2018)

ORGANIC IMPURITIES, PROCEDURE 1

[NOTE—On the basis of the synthetic route, perform either *Procedure 1* or *Procedure 2*. *Procedure 2* is recommended if 4,8-dichloro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-one is a potential related compound.]

Mobile phase and Diluent: Proceed as directed in the Assay.

Standard solution: 0.8 μg/mL of USP Loratadine RS in *Diluent*

Sample solution: 0.4 mg/mL of Loratadine in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Column temperature: 25°–35°

Flow rate: 1 mL/min

Injection volume: 50 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 4.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Loratadine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each impurity from the *Sample solution*

r_S = peak area of loratadine from the *Standard solution*

C_S = concentration of USP Loratadine RS in the *Standard solution* (mg/mL)

C_U = concentration of Loratadine in the *Sample solution* (mg/mL)

F = relative response factor as listed in *Table 1*

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Fluoroloratadine ^a	0.79	0.25	0.2
Loratadine	1.0	—	—
Any other individual impurity	—	1.0	0.1
Total impurities	—	—	0.3

^a Ethyl 4-(8-chloro-11-fluoro-5,6-dihydro-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-yl) piperidin-1-carboxylate.

ORGANIC IMPURITIES, PROCEDURE 2

Solution A: Dissolve 0.96 g of 1-pentanesulfonic acid sodium salt in 900 mL of water. Adjust with phosphoric acid solution (1 in 10) to a pH of 3.00 ± 0.05, and dilute with water to 1 L.

Solution B: Acetonitrile

Mobile phase: See *Table 2*.

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	75	25
20	50	50
30	40	60
35	30	70
45	30	70
50	75	25

Standard stock solution: 0.1 mg/mL each of USP Loratadine RS, USP Loratadine Related Compound A RS, and USP Loratadine Related Compound B RS in methanol

Standard solution: 0.01 mg/mL each of USP Loratadine RS, USP Loratadine Related Compound A RS, and USP Loratadine Related Compound B RS prepared as follows. Transfer 1.0 mL of the *Standard stock solution* to a 10-mL volumetric flask, add 2 mL of *Solution A*, and dilute with methanol to volume.

Sample solution: 10 mg/mL of Loratadine prepared as follows. Transfer 100 mg of Loratadine to a 10-mL volumetric flask, and dissolve in 2 mL of methanol. Add 2 mL of *Solution A*, and then dilute with methanol to volume.

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1.2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between loratadine related compound A and loratadine related compound B

Relative standard deviation: NMT 10% for the loratadine peak

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Loratadine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak area of each individual impurity from the *Sample solution*

r_S = peak area of loratadine from the *Standard solution*

C_S = concentration of USP Loratadine RS in the *Standard solution* (mg/mL)

C_U = concentration of Loratadine in the *Sample solution* (mg/mL)

F = relative response factor as listed in Table 3.

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Loratadine related compound A	0.50	1.00	0.1
Loratadine related compound B	0.53	0.89	0.1
Loratadine related compound C ^a	0.70	0.60	0.1
Hydroxy deacyl analog ^b	0.75	0.46	0.1
Loratadine	1.00	—	—

Loratadine Oral Solution

DEFINITION

Loratadine Oral Solution contains NLT 94.0% and NMT 105.0% of the labeled amount of loratadine (C₂₂H₂₃ClN₂O₂).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Standard solution: 5 mg/mL of USP Loratadine RS in dichloromethane

Sample solution: Place a volume of Oral Solution, equivalent to 10 mg of loratadine, in a centrifuge tube. Add 10 mL of 0.2 N sodium hydroxide and 2.0 mL of dichloromethane. Rotate the centrifuge tube for 10 min, centrifuge, and discard the aqueous phase.

Developing solvent system: Ethyl ether and diethylamine (40:1), in a paper-lined tank

Acceptance criteria: Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: 6.8 g/L of monobasic potassium phosphate in water, adjusted with phosphoric acid to a pH of 3.0 ± 0.1

Mobile phase: Acetonitrile and *Buffer* (3:7)

Diluent: Acetonitrile and water (3:7)

Internal standard solution: 0.3 mg/mL of butylparaben in *Diluent*

Standard stock solution: 1.0 mg/mL of USP Loratadine RS in acetonitrile

Standard solution: Transfer 5.0 mL of *Internal standard solution*, 5.0 mL of *Standard stock solution*, and 12 mL of water to a 50-mL volumetric flask. Dilute with *Diluent* to volume.

Sample solution: Transfer a portion of Oral Solution, nominally equivalent to 5 mg of loratadine, to a 50-mL volumetric flask. Pipet 5.0 mL of *Internal standard solution* into the flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm \times 30-cm; 10- μ m packing L11

Column temperature: 20°–30°

Flow rate: 2 mL/min

Injection size: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for butylparaben and loratadine are about 0.78 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.9 between loratadine and butylparaben

Tailing factor: NMT 1.6 for the loratadine and butylparaben peaks

Relative standard deviation: NMT 2%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of loratadine to the internal standard from the *Sample solution*

R_S = peak response ratio of loratadine to the internal standard from the *Standard solution*

C_S = concentration of USP Loratadine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of loratadine in the *Sample solution* (mg/mL)

Acceptance criteria: 94.0%–105.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME** (698): Meets the requirements

IMPURITIES

ORGANIC IMPURITIES

Mobile phase: 4.3 g/L of sodium dodecyl sulfate in a mixture of acetonitrile and water (1:1). Adjust with phosphoric acid to a pH of 2.6 ± 0.1 .

Diluent: *Mobile phase* and water (2:1)

System suitability solution 1: 2 μ g/mL of USP Loratadine RS in *Diluent*

System suitability solution 2: 0.2 μ g/mL of USP Loratadine RS in *Diluent* from *System suitability solution 1*

System suitability solution 3: Transfer an amount of Oral Solution, equivalent to 20 mg of loratadine, into a screw-cap glass container. Add 1 mL of 3% aqueous hydrogen peroxide, and mix. Cap, and heat at 65° for 18–24 h. Allow to cool to room temperature, and then dilute 5 mL with *Diluent* to 25 mL.

Sample solution: 0.2 mg/mL of loratadine from a volume of Oral Solution in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L7

Column temperature: 30°–40°

Flow rate: 2 mL/min

Injection size: 50 μ L

System suitability

Samples: *System suitability solution 1*, *System suitability solution 2*, and *System suitability solution 3*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 3.0 between loratadine and 2-hydroxymethyl loratadine, *System suitability solution 3*

Tailing factor: 0.7–1.1, *System suitability solution 1*

Relative standard deviation: NMT 10%, *System suitability solution 2*

Analysis

Sample: *Sample solution*

Calculate the percentage of each individual related compound in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = individual peak response of each related compound in the *Sample solution*

r_T = sum of all the peak responses in the *Sample solution*, excluding excipient peaks

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
4-Hydroxymethyl loratadine ^a	0.70	0.3
2-Hydroxymethyl loratadine ^b	0.84	0.3
Loratadine	1.0	—
Any other individual impurity	—	0.2
Total impurities	—	0.5

^a Ethyl 4-[8-chloro-5,6-dihydro-4-(hydroxymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate.

^b Ethyl 4-[8-chloro-5,6-dihydro-2-(hydroxymethyl)-11H-benzo[5,6]cyclohepta[1,2-b]pyridin-11-ylidene]-1-piperidinecarboxylate.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count is NMT 10^2 cfu/mL, and the total combined molds and yeasts count is NMT 5×10^1 cfu/mL. It meets the requirements for the absence of *Salmonella* species and *Escherichia coli*.
- **PH** (791): 2.2–3.1

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store between 2° and 25°.
- **USP REFERENCE STANDARDS** (11)
USP Loratadine RS

Loratadine Tablets

DEFINITION

Loratadine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Diluent: Chloroform and methanol (1:1)

Standard solution: 4 mg/mL of USP Loratadine RS in Diluent

Sample solution: Nominally 4 mg/mL of loratadine prepared as follows. Transfer a quantity of Tablets equivalent to 20 mg of loratadine to a centrifuge tube. Add 5.0 mL of Diluent, rotate for 30 min, and centrifuge.

Application volume: 5 μ L

Developing solvent system: Ethyl ether and diethylamine (40:1), in a paper-lined tank

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

• PROCEDURE

Buffer A: 0.01 M dibasic potassium phosphate (1.74 g/L of anhydrous dibasic potassium phosphate in water)

Buffer B: 0.6 M dibasic potassium phosphate (105 g/L of anhydrous dibasic potassium phosphate in water)

0.05 N hydrochloric acid: Transfer 500 mL of water to a 1000-mL volumetric flask, add 83 mL of hydrochloric acid, and dilute with water to volume. Transfer 50 mL of this solution to a 1000-mL volumetric flask, and dilute with water to volume.

Mobile phase: Acetonitrile, methanol, and Buffer A (60:60:70). Adjust with 10% phosphoric acid to a pH of 7.2.

Diluent: Transfer 400 mL of 0.05 N hydrochloric acid and 80 mL of Buffer B to a 1-L volumetric flask. Dilute with a mixture of acetonitrile and methanol (1:1) to volume.

Standard solution: 0.4 mg/mL of USP Loratadine RS in Diluent

Sample solution: Transfer 10 Tablets to a 250-mL volumetric flask, add 100 mL of 0.05 N hydrochloric acid, and shake for 40 min or until the Tablets are completely disintegrated. Add 75 mL of a mixture of acetonitrile and methanol (1:1) and 20 mL of Buffer B, and mix for 5 min. Dilute with a mixture of acetonitrile and methanol (1:1) to volume.

Chromatographic system
(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L7

Column temperature: 25°–35°

Flow rate: 1 mL/min

Injection volume: 15 μ L

System suitability

Sample: Standard solution

Suitability requirements

Capacity factor: NLT 3.5

Tailing factor: NMT 1.7

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the Sample solution

r_s = peak response from the Standard solution

C_s = concentration of USP Loratadine RS in the Standard solution (mg/mL)

C_u = nominal concentration of loratadine in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 60 min

Standard solution: USP Loratadine RS at a known concentration in Medium

Sample solution: A filtered portion of the solution under test, suitably diluted with Medium, if necessary

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum absorbance at about 280 nm

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$) dissolved:

$$\text{Result} = (A_u/A_s) \times C_s \times D \times V \times (1/L) \times 100$$

A_u = absorbance of the Sample solution

A_s = absorbance of the Standard solution

C_s = concentration of USP Loratadine RS in the Standard solution (mg/mL)

D = dilution factor for the Sample solution, if needed

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 80% (Q) of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

- **PACKAGING AND STORAGE:** Preserve in tight containers, and store between 2° and 30°. Protect from excessive moisture if packaged in blisters.
- **USP REFERENCE STANDARDS (11)**
USP Loratadine RS

Loratadine Chewable Tablets

DEFINITION

Loratadine Chewable Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of loratadine ($C_{22}H_{23}ClN_2O_2$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

Diluent: Chloroform and methanol (1:1)

Standard solution: 5 mg/mL of USP Loratadine RS in Diluent

Sample solution: Transfer a quantity of ground Chewable Tablets, equivalent to 25 mg of loratadine, to a centrifuge tube. Add 5 mL of Diluent, mix for 30 min, then centrifuge for 5 min. Use the clear supernatant.

Application volume: 5 μ L

Developing solvent system: Ethyl ether and diethylamine (40:1)

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

- **PROCEDURE**

Protect solutions containing loratadine from light.

Buffer A (phosphate buffer pH 7.2): Dissolve 4.35 g of dibasic potassium phosphate in 950 mL of water. Add 1 mL of triethylamine, adjust with 10% phosphoric acid or 10% potassium hydroxide to a pH of 7.2, and dilute with water to 1 L.

Buffer B (0.6 M dibasic potassium phosphate): 105 g/L of dibasic potassium phosphate in water

Diluent: Transfer 400 mL of 0.05 N hydrochloric acid and 80 mL of Buffer B to a 1-L volumetric flask. Dilute with a mixture of acetonitrile and methanol (1:1) to volume.

Mobile phase: Acetonitrile, methanol and Buffer A (40:10:50)

Standard solution: 0.4 mg/mL of USP Loratadine RS in Diluent

Sample solution: Nominally 0.4 mg/mL of loratadine in Diluent. Prepare by transferring 20 Chewable Tablets to a suitable volumetric flask. Add Diluent to 40% of the

volume of the flask, and shake for 40 min. Dilute with Diluent to volume, and filter.

Chromatographic system

Suitability requirements

Resolution: NLT 1.2 between lorazepam related compound D and lorazepam and NLT 1.2 between lorazepam and lorazepam related compound C, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of lorazepam ($C_{15}H_{10}Cl_2N_2O_2$) in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response of lorazepam from the *Sample solution*
 r_s = peak response of lorazepam from the *Standard solution*
 C_s = concentration of USP Lorazepam RS in the *Standard solution* (mg/mL)
 C_u = nominal concentration of lorazepam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES**• ORGANIC IMPURITIES**

Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Standard solution 1: Prepare as directed for the *Standard solution* in the *Assay*.

Standard solution 2: 3.2 µg/mL each of USP Lorazepam Related Compound C RS and USP Lorazepam Related Compound D RS in *Mobile phase*

System suitability

Samples: *System suitability solution* and *Standard solution 1*

[NOTE—The relative retention times for lorazepam related compound D, lorazepam, and lorazepam related compound C are 0.7, 1.0, and 2.7, respectively.]

Suitability requirements

Resolution: NLT 1.2 between lorazepam related compound D and lorazepam and NLT 1.2 between lorazepam and lorazepam related compound C, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution 1*

Analysis

Samples: *Sample solution* and *Standard solution 2*. Do not include as an impurity any peak from the *Sample solution* that has a retention time shorter than that of the lorazepam related compound D peak from *Standard solution 2*.

Calculate the percentage of lorazepam related compound C and lorazepam related compound D in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

- r_u = peak response of lorazepam related compound C or lorazepam related compound D from the *Sample solution*
 r_s = peak response of the corresponding related compound from the *Standard solution*
 C_s = concentration of the corresponding related compound in the *Standard solution* (µg/mL)
 C_u = nominal concentration of lorazepam in the *Sample solution* (µg/mL)

Calculate the percentage of any other impurity in the portion of Injection taken:

$$\text{Result} = (r_u/r_r) \times 100$$

- r_u = peak response of the individual impurity from the *Sample solution*
 r_r = peak response of lorazepam from the *Sample solution*

Acceptance criteria

Total impurities: NMT 4.0% of all impurities

• LIMIT OF LORAZEPAM RELATED COMPOUND B

Standard solution: 0.1 mg/mL of USP Lorazepam Related Compound B RS in acetone

Sample solution: Nominally 10 mg/mL of lorazepam prepared as follows. To 5.0 mL of Injection in a separator add 50 mL of 0.1 N sodium hydroxide. Extract with three 10-mL portions of chloroform, and collect the chloroform extracts in a second separator. Wash the chloroform extracts with 10 mL of water, and transfer the chloroform extracts to a centrifuge tube. Evaporate the chloroform extracts with the aid of a current of air to dryness, and dissolve the residue in acetone.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: Thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel

Application volume

Standard solution: 5 µL

Sample solution: 50 µL

Developing solvent system: Chloroform, *n*-heptane, and alcohol (10:10:1)

Spray reagent 1: 2 N sulfuric acid

Spray reagent 2: 1 mg/mL of sodium nitrite

Spray reagent 3: 5 mg/mL of ammonium sulfamate

Spray reagent 4: 1 mg/mL of *N*-(1-naphthyl)ethylene-diamine dihydrochloride

Analysis

Samples: *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Allow the spots to dry, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved NLT 10 cm from the origin. Lightly spray the plate with *Spray reagent 1*, dry at 105° for 15 min, and spray successively with *Spray reagent 2*, *Spray reagent 3*, and *Spray reagent 4*, drying the plate with a current of air after each spraying. Observe the plate under visible light.

Acceptance criteria: The spot of the *Sample solution* is not greater in size or intensity than the principal spot at the corresponding R_f value of the *Standard solution*, corresponding to NMT 0.1% of lorazepam related compound B.

SPECIFIC TESTS

- BACTERIAL ENDOTOXINS TEST (85):** Contains NMT 10^2 USP Endotoxin Units/mg of lorazepam
- OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Lorazepam RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of lorazepam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

ORGANIC IMPURITIES

Mobile phase: Methanol and 0.05 M monobasic ammonium phosphate (64:36)

Diluent: Methanol and 0.05 M monobasic ammonium phosphate (50:50). Adjust with ammonium hydroxide to a pH of 6.5.

Standard stock solution: 1.0 mg/mL USP Lorazepam RS in methanol

Standard solution 1: 0.16 µg/mL of lorazepam from the *Standard stock solution* in *Diluent*

Standard solution 2: 0.16 µg/mL of USP Lorazepam Related Compound B RS, and 3.2 µg/mL each of USP

Lorazepam Related Compound C RS and USP

Lorazepam Related Compound D RS in *Mobile phase*

System suitability solution: 0.04 mg/mL of USP

Lorazepam RS, and 0.032 mg/mL each of USP

Lorazepam Related Compound C RS and USP

Lorazepam Related Compound D RS in *Diluent*

Sample solution: Nominally 0.16 mg/mL of lorazepam prepared as follows. Transfer a suitable volume of Oral Concentrate to a volumetric flask, and dilute with *Mobile phase* to volume.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm × 10- to 15-cm; packing L1

Flow rate: 0.7 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution 1*

Suitability requirements

Resolution: NLT 1.2 between lorazepam related compound D and lorazepam; NLT 1.2 between lorazepam and lorazepam related compound C, *System suitability solution*

Relative standard deviation: NMT 2.0% for lorazepam, *Standard solution 1*

Analysis

Samples: *Standard solution 2* and *Sample solution*

[NOTE—Disregard peaks eluting prior to lorazepam related compound D.]

Calculate the percentage of lorazepam related compound B, lorazepam related compound C, and lorazepam related compound D in the portion of Oral Concentrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of lorazepam related compound B, lorazepam related compound C, or lorazepam related compound D from the *Sample solution*

r_S = peak response of the corresponding related compound from *Standard solution 2*

C_S = concentration of the corresponding related compound in *Standard solution 2* (mg/mL)

C_U = nominal concentration of lorazepam in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lorazepam related compound D	0.8	4.0 ^a
Lorazepam	1.0	—
Lorazepam related compound C	2.3	4.0 ^a
Lorazepam related compound B	2.9	0.1

^a Includes the sum of lorazepam related compound C and lorazepam related compound D.

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

Change to read:• **USP REFERENCE STANDARDS (11)**

USP Lorazepam RS

USP Lorazepam Related Compound B RS

2-Amino-2',5-dichlorobenzophenone.

C₁₃H₉Cl₂NO • (ERR 1-Jun-2016) 266.13

USP Lorazepam Related Compound E RS

6-Chloro-4-(o-chlorophenyl)-2-quinazoline methanol.

C₁₅H₁₀Cl₂N₂O 305.16**Lorazepam Tablets****DEFINITION**

Lorazepam Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of lorazepam (C₁₅H₁₀Cl₂N₂O₂).

IDENTIFICATION• **A. INFRARED ABSORPTION (197M)**

Sample: Stir a portion of finely powdered Tablets, equivalent to 15 mg of lorazepam, with 40 mL of acetone for 5 min. Pass through very retentive filter paper pre-washed with acetone. Evaporate the filtrate to dryness on a steam bath with the aid of a current of air. Dissolve the residue in 1 mL of acetone, and add 20 mL of 2,2,4-trimethylpentane. Heat the solution on a hot plate to a gentle boil, and evaporate to a volume of about 10 mL. Remove the solution from the hot plate, and evaporate to dryness with the aid of a current of air. Dry the residue under vacuum at 60° for 1 h.

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Diluent: Methanol and water (85:15)

Mobile phase: Acetonitrile, glacial acetic acid, and water (40:0.4:60)

Standard solution: 0.1 mg/mL of USP Lorazepam RS in *Diluent*

Sample solution: Nominally 0.1 mg/mL of lorazepam prepared as follows. Transfer 20 Tablets to a 100-mL volumetric flask, add 50 mL of *Diluent*, sonicate for 10 min, and shake by mechanical means for 20 min. Dilute with *Diluent* to volume, mix, and centrifuge a portion of the solution at 2000 rpm for 10 min. Dilute a portion of the clear supernatant with *Diluent*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lorazepam (C₁₅H₁₀Cl₂N₂O₂) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Lorazepam RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of lorazepam in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: Water; 500 mL

Apparatus 1: 100 rpm

Times: 30 and 60 min

Mobile phase and Chromatographic system: Prepare as directed in the *Assay*, except use an *Injection volume* of 50 μL.

Standard solution: USP Lorazepam RS at a known concentration in *Medium*. Initially, use a volume of alcohol not exceeding 10% of the final volume of the *Standard solution* to dissolve the Reference Standard.

Sample solution: *Sample per Dissolution (711)*.

Analysis

Samples: *Standard solution* and *Sample solution*

Tolerances: NLT 60% (Q) of the labeled amount of lorazepam (C₁₅H₁₀Cl₂N₂O₂) is dissolved in 30 min. NLT 80% (Q) of the labeled amount of lorazepam (C₁₅H₁₀Cl₂N₂O₂) is dissolved in 60 min.

• **UNIFORMITY OF DOSAGE UNITS (905)**

Procedure for content uniformity

Diluent, Mobile phase, Standard solution, and Chromatographic system: Proceed as directed in the *Assay*.

Sample solution: Nominally, 0.1 mg/mL of lorazepam prepared as follows. Place 1 Tablet in a volumetric flask of appropriate size, based on the labeled quantity, in mg, of lorazepam in the Tablet. Add a volume of *Diluent* equal to about 50% of the volume of the flask, sonicate for 10 min, and shake by mechanical means for 20 min. Dilute with *Diluent* to volume, mix, and centrifuge a portion of the solution for 10 min at 2000 rpm.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of lorazepam (C₁₅H₁₀Cl₂N₂O₂) in the portion of the Tablet taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Lorazepam RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of lorazepam in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer: 67.7 g/L of sodium acetate trihydrate in water.

Adjust with glacial acetic acid to a pH of 5.0 ± 0.05 .

Mobile phase: Acetonitrile, glacial acetic acid, and water (50:1.2:50)

Diluent: Methanol and Buffer (75:25)

Standard solution: 1.6 µg/mL of USP Lorazepam RS in Diluent

Peak identification solution: 0.16 mg/mL of USP Lorazepam RS, 1.6 µg/mL each of USP Lorazepam Related Compound A RS, USP Lorazepam Related Compound B RS, USP Lorazepam Related Compound C RS, USP Lorazepam Related Compound D RS, and USP Lorazepam Related Compound E RS in Diluent

Sample solution: Nominally 0.16 mg/mL of lorazepam prepared as follows. Transfer a weighed amount of lorazepam, equivalent to 21.3 mg from powdered Tablets, to a 25-mL volumetric flask. Add 20 mL of Diluent, and stir for 15 min. Do not dilute to volume. Centrifuge at 2000 rpm for 15 min. Pass the supernatant through a polyethersulfone membrane of 0.45-µm pore size. Dilute a portion of the filtrate with Diluent.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC. Use an instrument equipped with a sample compartment chiller maintained at 4°.

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Column temperature: 5°

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: At least 50 min

System suitability

Samples: Standard solution and Peak identification solution

[NOTE—See Table 1 for the approximate relative retention times.]

Suitability requirements

Resolution: NLT 1.2 between lorazepam related compound A and lorazepam related compound E, Peak identification solution

Tailing factor: NMT 2.0, Standard solution

Relative standard deviation: NMT 5%, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity from the Sample solution

r_S = peak response for lorazepam from the Standard solution

C_S = concentration of lorazepam in the Standard solution (mg/mL)

C_U = nominal concentration of lorazepam in the Sample solution (mg/mL)

F = relative response factor for any given impurity (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lorazepam	1.0	1.0	—
Lorazepam related compound D ^a	1.4	1.0	0.5
Lorazepam related compound A ^{b,c}	1.7	—	—
Lorazepam related compound E ^d	1.9	1.3	0.5
Lorazepam related compound C ^e	2.1	1.0	3.0
Lorazepam related compound B ^f	5.5	1.0	0.1
Any individual unspecified degradation product	—	1.0	0.2
Total impurities	—	—	4.0

^a 6-Chloro-4-(o-chlorophenyl)-2-quinazolinecarboxylic acid.

^b 7-Chloro-5-(o-chlorophenyl)-1,3-dihydro-3-acetoxy-2H-1,4-benzodiazepin-2-one.

^c Lorazepam related compound A is included only for peak identification purposes. It is not quantified and should not be included in the total impurities calculation.

^d 6-Chloro-4-(o-chlorophenyl)-2-quinazoline methanol.

^e 6-Chloro-4-(o-chlorophenyl)-2-quinazolinecarboxaldehyde.

^f 2-Amino-2',5-dichlorobenzophenone.

ADDITIONAL REQUIREMENTS

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for losartan and triphenylmethanol are 1.0 and 1.9, respectively. The typical retention time for triphenylmethanol is 20 min.]

Suitability requirements

Tailing factor: NMT 1.6

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of losartan potassium ($C_{22}H_{22}ClKN_6O$) taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity
 r_T = sum of the responses for all peaks

Acceptance criteria

Individual impurities: NMT 0.2%

Total impurities: NMT 0.5%

SPECIFIC TESTS

- WATER DETERMINATION, Method I (921):** NMT 0.5%. If labeled as an amorphous form, NMT 5.0%.

ADDITIONAL REQUIREMENTS

- LABELING:** Where it is an amorphous form, the label so indicates.
- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature.
- USP REFERENCE STANDARDS (11)**
 USP Losartan Potassium RS

Losartan Potassium Tablets

DEFINITION

Losartan Potassium Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$).

IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Buffer: 1.25 mg/mL of monobasic potassium phosphate and 1.5 mg/mL of dibasic sodium phosphate in water. The resulting pH is approximately 7.0. Pass the solution through a PTFE or equivalent filter of 0.45- μ m pore size, and degas before use.

Solution A: Acetonitrile and *Buffer* (15:85)

Solution B: Use acetonitrile.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	80	20
10	40	60
11	80	20
15	80	20

System suitability stock solution: Dissolve 12 mg of USP Losartan Potassium RS in a 50-mL volumetric flask, first using 5 mL of water, followed by 5 mL of 0.1 N hydrochloric acid. Place the flask in a 105° oven for 1–2 h, and allow to cool to room temperature. Pipet 5 mL of 0.1 N sodium hydroxide into the flask, and dilute with water to volume. Adjust with either 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 6.0. [NOTE—The resulting solution contains the 1H-dimer and 2H-dimer, and the resulting solution may be cloudy.]

System suitability solution: Add 3 mL of acetonitrile to 7 mL of *System suitability stock solution* to clear the cloudy solution, and mix well.

Standard solution: 0.25 mg/mL of USP Losartan Potassium RS in *Solution A*. Pass through a PTFE or equivalent filter of 0.45- μ m pore size.

Sample stock solution: Transfer 10 Tablets to a 500-mL volumetric flask, add *Solution A* to fill the flask to about 50% of the final volume, and sonicate with intermittent shaking for 15 min. Sonicate for an additional 10 min. Dilute with *Solution A* to volume, and mix well.

Sample solution: 0.25 mg/mL of losartan potassium in *Solution A* from the *Sample stock solution*. Mix well. Pass an aliquot of the solution through a PTFE filter of 0.45- μ m pore size, and use the filtrate.

Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 250 nm

Column: 3.9-mm \times 15-cm; 5- μ m packing L7

Flow rate: 1.0 mL/min

Injection volume: 10 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0 for the losartan, 1H-dimer, and 2H-dimer peaks; *System suitability solution*

Resolution: NLT 2.0 between the 1H-dimer and 2H-dimer, *System suitability solution*

Column efficiency: NLT 3000 theoretical plates, *Standard solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of losartan from the *Sample solution*

r_S = peak response of losartan from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of losartan potassium in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

DISSOLUTION <711>

Test 1

Medium: Water; 900 mL, deaerated

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: (L/1000) mg/mL of USP Losartan Potassium RS in *Medium*, where L is the Tablet label claim, in mg

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Analysis: Determine the amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) dissolved by using one of the following procedures:

Instrumental conditions

Analytical wavelength: Maximum absorbance at about 256 nm

Path length: See *Table 2* or make the appropriate dilution of the solutions with *Medium* to be within the linearity range of the spectrophotometer.

Table 2

Tablet Strength (mg/Tablet)	Cell Size (cm)
25	1.0
50	0.5
100	0.2

Blank: *Medium*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Chromatographic procedure

Solution A: 0.1% v/v phosphoric acid in water

Mobile phase: Acetonitrile and *Solution A* (40:60)

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.0-mm × 25-cm; 5-μm packing L1

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 1.5 times the retention time of losartan

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

L = label claim (mg/Tablet)

Tolerances: NLT 75% (Q) of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 2*.

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min

Buffer: 1.4 g/L of anhydrous monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 3.3 ± 0.1 .

Mobile phase: Methanol, acetonitrile, and *Buffer* (20:20:60)

Standard solution: 0.028 mg/mL of USP Losartan Potassium RS in *Medium*

Sample solution

For Tablets labeled to contain 25 mg: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

For Tablets labeled to contain 50 and 100 mg: Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size. Further dilute the filtrate with *Medium* to prepare a 0.028-mg/mL solution.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 15-cm; 5-μm packing L10

Column temperature: 45°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 85% (Q) of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that the product meets USP *Dissolution Test 3*.

Medium: Water; 900 mL, deaerated

Apparatus 2: 50 rpm

Time: 30 min for 25-mg and 50-mg Tablet strengths, and 45 min for 100-mg Tablet strength

Buffer: 0.025 M phosphoric acid. Adjust with 1 N sodium hydroxide to a pH of 2.15.

Mobile phase: Acetonitrile and *Buffer* (400:600)

Standard stock solution: 0.27 mg/mL of USP Losartan Potassium RS prepared as follows. Add methanol to USP Losartan Potassium RS to fill about 10% of the volume of the flask, and add *Medium* to fill about 50% of the volume of the flask. Sonicate for NLT 15 min. Cool to room temperature, and dilute with *Medium* to volume.

Standard solution: Prepare as directed in *Table 3* from the *Standard stock solution*.

Table 3

Tablet Strength (mg/Tablet)	Concentration (mg/mL)
25	0.027
50	0.054
100	0.108

Sample solution: Pass a portion of the solution under test through a suitable polyethylene filter of 10-μm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 10-cm; 3.5-μm packing L7

Column temperature: 40°

Flow rate: 1.5 mL/min

Injection volume: 10 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

r_U = peak response of losartan from the *Sample solution*

r_S = peak response of losartan from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS in the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) is dissolved for 25-mg and 50-mg Tablet strengths. NLT 80% (Q) of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) is dissolved for 100-mg Tablet strength.

• **UNIFORMITY OF DOSAGE UNITS** (905)

Procedure for content uniformity

Buffer: Dissolve 1.36 mg/mL of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Diluent: Dissolve 17.42 g of dibasic potassium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 8.0. Dilute with water to a volume of 1000 mL, and mix well. Further dilute with water (1 in 10), and mix well.

Mobile phase: Acetonitrile and Buffer (60:40)

Standard solution: 0.05 mg/mL of USP Losartan Potassium RS in Diluent

Sample stock solution: Transfer 1 Tablet to a 100-mL volumetric flask, add about 65 mL of Diluent, and shake mechanically for 30 min. Dilute with Diluent to volume, and mix well.

Sample solution: 0.05 mg/mL of losartan potassium in Diluent from the Sample stock solution. Filter an aliquot of the solution, and use the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm × 25-cm; 10-μm packing L7

Flow rate: 1.4 mL/min

Injection volume: 20 μL

System suitability

Sample: Standard solution

Suitability requirements

Column efficiency: NLT 3000 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClN_6O$) in the portion of the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of losartan from the Sample solution

r_S = peak response of losartan from the Standard solution

C_S = concentration of USP Losartan Potassium RS in the Standard solution (mg/mL)

C_U = nominal concentration of losartan potassium in the Sample solution (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• **ORGANIC IMPURITIES**

Solution A, Solution B, Mobile phase, System suitability solution, Sample solution, and Chromatographic system: Prepare as directed in the Assay.

Standard stock solution: Use the Standard solution, prepared as directed in the Assay.

Standard solution: 2.5 μg/mL of USP Losartan Potassium RS in Solution A from the Standard stock solution

Sensitivity solution: Dilute 1 mL of the Standard solution to 10 mL in Solution A.

System suitability

Samples: System suitability solution, Standard solution, and Sensitivity solution

Suitability requirements

Tailing factor: NMT 2.0 for the losartan, 1H-dimer, and 2H-dimer peaks; System suitability solution

Resolution: NLT 2.0 between the 1H-dimer and 2H-dimer, System suitability solution

Column efficiency: NLT 3000 theoretical plates, Standard solution

Tailing factor: NMT 2.0, Standard solution

Relative standard deviation: NMT 5.0%, Standard solution

Signal-to-noise ratio: NLT 10 for the losartan peak from the first injection. If this is not met, then the Signal-to-noise ratio must be greater than 3 with a relative standard deviation of area counts less than 25% for three replicate injections, Sensitivity solution.

Analysis

Samples: Standard solution and Sample solution

[NOTE—Identify the peaks using the relative retention times provided in Table 4.]

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each individual impurity from the Sample solution

r_S = peak response of losartan from the Standard solution

C_S = concentration of USP Losartan Potassium RS in the Standard solution (mg/mL)

C_U = nominal concentration of losartan potassium in the Sample solution (mg/mL)

Acceptance criteria: See Table 4.

Table 4

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Losartan	1.0	—
1H-Dimer ^a	2.4	0.5
2H-Dimer ^b	2.9	0.5
Total impurities ^c	—	1.0

^a 5-[4'-[(2-Butyl-5-[(5-[4'-[(2-butyl-4-chloro-5-hydroxymethyl-1H-imidazol-1-yl)methyl]biphenyl-2-yl)-1H-tetrazol-1-yl)methyl]-4-chloro-1H-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^b 5-[4'-[(2-Butyl-5-[(5-[4'-[(2-butyl-4-chloro-5-hydroxymethyl-1H-imidazol-1-yl)methyl]biphenyl-2-yl)-2H-tetrazol-2-yl)methyl]-4-chloro-1H-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^c The total impurities include the sum of all the specified impurities and the sum of all the unspecified impurities. Disregard peaks less than 0.1%.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Store in tightly closed containers, protected from light, at controlled room temperature.

• **LABELING:** When more than one Dissolution test is given, the labeling states the test used only if Test 1 is not used.

• **USP REFERENCE STANDARDS** (11)
USP Losartan Potassium RS

Losartan Potassium and Hydrochlorothiazide Tablets

DEFINITION

Losartan Potassium and Hydrochlorothiazide Tablets contain NLT 95.0% and NMT 105.0% of the labeled amounts of losartan potassium ($C_{22}H_{22}ClN_6O$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

• **A.** The retention times of the major peaks of the Sample solution correspond to those of the Standard solution, as obtained in the Assay.

ASSAY

• **PROCEDURE**

Buffer A: 2.76 g/L of monobasic sodium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Buffer B: 1.25 g/L of monobasic potassium phosphate and 1.5 g/L of dibasic sodium phosphate in water. The pH of the resulting solution is about 7.0–7.5.

Diluent: Acetonitrile and *Buffer A* (3:2)

Solution A: Acetonitrile and *Buffer B* (7:93)

Solution B: Use acetonitrile.

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
12	92	8
28	38	62
30	100	0
35	100	0

Standard solution: Transfer USP Losartan Potassium RS and USP Hydrochlorothiazide RS into a suitable volumetric flask, and dissolve in *Diluent* (50% of the volume of the flask). Dilute with *Buffer A* to volume to obtain a solution having concentrations as directed in *Table 2*. Pass a portion of the solution through a PTFE or equivalent filter of 0.45- μ m pore size.

Table 2

Tablet Strength Losartan Potassium/Hydrochlorothiazide (mg)	Concentration of USP Losartan Potassium RS (mg/mL)	Concentration of USP Hydrochlorothiazide RS (mg/mL)
50/12.5	0.4	0.1
100/12.5	0.4	0.05
100/25	0.4	0.1

Sample stock solution: Transfer 10 Tablets into a suitable volumetric flask and add *Diluent* as directed in *Table 3*. Mix well and mechanically shake or stir until the solid is dispersed. Dilute with *Buffer A* to volume, and sonicate.

Table 3

Tablet Strength Losartan Potassium/Hydrochlorothiazide (mg)	Flask Size (mL)	Volume of Diluent (mL)
50/12.5	250	210
100/12.5	500	420
100/25	500	420

Sample solution: Dilute a portion of the *Sample stock solution* first with acetonitrile (20% of the volume of the flask) and then with *Buffer A*, to obtain a solution having nominal concentrations as directed in *Table 4*. Pass a portion of this solution through a PTFE or equivalent filter of 0.45- μ m pore size, and use the filtrate.

Table 4

Tablet Strength Losartan Potassium/Hydrochlorothiazide (mg)	Concentration of USP Losartan Potassium RS (mg/mL)	Concentration of USP Hydrochlorothiazide RS (mg/mL)
50/12.5	0.4	0.1
100/12.5	0.4	0.05
100/25	0.4	0.1

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm \times 15-cm; 5- μ m packing L7

Column temperature: 35°

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: Less than 2.5 for the losartan peak

Relative standard deviation: Less than 2.0% for both hydrochlorothiazide and losartan peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of losartan or hydrochlorothiazide from the *Sample solution*

r_S = peak response of losartan or hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of losartan potassium or hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

Change to read:

• DISSOLUTION (711)

• **Test 1** (RB 1-jun-2016)

Medium: Water; 900 mL, deaerated

Apparatus 1: 100 rpm

Time: 30 min for both losartan and hydrochlorothiazide

Buffer: Dissolve 1.36 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and *Buffer* (2:3)

Losartan potassium stock solution: 0.44 mg/mL of USP Losartan Potassium RS in *Medium*

Hydrochlorothiazide stock solution: 0.14 mg/mL of USP Hydrochlorothiazide RS prepared by dissolving in methanol (10% of the volume of the flask). Dilute with *Medium* to volume.

Standard solution: Transfer the appropriate volumes of *Losartan potassium stock solution* and *Hydrochlorothiazide stock solution* to a 100-mL volumetric flask according to the dilution schemes in *Table 5*. Dilute with *Medium* to volume.

Table 5

Tablet Strength Losartan Potassium/Hydrochlorothiazide (mg)	Aliquot of Losartan Potassium Stock Solution (mL)	Aliquot of Hydrochlorothiazide Stock Solution (mL)
50/12.5	12.5	10.0
100/12.5	25.0	10.0
100/25	25.0	20.0

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)**Mode:** LC**Detector:** UV 230 nm**Column:** 4.6-mm × 25-cm; 10-μm packing L7**Column temperature:** 35°**Flow rate:** 2.3 mL/min**Injection volume:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Resolution:** NLT 2 between the hydrochlorothiazide and losartan peaks**Relative standard deviation:** NMT 2.0% for both the hydrochlorothiazide and losartan peaks**Analysis****Samples:** *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of losartan potassium (C₂₂H₂₂ClKN₆O) or hydrochlorothiazide (C₇H₈ClN₃O₄S₂) dissolved:

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 10- μ m packing L7

Column temperature: 35°

Flow rate: 2.3 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2 between the hydrochlorothiazide and losartan peaks

Relative standard deviation: NMT 2.0% for both the hydrochlorothiazide and losartan peaks

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of losartan potassium ($C_{22}H_{22}ClKN_6O$) or hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of losartan or hydrochlorothiazide from the *Sample solution*

r_S = peak response of losartan or hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Losartan Potassium RS or USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of losartan potassium or hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer A, Buffer B, Diluent, Solution A, Solution B, Mobile phase, Standard solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Chlorothiazide standard solution: 0.1 mg/mL of USP Chlorothiazide RS prepared by dissolving in *Diluent* (50% of the volume of the flask). Dilute with *Buffer A* to volume, and sonicate.

Benzothiadiazine related compound A standard solution: 0.1 mg/mL of USP Benzothiadiazine Related Compound A RS prepared by dissolving in *Diluent* (50% of the volume of the flask). Dilute with *Buffer A* to volume, and sonicate.

Stressed losartan solution: [NOTE—This solution contains the degradates 1-*H*-dimer and 2-*H*-dimer and losartan potassium.] Weigh 12 mg of the USP Losartan Potassium RS in a 50-mL flask. Dissolve in 5 mL of water. Pipet 5.0 mL of 0.1 N hydrochloric acid into this

solution, and place it in an oven at 105° for 1–2 h. Remove from the oven and allow to cool to room temperature. Pipet 5.0 mL of 0.1 N sodium hydroxide into the flask, and dilute with water to volume.

Diluted standard solution: Dilute portions of the *Standard solution* and *Benzothiadiazine related compound A standard solution* first with acetonitrile (30% of the volume of the flask), then with *Buffer A* to obtain a solution having nominal concentrations based on Tablet strength as listed in Table 9.

Table 9

Tablet Strength Losartan Potassium/ Hydrochlorothiazide (mg)	Concentration of USP Losartan Potassium RS (μ g/mL)	Concentration of USP Hydrochlorothiazide RS (μ g/mL)	Concentration of USP Benzothiadiazine Related Compound A RS (μ g/mL)
50/12.5	4	1	1
100/12.5	4	0.5	1
100/25	4	1	1

System suitability solution: Dissolve weighed quantities of USP Losartan Potassium RS and USP Hydrochlorothiazide RS in a suitable volumetric flask in *Diluent* (50% of the volume of the flask). Add the *Stressed losartan solution*, about 25% of the volume of the flask, into the same flask. Transfer appropriate amounts of *Chlorothiazide standard solution* and *Benzothiadiazine related compound A standard solution* into the same flask, and dilute with *Buffer A* to volume to obtain a solution having a known concentration of about 0.4 mg/mL of losartan, 0.1 mg/mL of hydrochlorothiazide, and 0.001 mg/mL each of benzothiadiazine related compound A and chlorothiazide. Adjust with phosphoric acid to a pH of 2.5, and mix well. Pass an aliquot of the solution through a PTFE or equivalent filter of 0.45- μ m pore size, and use the filtrate.

Limit of quantitation solution: Pipet 5.0 mL of the *Diluted standard solution* into a 50-mL volumetric flask. Add 15 mL of acetonitrile, dilute with *Buffer A* to volume, and mix well.

System suitability

Samples: *Standard solution*, *Diluted standard solution*, *System suitability solution*, and *Limit of quantitation solution*

Suitability requirements

Resolution: Greater than 1.5 between chlorothiazide and benzothiadiazine related compound A; greater than 1.5 between the benzothiadiazine related compound A and hydrochlorothiazide peak, *System suitability solution*

Tailing factor: Less than 2.5 for the losartan peak, *Standard solution*

Relative standard deviation: Less than 2.0% for both the hydrochlorothiazide and losartan peaks, *Standard solution*; less than 10.0% for both the hydrochlorothiazide and losartan peaks, *Diluted standard solution*

Signal-to-noise ratio: NLT 10 for each component from the first injection. If this is not met, then the signal-to-noise ratio must be greater than 3 with a relative standard deviation of area counts less than 25% for three replicate injections, *Limit of quantitation solution*

Analysis

Samples: *Sample solution* and *Diluted standard solution* [NOTE—The run time is about 1.6 times the retention time of the losartan peak. Identify the peaks using the relative retention times provided in Table 10.]

Calculate the percentage of benzothiadiazine related compound A (expressed as hydrochlorothiazide equivalent) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response of benzothiadiazine related compound A from the *Sample solution*
 r_S = peak response of benzothiadiazine related compound A from the *Diluted standard solution*
 C_S = concentration of USP Benzothiadiazine Related Compound A RS in the *Diluted standard solution* (mg/mL)
 C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of hydrochlorothiazide, 298
 M_{r2} = molecular weight of benzothiadiazine related compound A, 286

Calculate the percentage of each specified impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each individual impurity from the *Sample solution*
 r_S = peak response of losartan from the *Diluted standard solution*
 C_S = concentration of USP Losartan Potassium RS in the *Diluted standard solution* (mg/mL)
 C_U = nominal concentration of losartan potassium in the *Sample solution* (mg/mL)

For Tablet strengths of 50/12.5 and 100/25 for losartan potassium/hydrochlorothiazide, respectively, calculate the percentage of any other impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each individual impurity from the *Sample solution*
 r_S = peak response of losartan from the *Diluted standard solution*
 C_S = concentration of USP Losartan Potassium RS in the *Diluted standard solution* (mg/mL)
 C_U = nominal concentration of losartan potassium in the *Sample solution* (mg/mL)

For a Tablet strength of 100/12.5 for losartan potassium/hydrochlorothiazide, calculate the percentage of any other impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of each individual impurity from the *Sample solution*
 r_S = peak response of hydrochlorothiazide from the *Diluted standard solution*
 C_S = concentration of USP Hydrochlorothiazide RS in the *Diluted standard solution* (mg/mL)
 C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria See Table 10.

Table 10

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Chlorothiazide ^a	0.57	—
Benzothiadiazine related compound A	0.69	1.0
Hydrochlorothiazide	1.0	—
Losartan	2.7	—
1-H-Dimer ^b	3.3	0.5
2-H-Dimer ^c	3.5	0.5
Total impurities ^d	—	2.0

^a This process impurity (not a degradation product) is related to hydrochlorothiazide and is controlled in the drug substance.

^b Related to losartan potassium: 5-[4'-[(2-butyl-5-[(2-butyl-4-chloro-5-hydroxymethyl-1H-imidazol-1-yl)methyl]biphenyl-2-yl)-1H-tetrazol-1-yl]methyl]-4-chloro-1H-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^c Related to losartan potassium: 5-[4'-[(2-butyl-5-[(2-butyl-4-chloro-5-hydroxymethyl-1H-imidazol-1-yl)methyl]biphenyl-2-yl)-2H-tetrazol-2-yl]methyl]-4-chloro-1H-imidazol-1-yl)methyl]biphenyl-2-yl]tetrazol, potassium salt.

^d Total impurities include the sum of all the specified impurities and the unspecified impurities that are equal to or greater than 0.1%.

ADDITIONAL REQUIREMENTS

Add the following:

- LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
 • (RB 1-Jun-2016)
- PACKAGING AND STORAGE:** Preserve in tightly closed containers protected from light, and store at controlled room temperature.

 Butanoic acid, 2-methyl-, 1,2,3,7,8,8a-hexahydro-3,7-dimethyl-8-[2-(tetrahydro-4-hydroxy-6-oxo-2H-pyran-2-yl)ethyl]-1-naphthalenyl ester, [1S-[1 α (R*),3 α ,7 β ,8 β (2S*,4S*),8 α]]-
 (5)-2-Methylbutyric acid, 8-ester with (4R,6R)-6-[2-[(1S,2S,6R,8S,8aR)-1,2,6,7,8,8a-hexahydro-8-hydroxy-2,6-dimethyl-1-naphthyl]ethyl]tetrahydro-4-hydroxy-2H-pyran-2-one [75330-75-5].

» Lovastatin contains not less than 98.5 percent and not more than 101.0 percent of $C_{24}H_{36}O_5$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers under nitrogen in a cold place.

USP Reference standards (11)—

USP Lovastatin RS

USP Lovastatin Related Compound A RS

[Dihydro-lovastatin][butanoic acid, 2-methyl-, 1,2,3,4,4a,7,8,8a-octahydro-3,7-dimethyl-8-[2(tetrahydro-4-hydroxy-6-oxo-2H-pyran-2-yl)-ethyl]-1-naphthalenyl ester, [1S-[1 α (R*),3 α ,7 β ,8 β (2S*,4S*),-8 α]]]-C₂₄H₃₈O₅ 406.56

Identification—

A: Infrared Absorption (197M).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: acetonitrile.

Specific rotation (781S): between +324° and +338°.

Test solution: 5 mg per mL, in acetonitrile.

Loss on drying (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 0.3% of its weight.**Residue on ignition** (281): not more than 0.2%.**Delete the following:**

*Heavy metals, Method II (231): 0.002%. (Official 1-Jan-2018)

Limit of lovastatin related compound A—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and 0.01 M phosphoric acid (13:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve accurately weighed quantities of USP Lovastatin RS and USP Lovastatin Related Compound A RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution containing 2.0 μ g of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2.0 μ g per mL.

Test solution—Transfer about 25 mg of Lovastatin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 200-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L7. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for lovastatin and 1.3 for lovastatin related compound A; and the resolution, R , between lovastatin and lovastatin related compound A is not less than 6.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of lovastatin related compound A in the portion of Lovastatin taken by the formula:

$$2.5F(C/W)(r_U/r_S)$$

in which F is the response factor for lovastatin related compound A and is equal to 1.6; C is the concentration, in μ g per mL, of USP Lovastatin RS in the *Standard solution*; W is the weight, in mg, of Lovastatin in the *Test solution*; r_U is the peak response for lovastatin related compound A obtained from the *Test solution*; and r_S is the peak response for lovastatin obtained from the *Standard solution*: not more than 0.5% of lovastatin related compound A is found.

Chromatographic purity—

Solution A—Prepare a 0.001 M phosphoric acid solution, adjusted with 1 M sodium hydroxide to a pH of 4.0.

Solution B—Use acetonitrile.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability solution—Dissolve accurately weighed quantities of USP Lovastatin RS and compactin in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution containing 2.0 μ g of each per mL.

Standard solution—Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2.0 μ g per mL.

Test solution—Transfer about 25 mg of Lovastatin, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 238-nm detector and a 4.0-mm \times 12.5-cm column that contains 4- μ m packing L1. The column temperature is maintained at 40°. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–2	60	40	isocratic
2–5	60→45	40→55	linear gradient
5–8	45	55	isocratic
8–16	45→10	55→90	linear gradient
16–25	10	90	isocratic
25–27	10→60	90→40	linear gradient
27–35	60	40	isocratic

Chromatograph the *System suitability solution* and the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.00 for lovastatin and 0.85 for compactin; the resolution, R , between lovastatin and compactin is not less than 3.5; and the relative standard deviation for replicate injections is not more than 5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Lovastatin taken by the formula:

$$2.5(C/W)(r_i/r_S)F$$

in which C is the concentration, in μ g per mL, of USP Lovastatin RS in the *Standard solution*; W is the weight, in mg, of Lovastatin in the *Test solution*; r_i is the peak response for each impurity obtained from the *Test solution*; r_S is the peak response for lovastatin obtained from the *Standard solution*; and F is the response factor for each impurity and is equal to 1.4 for the impurity with a relative retention time of about 0.73 and 1.0 for all other impurities. Disregard any peak with less than 0.04%: not more than 0.2% of any individual impurity is found; and not more than 1.0% of total impurities is found.

Assay—

Dilute phosphoric acid—Transfer 1 mL of phosphoric acid to a 1-L volumetric flask, and dilute with water to volume.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and *Dilute phosphoric acid* (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Lovastatin RS in acetonitrile to obtain a solution having a known concentration of about 0.3 mg per mL.

Assay preparation—Transfer about 30 mg of Lovastatin, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.

Chromatographic system (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 238-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates, the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{24}H_{36}O_5$ in the portion of Lovastatin taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Lovastatin RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Lovastatin Tablets

» Lovastatin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of lovastatin ($C_{24}H_{36}O_5$).

Packaging and storage—Preserve in well-closed, light-resistant containers. Protect from light and store either in a cool place or at controlled room temperature.

USP Reference standards <11>—

USP Lovastatin RS

Identification—

A: Thin-Layer Chromatographic Identification Test <201>—*Test solution*:

FOR TABLETS CONTAINING 10 MG OF LOVASTATIN—Transfer 1 Tablet to a centrifuge tube, add 0.4 mL of water and 1.6 mL of acetonitrile. Mix on a vortex mixer until the tablet disintegrates, and sonicate for 4 minutes. Centrifuge for 4 minutes, and use the clear supernatant.

FOR TABLETS CONTAINING 20 MG OR 40 MG OF LOVASTATIN—Transfer 1 Tablet to a centrifuge tube, add 1 mL of water and 4.0 mL of acetonitrile. Mix on a vortex mixer until the tablet disintegrates, and sonicate for 4 minutes. Centrifuge for 4 minutes, and use the clear supernatant.

Standard solution—Prepare a solution of USP Lovastatin RS in acetonitrile containing 8 mg per mL.

Application volume: 5 μL of the *Test solution*, 3 μL of the *Standard solution* for 10-mg and 20-mg Tablets, 5 μL of the *Standard solution* for 40-mg Tablets.

Developing solvent solution: a mixture of cyclohexane, chloroform, and isopropyl alcohol (5:2:1).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Dissolution <711>—

Medium—Dissolve 1.38 g of monobasic sodium phosphate and 20 g of sodium lauryl sulfate in 900 mL of water. Adjust with 1 N sodium hydroxide to a pH of 7.0, dilute with water to 1000 mL, and mix; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Mobile phase—Proceed as directed in the *Assay*.

Standard solution—Accurately weigh approximately 44 mg of USP Lovastatin RS into a 500-mL volumetric flask, and dissolve in no more than 20 mL of methanol. Dilute with *Medium* to volume, and mix well. Further dilute this solution with *Medium* to obtain a solution containing $L/900$ mg per mL, with L being the Tablet label claim, in mg.

Test solution—Pass the solution under test through a suitable 0.45-μm filter.

Chromatographic system (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 5-cm column that contains 5-μm packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the capacity factor, k' , is greater than 2.0; the tailing factor is less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of lovastatin dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times L}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; and L is the Tablet label claim, in mg.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{24}H_{36}O_5$ is dissolved in 30 minutes.

Uniformity of dosage units <905>: meet the requirements.

Assay—

Buffer solution—Dissolve 3.45 g of monobasic sodium phosphate in 900 mL of water, adjust with phosphoric acid to a pH of 4.0, dilute with water to 1000 mL, and mix.

Dissolving solvent—Add 3.0 mL of glacial acetic acid to 900 mL of water contained in a 1 L beaker, adjust to a pH of 4.0, determined electrometrically, by the addition of a solution of sodium hydroxide (20%), and mix. Transfer the contents of the beaker to a 1000-mL volumetric flask, dilute with water to volume, and mix. Prepare a mixture of acetonitrile and the resultant solution (80:20).

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, *Buffer solution*, and methanol (5:3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

Standard preparation—Dissolve an accurately weighed quantity of USP Lovastatin RS in *Dissolving solvent* to obtain a solution having a known concentration of about 40 μg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of lovastatin, to a 200-mL volumetric flask. Add about 150 mL of *Dissolving solvent*, and sonicate for 20 minutes. Cool to room temperature, and allow the solution to stand for 30 minutes. Dilute with *Dissolving solvent* to volume, and mix. Centrifuge a

portion of this solution, transfer 5.0 mL of the clear supernatant to a 25-mL volumetric flask, dilute with *Dissolving solvent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm × 25-cm column that contains packing L1 and is maintained at 45°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is greater than 3000 theoretical plates, the tailing factor is less than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of the labeled amount of C₂₄H₃₆O₅ in the portion of Tablets taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which C_s is the concentration, in µg per mL, of USP Lovastatin RS in the *Standard preparation*; C_u is the concentration of lovastatin, in µg per mL, in the *Assay preparation*, based on the label claim; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Loxapine Succinate

C₁₈H₁₈ClN₃O · C₄H₆O₄

445.90

Butanedioic acid, compd. with 2-chloro-11-(4-methyl-1-piperazinyl)dibenz[b,f][1,4]oxazepine (1:1); 2-Chloro-11-(4-methyl-1-piperazinyl)dibenz[b,f][1,4]oxazepine succinate (1:1) [27833-64-3].

DEFINITION

Loxapine Succinate contains NLT 98.5% and NMT 101.0% of C₁₈H₁₈ClN₃O · C₄H₆O₄, calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)

Sample solution: 20 µg/mL in 0.01 N hydrochloric acid

ASSAY

• PROCEDURE

Sample: 400 mg of Loxapine Succinate

Analysis: Dissolve in 80 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)).

Calculate the percentage of C₁₈H₁₈ClN₃O · C₄H₆O₄ in the portion of Loxapine Succinate taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / W$$

V = sample titrant volume (mL)

B = blank titrant volume (mL)

N = normality of titrant (mEq/mL)

F = equivalence factor, 22.29 mg/mEq

W = sample weight (mg)

Acceptance criteria: 98.5%–101.0% on the dried basis

• PROCEDURE

Buffer: 3.9 g/L of ammonium acetate in water. Adjust with 20% acetic acid in water or 6 N ammonium hydroxide to a pH of 7.3.

Mobile phase: Acetonitrile and Buffer (3:7)

Diluent: Acetonitrile and Buffer (7:3)

Standard solution: 10 µg/mL of USP Loxapine Succinate RS and 1.5 µg/mL each of USP Amoxapine RS and USP Loxapine Related Compound A RS in Diluent.

[NOTE—Amoxapine has been included in the *Standard solution* for peak identification purposes only.]

Sample solution: 1 mg/mL of Loxapine Succinate in Diluent

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 5-cm; 2.7-µm packing L1

Column temperature: 35°

Flow rate: 1.5 mL/min

Injection size: 10 µL

Run time: 2 times the retention time of loxapine succinate

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between loxapine succinate and loxapine related compound A

Relative standard deviation: NMT 5.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Loxapine Succinate taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times (1 / F) \times 100$$

r_u = peak response of each impurity from the *Sample solution*

r_s = peak response of loxapine succinate from the *Standard solution*

C_s = concentration of USP Loxapine Succinate RS in the *Standard solution* (mg/mL)

C_u = concentration of Loxapine Succinate in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.5%

Loxapine Capsules**DEFINITION**

Loxapine Capsules contain an amount of loxapine succinate (C₁₈H₁₈ClN₃O · C₄H₆O₄) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of loxapine (C₁₈H₁₈ClN₃O).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Mobile phase: Dissolve 4 g of tetramethylammonium chloride in 800 mL of water, and add 200 mL of acetonitrile and 1 mL of phosphoric acid.

Standard solution: 0.136 mg/mL of USP Loxapine Succinate RS prepared as follows. Dissolve a suitable quantity of USP Loxapine Succinate RS in 0.01 N hydrochloric acid in a suitable volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: Nominally 0.1 mg/mL of loxapine prepared as follows. Weigh the contents of NLT 20 Capsules. Transfer a portion of the contents, nominally equivalent to NLT 50 mg of loxapine, to a suitable volumetric flask. Add 10% of the flask volume of 0.1 N hydrochloric acid. Shake, and sonicate for 5 min. Dilute with *Mobile phase* to volume, and filter. Discard the first 8 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Lufenuron

C₁₇H₈Cl₂F₈N₂O₃

511.15

Benzamide, *N*-[[[2,5-dichloro-4-(1,1,2,3,3,3-hexafluoropropoxy)phenyl]amino]carbonyl]-2,6-difluoro-;

1-[2,5-Dichloro-4-(1,1,2,3,3,3-hexafluoropropoxy)phenyl]-3-(2,6-difluorobenzoyl)urea [103055-07-8].

DEFINITION

Lufenuron contains NLT 98.0% and NMT 102.0% of lufenuron (C₁₇H₈Cl₂F₈N₂O₃), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 0.1 mL of phosphoric acid diluted with water to 1 L

Solution B: Acetonitrile

Mobile phase: See *Table 1*. Return to original conditions, and equilibrate the system.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	30	70
5	30	70
15	10	90
17	10	90

Diluent: Acetonitrile and water (70:30)

System suitability solution: 0.4 mg/mL of USP Lufenuron RS and 0.14 mg/mL of USP Lufenuron Related Compound G RS in *Diluent*. Sonicate if necessary to facilitate dissolution.

Standard stock solution: 0.4 mg/mL of USP Lufenuron RS in *Diluent*. Sonicate if necessary to facilitate dissolution.

Standard solution: 0.04 mg/mL of USP Lufenuron RS in *Diluent* from *Standard stock solution*

Sample stock solution: 0.4 mg/mL of Lufenuron in *Diluent*. Sonicate if necessary to facilitate dissolution.

Sample solution: 0.04 mg/mL of Lufenuron in *Diluent* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 255 nm

Column: 4-mm × 25-cm; 5-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lufenuron related compound G and lufenuron are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 3.0 between lufenuron related compound G and lufenuron, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 0.73%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lufenuron ($C_{17}H_8Cl_2F_8N_2O_3$) in the portion of Lufenuron taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Lufenuron RS in the *Standard solution* (mg/mL)
 C_U = concentration of Lufenuron in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

• **ORGANIC IMPURITIES**

Mobile phase, Diluent, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Identification solution: 1.2 μg/mL of USP Lufenuron Related Compound B RS and 1.6 μg/mL of USP Lufenuron Related Compound C RS in *Diluent*

Diluted standard solution: 0.4 μg/mL of USP Lufenuron RS in *Diluent* from *Standard solution*

Sample solution: 0.4 mg/mL of Lufenuron in *Diluent*. Sonicate if necessary to facilitate dissolution.

Analysis

Samples: *Identification solution*, *Diluted standard solution*, and *Sample solution*

Chromatograph the *Identification solution*, and identify the components on the basis of their relative retention times, given in *Table 2*.

Calculate the percentage of each impurity in the portion of Lufenuron taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- r_U = peak response of each impurity from the *Sample solution*
 r_S = peak response of lufenuron from the *Diluted standard solution*
 C_S = concentration of USP Lufenuron RS in the *Diluted standard solution* (μg/mL)
 C_U = concentration of Lufenuron in the *Sample solution* (μg/mL)
 F = relative response factor (see *Table 2*)

Acceptance criteria: See *Table 2*. The reporting level for impurities is 0.1%.

Table 2

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Lufenuron related compound B	0.3	0.77	0.3
Lufenuron related compound C	0.7	0.77	0.4
Lufenuron	1.0	—	—

Lumefantrine

$C_{30}H_{32}Cl_3NO$ 528.94
(±)-2,7-Dichloro-9-[(*Z*)-*p*-chlorobenzylidene]-α[(dibutylamino)methyl]-fluorene-4-methanol [82186-77-4].

DEFINITION

Lumefantrine contains NLT 98.0% and NMT 102.0% of lumefantrine ($C_{30}H_{32}Cl_3NO$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the lumefantrine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: Dissolve 5.65 g of sodium 1-hexanesulfonate and 2.75 g of monobasic sodium phosphate in 900 mL of water. Adjust with phosphoric acid to a pH of 2.3 before dilution with water to a final volume of 1000 mL.

Solution A: Acetonitrile and *Buffer* (300:700)

Solution B: Acetonitrile and 2-propanol (540:460)

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	65	35
1.2	65	35
6.0	50	50
6.4	30	70
10.0	25	75
15.0	10	90
15.1	65	35
20.0	65	35

System suitability stock solution: 10 µg/mL of USP Lumefantrine Related Compound A RS prepared as follows. Transfer a suitable quantity of USP Lumefantrine Related Compound A RS to a volumetric flask, dissolve in 10% volume dichloromethane, and dilute with acetonitrile to volume.

System suitability solution: 1 mg/mL of USP Lumefantrine RS and 1 µg/mL of USP Lumefantrine Related Compound A RS prepared as follows. Transfer 10 mg of USP Lumefantrine RS to a 10-mL volumetric flask, and dissolve in 1 mL of dichloromethane. Add 1.0 mL of the

System suitability stock solution, and dilute with acetonitrile to volume.

Standard solution: 1 mg/mL of USP Lumefantrine RS prepared as follows. Transfer a suitable quantity of USP Lumefantrine RS to a volumetric flask, dissolve in 10% volume of dichloromethane, and dilute with acetonitrile to volume.

Sample solution: 1 mg/mL of Lumefantrine prepared as follows. Transfer a suitable quantity of Lumefantrine to a volumetric flask, dissolve in 10% volume of dichloromethane, and dilute with acetonitrile to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm × 50-mm; 1.8-µm packing L1

Column temperature: Beginning of column, 50°; end of column, 35°

Flow rate: 2.5 mL/min

Injection volume: 2.5 µL

Run time: 20 min

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for lumefantrine related compound A and lumefantrine are 0.9 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 1.3 between lumefantrine and lumefantrine related compound A, *System suitability solution*

Tailing factor: NMT 2.1, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of lumefantrine ($C_{30}H_{32}Cl_3NO$) in the portion of Lumefantrine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)
Acceptance criteria: 98.0%–102.0%

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

Any other individual impurity	—	1.0	0.10
Total impurities	—	—	0.3

^a (Z)-2-(Butylamino)-1-(2,7-dichloro-9-(4-chlorobenzylidene)-9H-fluoren-4-yl)ethanol.

SPECIFIC TESTS

• CLARITY OF SOLUTION

Hydrazine sulfate solution: Transfer 1.0 g of hydrazine sulfate to a 100-mL volumetric flask, and dissolve in and dilute with water to volume. Allow to stand for 4–6 h before use.

Methenamine solution: Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25 mL of water, insert the glass stopper, and mix to dissolve.

Primary opalescent suspension: Transfer 25.0 mL of *Hydrazine sulfate solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Stock opalescence suspension: Transfer 15.0 mL of the *Primary opalescent suspension* to a 1000-mL volumetric flask, and dilute with water to volume. This suspension should not be used beyond 24 h after preparation.

Sample solution: Dissolve 1.0 g of Lumefantrine in dichloromethane, and dilute with dichloromethane to 10.0 mL.

Standard suspension: Transfer 5.0 mL of *Stock opalescence suspension* to a 100-mL volumetric flask, and dilute with water to volume. Prepare only if the *Sample solution* is not as clear as water or dichloromethane.

Analysis

Samples: *Sample solution*, *Standard suspension*, water, and dichloromethane

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension* and dichloromethane to separate matching test tubes. Compare the *Sample solution*, *Standard suspension*, water, and dichloromethane in diffused daylight, viewing vertically against a black background. The diffusion of light must be such that the *Standard suspension* can readily be distinguished from dichloromethane. If the *Sample solution* is as clear as water or dichloromethane, it is not necessary to prepare the *Standard suspension*.

Acceptance criteria: The *Sample solution* shows the same or more clarity than water, dichloromethane, or the *Standard suspension*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.
- **USP REFERENCE STANDARDS (11)**
 USP Lumefantrine RS
 USP Lumefantrine Related Compound A RS

Mafenide Acetate

$C_7H_{10}N_2O_2S \cdot C_2H_4O_2$ 246.28
Benzenesulfonamide, 4-(aminomethyl)-, monoacetate;
 α -Amino-*p*-toluenesulfonamide monoacetate [13009-99-9].

DEFINITION

Mafenide Acetate contains NLT 98.0% and NMT 102.0% of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$), calculated on the anhydrous basis.

IDENTIFICATION

- A. INFRARED ABSORPTION (197K)**
- B.** The R_f value of the principal spot of the *Identification solution* corresponds to that of *Standard solution A*, as obtained in the test for *Organic Impurities*.

ASSAY

PROCEDURE

Standard solution: 200 μ g/mL of USP Mafenide Acetate RS in 0.01 N hydrochloric acid

Sample stock solution: 2 mg/mL of Mafenide Acetate

Sample solution: 200 μ g/mL of Mafenide Acetate prepared as follows. Pipet 10 mL of the *Sample stock solution* into a 100-mL volumetric flask containing 1 mL of 1 N hydrochloric acid, and dilute with water to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 267 nm

Cell: 1 cm

Blank: 0.01 N hydrochloric acid

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$) in the portion of Mafenide Acetate taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Mafenide Acetate RS in the *Standard solution* (μ g/mL)

C_U = concentration of Mafenide Acetate in the *Sample solution* (μ g/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- RESIDUE ON IGNITION (281):** NMT 0.2%

Standard solution A: 500 μ g/mL of USP Mafenide Acetate RS in methanol

Standard solution D: 500 μ g/mL of USP Mafenide Related Compound A RS in methanol

[NOTE—USP Mafenide Related Compound A RS is 4-formylbenzenesulfonamide.]

Standard solutions: Quantitatively dilute portions of *Standard solution A* with methanol to obtain *Standard solution B* and *Standard solution C*. Similarly, quantitatively dilute portions of *Standard solution D* with metha-

nol to obtain *Standard solution E* and *Standard solution F*. The compositions are shown in Table 1.

Table 1

Standard Solution	Dilution	Concentration (μ g/mL)	Percentage (% for comparison with test specimen)
A	(undiluted)	500	1.0
B	5 in 10	250	0.5
C	1 in 5	100	0.2
D	(undiluted)	500	1.0
E	5 in 10	250	0.5
F	1 in 5	100	0.2

Sample solution: 50 mg/mL of Mafenide Acetate in methanol

Identification solution: 500 μ g/mL from the *Sample solution* in methanol

Ninhydrin solution: 300 mg of ninhydrin in 100 mL of butyl alcohol. Add 3 mL of glacial acetic acid.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: Ethyl acetate, methanol, and isopropylamine (77:20:3)

Spray reagent: *Ninhydrin solution*

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Identification solution*

Apply the *Samples* separately to the chromatographic plate. Position the plate in a chromatographic chamber, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm, circulating air. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Sample solution* at the R_f value corresponding to those of the principal spots in the chromatograms of *Standard solutions D*, *E*, and *F*. Spray the plate with *Spray reagent*, heat the plate at 105° for 5 min, and examine the plate. Compare the intensities of any secondary spots observed in the chromatogram of the *Sample solution* to those of the principal spots in the chromatograms of *Standard solutions A*, *B*, and *C*.

Acceptance criteria: No secondary spot, observed by both visualizations, from the chromatogram of the *Sample solution* is larger or more intense than the principal spots obtained from *Standard solution B* (0.5%) and *Standard solution E* (0.5%). The sum of the intensities of all secondary spots obtained from the *Sample solution* corresponds to NMT 1.0%.

Mafenide Acetate Cream

DEFINITION

Mafenide Acetate Cream is Mafenide Acetate in a water-miscible, oil-in-water cream base, containing suitable preservatives. It contains NLT 90.0% and NMT 110.0% of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$), in terms of the labeled amount of mafenide ($C_7H_{10}N_2O_2S$).

IDENTIFICATION

- **A. ULTRAVIOLET ABSORPTION (197U)**
Sample solution: Proceed as directed in the Assay.
Acceptance criteria: Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Acetate (191)**
Sample solution: Place about 1 g in a 60-mL separatory funnel, and add 20 mL of chloroform to dissolve it. Add 20 mL of water, shake for 2 min, allow the layers to separate completely, and discard the lower chloroform layer. Repeat this washing with another 20-mL portion of chloroform, and discard the chloroform washing. Centrifuge the aqueous layer. Use a 1-mL aliquot of the supernatant with 2 mL of water for the lanthanum nitrate test and a 3-mL aliquot of the supernatant for the ferric chloride test.
Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Standard solution: 200 μ g/mL of USP Mafenide Acetate RS in 0.01 N hydrochloric acid

Sample solution: Nominally 200 μ g/mL of mafenide acetate prepared as follows. Transfer a portion of Cream containing 100 mg of mafenide acetate to a 60-mL separator, and add 20 mL of chloroform to dissolve it. Add 20 mL of water, shake for 2 min, allow the layers to separate completely, and discard the lower chloroform layer. Repeat this washing with two separate 20-mL portions of chloroform, and discard the chloroform washings. Pass the aqueous phase through a dry filter into a 100-mL volumetric flask. Rinse the separator and the filter with water, passing all rinses through the filter, and add water to volume. Centrifuge 30 mL, then pipet 20 mL of the clear supernatant into a 100-mL volumetric flask. Add 1 mL of 1 N hydrochloric acid, and add water to volume.

Instrumental conditions

Mode: UV

Analytical wavelength: 267 nm

Cell: 1 cm

Blank: 0.01 N hydrochloric acid

Analysis

Samples: Standard solution, Sample solution, and Blank
Calculate the percentage of the labeled amount of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$) in the portion of Cream taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of USP Mafenide Acetate RS in the Standard solution (μ g/mL)

C_U = nominal concentration of mafenide acetate in the Sample solution (μ g/mL)

Acceptance criteria: 90.0%–110.0%

ADDITIONAL REQUIREMENTS

- **USP REFERENCE STANDARDS (11)**
USP Mafenide Acetate RS

Mafenide Acetate for Topical Solution

DEFINITION

Mafenide Acetate for Topical Solution contains NLT 98.0% and NMT 102.0% of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: Dissolve 6.8 g of monobasic potassium phosphate and 1.0 g of sodium 1-hexanesulfonate in 800 mL of water. Adjust with phosphoric acid to a pH of 2.5, and dilute to 1000 mL.

Mobile phase: Acetonitrile and Solution A (1:9)

Standard solution: 1 mg/mL of USP Mafenide Acetate RS in Mobile phase. Sonicate to dissolve if necessary.

Sample solution: Nominally 1 mg/mL of mafenide acetate prepared as follows. Constitute the Topical Solution as directed in the labeling. Transfer a volume of the constituted Topical Solution, equivalent to 25 mg of mafenide acetate, to a 25-mL volumetric flask. Using sonication, dissolve in 12 mL of Mobile phase. Dilute with Mobile phase to volume.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 267 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of mafenide acetate ($C_7H_{10}N_2O_2S \cdot C_2H_4O_2$) in the portion of the constituted Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Mafenide Acetate RS in the Standard solution (mg/mL)

C_U = nominal concentration of mafenide acetate in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

OTHER COMPONENTS

• CONTENT OF ACETIC ACID

Internal standard solution: 0.5% (v/v) of propionic acid in water

Standard stock solution: Transfer 50 mL of water to a 100-mL volumetric flask, insert a stopper, and weigh. Add 0.5 mL of glacial acetic acid to the flask, insert the

stopper, weigh, and calculate, by difference, the amount of acetic acid added. Dilute with water to volume.

Standard solution: 530 µg/mL of acetic acid prepared as follows. Add 10.0 mL of *Standard stock solution* and 10.0 mL of *Internal standard solution* to a 100-mL volumetric flask containing 200 mg of oxalic acid. Dilute with water to volume.

Sample solution: Nominally 2 mg/mL of mafenide acetate prepared as follows. Constitute the Topical Solution as directed in the labeling. Transfer a volume of the constituted Topical Solution, equivalent to 200 mg of mafenide acetate, to a 100-mL volumetric flask containing 200 mg of oxalic acid. Pipet 10.0 mL of *Internal standard solution* into the flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.25-mm × 60-m fused-silica capillary column coated with a 0.5-µm layer of acid-deactivated phase G35

Temperatures

Injection: 250°

Detector: 250°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
150	0	150	11
150	25	240	10
240	25	150	1

Carrier gas: Helium

Flow rate: 40 cm/s

Injection volume: 1 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 3.0 between acetic acid and propionic acid

Relative standard deviation: NMT 6.0% for peak response ratios

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of acetic acid in the portion of the constituted Topical Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of acetic acid to propionic acid from the *Sample solution*

R_S = peak response ratio of acetic acid to propionic acid from the *Standard solution*

C_S = concentration of acetic acid in the *Standard solution* (mg/mL)

C_U = nominal concentration of mafenide acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 22.0%–26.8%

IMPURITIES

• ORGANIC IMPURITIES

Solution A: Dissolve 6.8 g of monobasic potassium phosphate and 1.0 g of sodium 1-hexanesulfonate in 800 mL of water. Adjust with phosphoric acid to a pH of 2.5, and dilute to 1000 mL.

Mobile phase: Acetonitrile and *Solution A* (1:9)

Standard stock solution: 25 µg/mL of USP Mafenide Related Compound A RS in *Mobile phase*

[NOTE—USP Mafenide Related Compound A RS is 4-formylbenzenesulfonamide.]

System suitability solution: 1.0 mg/mL of USP Mafenide Acetate RS and 10 µg/mL of USP Mafenide Related Compound A RS from *Standard stock solution* in *Mobile phase*. Initially dissolve the USP Mafenide Acetate RS using 20% of the final volume by sonication in 2 mL of *Mobile phase*, add the appropriate volume of USP Mafenide Related Compound A RS, and dilute to final volume.

Standard solution A: 5 µg/mL of USP Mafenide Related Compound A RS from *Standard stock solution* in *Mobile phase*

Standard solution B: 1 µg/mL of USP Mafenide Related Compound A RS from *Standard solution A* in *Mobile phase*

Sample solution: Proceed as directed in the Assay.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 267 nm

Column: 4.6-mm × 15-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 3 times the retention time of mafenide

System suitability

Samples: *System suitability solution*, *Standard solution A*, and *Standard solution B*

Suitability requirements

Resolution: NLT 3.0 between mafenide acetate and mafenide related compound A, *System suitability solution*

Tailing factor: NMT 2.0, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution A*

Analysis

Samples: *Mobile phase*, *Standard solution A*, and *Sample solution*

Chromatograph the *Standard solution* and adjust the integration parameters so that the response is 5%–15% of full-scale deflection. Disregard the peaks corresponding to those obtained from the *Mobile phase*. Calculate the percentage of each impurity in the portion of the constituted Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of mafenide related compound A from *Standard solution A*

C_S = concentration of USP Mafenide Related Compound A RS in *Standard solution A* (µg/mL)

C_U = nominal concentration of mafenide acetate in the *Sample solution* (µg/mL)

Acceptance criteria

Individual impurity: NMT 0.5%

Total impurities: NMT 1.0%

SPECIFIC TESTS

• pH (791)

Sample solution: Nominally 100 mg/mL

Acceptance criteria: 6.4–6.8

• WATER DETERMINATION, Method I (921): NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, at controlled room temperature. For prepared solutions, use within 48 h of preparation.

• USP REFERENCE STANDARDS (11)

USP Mafenide Acetate RS

USP Mafenide Related Compound A RS

4-Formylbenzenesulfonamide.

C₇H₇NO₃S 185.20

Magaldrate

Aluminum magnesium hydroxide sulfate ($\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2 \cdot x\text{H}_2\text{O}$).

Aluminum magnesium hydroxide sulfate, hydrate
[74978-16-8].

Anhydrous 1097.38

» Magaldrate is a chemical combination of aluminum and magnesium hydroxides and sulfate, corresponding approximately to the formula:

It contains the equivalent of not less than 90.0 percent and not more than 105.0 percent of $\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—
USP Magaldrate RS

Identification—

A: Dissolve about 600 mg in 20 mL of 3 N hydrochloric acid, add 3 drops of methyl red TS and about 30 mL of water, and heat to boiling. Add 6 N ammonium hydroxide until the color just changes to yellow, continue boiling for 2 minutes, and filter: the filtrate responds to the tests for *Magnesium* (191).

B: Wash the precipitate obtained in *Identification* test A with 50 mL of hot ammonium chloride solution (1 in 50), then dissolve the precipitate in 15 mL of 3 N hydrochloric acid: the solution responds to the tests for *Aluminum* (191).

C: Its X-ray diffraction pattern (see *X-ray Diffraction* (941)) in the d-spacings region below 0.257 nm (2.57 angstrom units) conforms to that of USP Magaldrate RS.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the test for absence of *Escherichia coli*.

Loss on drying (731)—Dry it at 200° for 4 hours: it loses between 10.0% and 20.0% of its weight.

Soluble chloride—Boil 1 g of it, accurately weighed, with 50.0 mL of water for 5 minutes, cool, add water to restore the original volume, mix, and filter. To 25.0 mL of the filtrate add 0.1 mL of potassium chromate TS, and titrate with 0.10 N silver nitrate until a persistent pink color is obtained: not more than 5.0 mL of 0.10 N silver nitrate is required (3.5%).

Soluble sulfate (221)—A 2.5-mL portion of the filtrate obtained in the test for *Soluble chloride* shows no more sulfate than corresponds to 1.0 mL of 0.020 N sulfuric acid (1.9%).

Sodium—Transfer 2 g of it, accurately weighed, to a 100-mL volumetric flask, place in an ice bath, add 5 mL of nitric acid, and swirl to dissolve. Allow to warm to room temperature, dilute with water to volume, and mix. Filter, if necessary, to obtain a clear solution. Dilute 10.0 mL of the filtrate with water to 100.0 mL: the emission intensity of this solution, determined with a suitable flame photometer at 589 nm and corrected for background transmission at 580 nm, is not greater than that produced by a standard containing 2.2 µg of Na per mL, similarly measured (0.11%).

Arsenic, Method I (211): 8 ppm.

Delete the following:

• **Heavy metals** (231)—Dissolve 330 mg in 10 mL of 3 N hydrochloric acid, filter if necessary to obtain a clear solu-

tion, and dilute with water to 25 mL: the limit is 0.006%.

• (Official 1-Jan-2018)

Magnesium hydroxide content—Dissolve about 100 mg, accurately weighed, in 3 mL of dilute hydrochloric acid (1 in 10), and dilute with water to about 200 mL. Add, with stirring, 1 g of ammonium chloride, 20 mL of triethanolamine, 10 mL of ammonia–ammonium chloride buffer TS, and 0.1 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of $\text{Mg}(\text{OH})_2$: between 49.2% and 66.6% of $\text{Mg}(\text{OH})_2$ is found, calculated on the dried basis.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Procedure—Dissolve about 100 mg of Magaldrate, accurately weighed, in 3 mL of dilute hydrochloric acid (1 in 10), and dilute with water to about 30 mL. Add, with stirring, 25.0 mL of *Edetate disodium titrant*, mix, and allow to stand for 5 minutes. Then add 20 mL of acetic acid–ammonium acetate buffer TS, 60 mL of alcohol, and 2 mL of dithizone TS, and titrate with 0.05 M zinc sulfate to a bright rose-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 3.900 mg of $\text{Al}(\text{OH})_3$: between 32.1% and 45.9% of $\text{Al}(\text{OH})_3$ is found, calculated on the dried basis.

Sulfate content—

Chromatographic column—Transfer 15 mL of strongly acidic 50- to 100-mesh styrene-divinylbenzene cation-exchange resin to a 1-cm inside diameter glass column. Wash the resin with 30 mL of water.

Indicator solution—Prepare a solution in water containing 2 mg of sodium alizarinsulfonate per mL.

Magnesium acetate solution—Dissolve 26.8 g of magnesium acetate in 500 mL of water.

0.05 M Barium chloride—Dissolve 12.2 g of barium chloride in about 900 mL of water, adjust with 1 N hydrochloric acid to a pH of 3.0, dilute with water to 1000 mL, and mix. Standardize this solution as follows: Transfer 10.0 mL of 0.1 N sulfuric acid VS to a 125-mL conical flask. Adjust by adding *Magnesium acetate solution* to a pH of 3.0. Add 25 mL of methanol and 3 or 4 drops of *Indicator solution*. Add from a buret an accurately measured volume of 8 to 9 mL of 0.05 M barium chloride. Add an additional 4 drops of *Indicator solution*, and titrate slowly until the yellow color disappears and a pink tinge is visible. Calculate the molarity of the barium chloride titrant taken by the formula:

$$5(N/V)$$

in which *N* is the normality of the sulfuric acid; and *V* is the volume, in mL, of titrant consumed.

Test preparation—Transfer about 875 mg of Magaldrate, accurately weighed, to a 25-mL volumetric flask. Dissolve in 10 mL of water and 5 mL of glacial acetic acid, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to the chromatographic column and wash the column with 15 mL of water, collecting the eluate in a 125-mL conical flask (*Test preparation*).

Procedure—Add to the *Test preparation* 5 mL of *Magnesium acetate solution*, 32 mL of methanol, and 3 or 4 drops of *Indicator solution*. Add from a buret an accurately measured volume of 5.0 to 5.5 mL of 0.05 M barium chloride. Add an additional 3 drops of *Indicator solution*, and titrate slowly until the yellow color disappears and a pink tinge is visible. Each mL of 0.05 M barium chloride is equivalent to 4.803 mg of sulfate (SO_4): between 16.0% and 21.0% of SO_4 is found, calculated on the dried basis.

Assay—Transfer about 3 g of Magaldrate, accurately weighed, to a 250-mL beaker, add 100.0 mL of 1 N hydrochloric acid VS, and stir until the solution becomes clear.

Titrate the excess acid with 1 N sodium hydroxide VS to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 1 N hydrochloric acid is equivalent to 35.40 mg of $\text{Al}_3\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2$.

Magaldrate Oral Suspension

» Magaldrate Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magaldrate $[\text{Al}_3\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2]$.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Magaldrate RS

Identification—

A: Dissolve an amount of Oral Suspension, equivalent to about 800 mg of magaldrate, in 20 mL of 3 N hydrochloric acid, dilute with water to about 50 mL, add 3 drops of methyl red TS, and proceed as directed in *Identification test A* under *Magaldrate*, beginning with "and heat to boiling."

B: It responds to *Identification test B* under *Magaldrate*.

C: Transfer an amount of Oral Suspension, equivalent to about 1 g of magaldrate, to a 100-mL centrifuge tube. Add about 60 mL of water, cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant. Repeat the washing of the residue with three 60-mL portions of water. Transfer the residue to a 250-mL beaker, and heat on a steam bath to dryness: the X-ray diffraction pattern (see *X-ray Diffraction* (941)), in the d-spacings region below 2.57 angstrom units, of the residue so obtained conforms to that of USP Magaldrate RS.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

Acid-neutralizing capacity (301)—The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.8(0.0282M)$$

in which 0.0282 is the theoretical acid-neutralizing capacity, in mEq per mg, of magaldrate, and M is the quantity, in mg, of the labeled amount of magaldrate.

Magnesium hydroxide content—

Test preparation—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 1 g of magaldrate, to a 100-mL volumetric flask, add 30 mL of dilute hydrochloric acid (1 in 10), shake to dissolve, dilute with water to volume, and mix.

Procedure—Transfer 10.0 mL of *Test preparation* to a 400-mL beaker, and proceed as directed in the test for *Magnesium hydroxide content* under *Magaldrate*, beginning with "and dilute with water to about 200 mL." Not less than 492 mg and not more than 666 mg of magnesium hydroxide $[\text{Mg}(\text{OH})_2]$ per g of the labeled amount of magaldrate is found.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Test preparation—Prepare as directed in the test for *Magnesium hydroxide content*.

Procedure—Transfer 10.0 mL of *Test preparation* and 20 mL of water to a 250-mL beaker, and proceed as di-

rected for *Procedure* in the test for *Aluminum hydroxide content* under *Magaldrate*, beginning with "Add, with stirring, 25.0 mL of *Edetate disodium titrant*." Not less than 321 mg and not more than 459 mg of aluminum hydroxide $[\text{Al}(\text{OH})_3]$ per g of the labeled amount of magaldrate is found.

Change to read:

Other requirements—Evaporate a volume of Oral Suspension, equivalent to about 5 g of magaldrate, on a steam bath to dryness: the residue so obtained meets the requirements of the tests for *Arsenic* (Official 1-Jan-2018) under *Magaldrate*.

Assay—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 3 g of magaldrate, to a beaker. Add 100.0 mL of 1 N hydrochloric acid VS, and mix, using a magnetic stirrer to achieve dissolution. Titrate the excess acid with 1 N sodium hydroxide VS to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 1 N hydrochloric acid is equivalent to 35.40 mg of $\text{Al}_3\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2$.

Magaldrate Tablets

» Magaldrate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magaldrate $[\text{Al}_3\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2]$.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Tablets to indicate whether they are to be swallowed or to be chewed.

USP Reference standards (11)—

USP Magaldrate RS

Identification—Transfer a quantity of powdered Tablets, equivalent to about 2 g of magaldrate, to a 100-mL centrifuge tube. Add about 60 mL of water, cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant. Repeat the washing with three more 60-mL portions of water. Transfer the residue to a 250-mL beaker, and heat on a steam bath to dryness: the residue so obtained meets the requirements of the *Identification* tests under *Magaldrate*.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Tablets meet the requirements of the test for absence of *Escherichia coli*.

Disintegration (701): 2 minutes, for Tablets labeled to be swallowed.

Uniformity of dosage units (905): meet the requirements for *Weight Variation*.

Acid-neutralizing capacity—Proceed as directed under *Acid-Neutralizing Capacity* (301). The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.8(0.0282M)$$

in which 0.0282 is the theoretical acid-neutralizing capacity, in mEq per mg, of magaldrate; and M is the quantity, in mg, of the labeled amount of magaldrate.

Magnesium hydroxide content—

Test preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 g of magaldrate, to a

100-mL volumetric flask, add 30 mL of dilute hydrochloric acid (1 in 10), shake for 15 minutes, dilute with water to volume, and mix.

Procedure—Transfer 10.0 mL of *Test preparation* to a 400-mL beaker, and proceed as directed in the test for *Magnesium hydroxide content* under *Magaldrate*, beginning with “and dilute with water to about 200 mL.” Not less than 492 mg and not more than 666 mg of magnesium hydroxide $[\text{Mg}(\text{OH})_2]$ per g of the labeled amount of magaldrate is found.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Test preparation—Prepare as directed in the test for *Magnesium hydroxide content*.

Procedure—Transfer 10.0 mL of *Test preparation* and 20 mL of water to a 250-mL beaker, and proceed as directed for *Procedure* in the test for *Aluminum hydroxide content* under *Magaldrate*, beginning with “Add, with stirring, 25.0 mL of *Edetate disodium titrant*.” Not less than 321 mg and not more than 459 mg of aluminum hydroxide $[\text{Al}(\text{OH})_3]$ per g of the labeled amount of magaldrate is found.

Assay—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 g of magaldrate, to a 200-mL volumetric flask. Add 100.0 mL of 2 N hydrochloric acid VS, and swirl by mechanical means for 30 minutes. Dilute with water to volume, mix, and filter. Transfer 100.0 mL of the filtrate to a beaker. Titrate the excess acid with 1 N sodium hydroxide VS to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 2 N hydrochloric acid is equivalent to 70.80 mg of $\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2$.

Magaldrate and Simethicone Oral Suspension

» Magaldrate and Simethicone Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magaldrate $[\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2]$, and an amount of polydimethylsiloxane $[-(\text{CH}_3)_2\text{SiO}-]_n$ that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in tight containers, and keep from freezing.

USP Reference standards (11)—

USP Magaldrate RS
USP Polydimethylsiloxane RS

Identification—

A: Dissolve an amount of Oral Suspension, equivalent to about 800 mg of magaldrate, in 20 mL of 3 N hydrochloric acid, dilute with water to about 50 mL, add 3 drops of methyl red TS, and proceed as directed in *Identification test A* under *Magaldrate*, beginning with “and heat to boiling.”

B: Wash the precipitate obtained in *Identification test A* with hot ammonium chloride solution (1 in 50), and dissolve the precipitate in hydrochloric acid. Divide this solution into two portions: the dropwise addition of 6 N ammonium hydroxide to one portion yields a gelatinous white precipitate, which does not dissolve in an excess of 6 N ammonium hydroxide. The dropwise addition of 1 N sodium hydroxide to the other portion yields a gelatinous white pre-

cipitate, which dissolves in an excess of 1 N sodium hydroxide, leaving some turbidity.

C: Transfer an amount of Oral Suspension, equivalent to about 1 g of magaldrate, to a 100-mL centrifuge tube. Add about 60 mL of water, insert the cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant. Repeat the washing of the residue with three 60-mL portions of water. Transfer the residue to a 250-mL beaker, and heat on a steam bath to dryness: the X-ray diffraction pattern (see *X-ray Diffraction* (941)), in the d-spacings region below 2.57 angstrom units, of the residue so obtained conforms to that of USP Magaldrate RS.

D: The IR absorption spectrum, in the 7- to 15- μm region, determined in a 0.1-mm cell, of the *Assay preparation* prepared as directed in the *Assay* for polydimethylsiloxane exhibits maxima only at the same wavelengths as that of the *Standard preparation* prepared as directed in the *Assay* for polydimethylsiloxane.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

Acid-neutralizing capacity (301)—The acid capacity by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.8(0.0282M)$$

in which 0.0282 is the theoretical acid-neutralizing capacity, in mEq per mg, of magaldrate; and *M* is the quantity, in mg, of the labeled amount of magaldrate.

Magnesium hydroxide content—

Test preparation—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 1 g of magaldrate, to a 100-mL volumetric flask, add 30 mL of dilute hydrochloric acid (1 in 10), shake to dissolve, dilute with water to volume, and mix.

Procedure—Transfer 10.0 mL of *Test preparation* to a 400-mL beaker, and proceed as directed in the test for *Magnesium hydroxide content* under *Magaldrate*, beginning with “and dilute with water to about 200 mL.” Not less than 492 mg and not more than 666 mg of magnesium hydroxide $[\text{Mg}(\text{OH})_2]$ per g of the labeled amount of magaldrate is found.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Test preparation—Prepare as directed in the test for *Magnesium hydroxide content*.

Procedure—Transfer 10.0 mL of *Test preparation* and 20 mL of water to a 250-mL beaker, and proceed as directed for *Procedure* in the test for *Aluminum hydroxide content* under *Magaldrate*, beginning with “Add, with stirring, 25.0 mL of *Edetate disodium titrant*.” Not less than 321 mg and not more than 459 mg of aluminum hydroxide $[\text{Al}(\text{OH})_3]$ per g of the labeled amount of magaldrate is found.

Change to read:

Other requirements—Evaporate a volume of Oral Suspension, equivalent to about 5 g of magaldrate, on a steam bath to dryness: the residue so obtained meets the requirements of the tests for *Arsenic* (Official: 1-Jan-2018) under *Magaldrate*.

Assay for magaldrate—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 3 g of magaldrate, to a beaker. Add 100.0 mL of 1 N hydrochloric acid VS, and mix, using a magnetic stirrer to achieve dissolution. Titrate the excess acid with 1 N sodium hydroxide VS

to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 1 N hydrochloric acid is equivalent to 35.40 mg of magaldrate $[\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2]$.

Assay for polydimethylsiloxane—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 250 mg of simethicone, to a 200-mL centrifuge bottle. Add an equal volume of hydrochloric acid, swirl to dissolve the Oral Suspension, add 25.0 mL of hexanes, and immediately close the bottle securely with a cap having an inert liner. Shake the bottle for 30 minutes, and centrifuge the mixture until a clear supernatant layer is obtained (*Assay preparation*). Prepare a *Standard preparation* of USP Polydimethylsiloxane RS in hexanes having a known concentration of about 10 mg per mL. Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 0.1-mm cells at the wavelength of maximum absorbance at about 7.9 μm and at the wavelengths of minimum absorbance at about 7.5 μm and 8.3 μm , with a suitable IR spectrophotometer, using hexanes as the blank. Draw a linear baseline between the two minima, and determine the absorbances for the *Standard preparation* and the *Assay preparation* with respect to the baseline, making any necessary correction for the blank. Calculate the quantity, in mg, of $[(\text{CH}_3)_2\text{SiO}]_n$ in the portion of Oral Suspension taken by the formula:

$$25C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Polydimethylsiloxane RS in the *Standard preparation*; and A_U and A_S are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Magaldrate and Simethicone Chewable Tablets

Former Title: *Magaldrate and Simethicone Tablets*

» Magaldrate and Simethicone Chewable Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of magaldrate $[\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2]$, and an amount of polydimethylsiloxane $[(\text{CH}_3)_2\text{SiO}]_n$ that is not less than 85.0 percent and not more than 115.0 percent of the labeled amount of simethicone.

Packaging and storage—Preserve in well-closed containers.

Labeling—Label the Chewable Tablets to indicate that they are to be chewed before being swallowed.

USP Reference standards (11)—

USP Magaldrate RS
USP Polydimethylsiloxane RS

Identification—

A: Transfer a quantity of powdered Chewable Tablets, equivalent to about 2 g of magaldrate, to a 100-mL centrifuge tube. Add about 60 mL of water, cap, and shake for 3 minutes. Centrifuge the suspension, and discard the supernatant. Repeat the washing with three more 60-mL portions of water. Transfer the residue to a 250-mL beaker, and heat on a steam bath to dryness: the residue so obtained meets the requirements of the *Identification* tests under *Magaldrate*.

B: The IR absorption spectrum, in the 7- to 11- μm region, determined in a 0.5-mm cell, of the *Assay preparation* prepared as directed in the *Assay for polydimethylsiloxane*, exhibits maxima only at the same wavelengths as that of the *Standard preparation* containing about 2 mg of USP

Polydimethylsiloxane RS per mL prepared as directed in the *Assay for polydimethylsiloxane*.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—Chewable Tablets meet the requirements of the test for absence of *Escherichia coli*.

Uniformity of dosage units (905): meet the requirements for *Weight Variation* with respect to magaldrate.

Acid-neutralizing capacity—Proceed as directed under *Acid-neutralizing Capacity* (301). The acid consumed by the minimum single dose recommended in the labeling is not less than 5 mEq, and not less than the number of mEq calculated by the formula:

$$0.8(0.0282 M)$$

in which 0.0282 is the theoretical acid-neutralizing capacity, in mEq per mg, of magaldrate, and M is the quantity, in mg, of the labeled amount of magaldrate.

Magnesium hydroxide content—

Test preparation—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 g of magaldrate, to a 100-mL volumetric flask, add 30 mL of dilute hydrochloric acid (1 in 10), shake for 15 minutes, dilute with water to volume, and mix.

Procedure—Transfer 10.0 mL of the *Test preparation* to a 400-mL beaker, and proceed as directed in the test for *Magnesium hydroxide content* under *Magaldrate*, beginning with "and dilute with water to about 200 mL." Not less than 492 mg and not more than 666 mg of magnesium hydroxide $[\text{Mg}(\text{OH})_2]$ per g of the labeled amount of magaldrate is found.

Aluminum hydroxide content—

Edetate disodium titrant—Prepare and standardize as directed in the *Assay* under *Ammonium Alum*.

Test preparation—Prepare as directed in the test for *Magnesium hydroxide content*.

Procedure—Transfer 10.0 mL of *Test preparation* and 20 mL of water to a 250-mL beaker, and proceed as directed for *Procedure* in the test for *Aluminum hydroxide content* under *Magaldrate*, beginning with "Add, with stirring, 25.0 mL of *Edetate disodium*." Not less than 321 mg and not more than 459 mg of aluminum hydroxide $[\text{Al}(\text{OH})_3]$ per g of the labeled amount of magaldrate is found.

Assay for magaldrate—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 6 g of magaldrate, to a 200-mL volumetric flask. Add 100.0 mL of 2 N hydrochloric acid VS, and swirl by mechanical means for 30 minutes. Dilute with water to volume, mix, and filter. Transfer 100.0 mL of the filtrate to a beaker. Titrate the excess acid with 1 N sodium hydroxide VS to a pH of 3.0, determined potentiometrically. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 2 N hydrochloric acid is equivalent to 70.80 mg of $\text{Al}_5\text{Mg}_{10}(\text{OH})_{31}(\text{SO}_4)_2$.

Assay for polydimethylsiloxane—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of simethicone, to a 60-mL separator. Add 10.0 mL of hexanes and 25 mL of 6 N hydrochloric acid, cap the separator, and shake by mechanical means for not less than 2 hours. Allow to stand for about 10 minutes, and drain off as much of the lower, aqueous layer as possible without removing any of the unseparated interphase. Add 25 mL of 4 N sodium hydroxide to the separator, cap it, and shake by mechanical means for 1 hour. Transfer the mixture from the separator to a 50-mL centrifuge tube, cap, and centrifuge to obtain clear layers. Transfer not less than 5 mL of the clear upper hexanes layer to a test tube containing about 0.5 g of anhydrous sodium sulfate. Cap the tube, shake vigorously, and allow to stand to obtain a clear supernatant (*Assay*

preparation). Prepare three *Standard preparations* in hexanes having known concentrations of about 1.6, 2.0, and 2.4 mg of USP Polydimethylsiloxane RS per mL, respectively. Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparations* in a 0.5-mm cell at the wavelength of maximum absorbance at about 1260 cm^{-1} with an IR spectrophotometer, using hexanes as the blank. [NOTE—Between each measurement, rinse the cell with heptane, empty, and dry it.] Plot the absorbances for the *Standard preparations* versus concentration, in mg per mL, of USP Polydimethylsiloxane RS, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, C , in mg per mL, of polydimethylsiloxane in the *Assay preparation*. Calculate the quantity, in mg, of $[-(\text{CH}_3)_2\text{SiO}-]_n$ in the portion of Chewable Tablets taken by multiplying C by 10.

Milk of Magnesia

$\text{Mg}(\text{OH})_2$ 58.32

Magnesium hydroxide.

Magnesium hydroxide [1309-42-8].

» Milk of Magnesia is a suspension of Magnesium Hydroxide. Milk of Magnesia, Double-Strength Milk of Magnesia, and Triple-Strength Milk of Magnesia contain not less than 90.0 percent and not more than 115.0 percent of the labeled amount of $\text{Mg}(\text{OH})_2$, the labeled amount being 80, 160, and 240 mg of $\text{Mg}(\text{OH})_2$ per mL, respectively. It may contain not more than 0.05 percent of a volatile oil or a blend of volatile oils, suitable for flavoring purposes.

Packaging and storage—Preserve in tight containers, preferably at a temperature not exceeding 35°. Avoid freezing.

Labeling—Double- or Triple-Strength Milk of Magnesia is so labeled, or may be labeled as 2× or 3× Concentrated Milk of Magnesia, respectively.

Identification—A solution of the equivalent of 1 g of regular-strength Milk of Magnesia in 2 mL of 3 N hydrochloric acid meets the requirements of the tests for *Magnesium* (191).

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for absence of *Escherichia coli*.

Acid-neutralizing capacity (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.0343M)$$

in which 0.0343 is the theoretical acid-neutralizing capacity, in mEq, of $\text{Mg}(\text{OH})_2$; and M is the quantity, in mg, of $\text{Mg}(\text{OH})_2$ in the specimen tested, based on the labeled quantity.

Soluble alkalies—Centrifuge about 50 mL of Milk of Magnesia. Dilute 5.0 mL of the clear supernatant with 40 mL of water. Add 1 drop of methyl red TS, and titrate the solution with 0.10 N sulfuric acid to the production of a persistent pink color: not more than 1.0 mL of the acid is required. Where the specimen is Double- or Triple-Strength Milk of Magnesia, not more than 2.0 or 3.0 mL of the acid is required, respectively.

Carbonate and acid-insoluble matter—To the equivalent of 1 g of regular-strength Milk of Magnesia add 2 mL of

3 N hydrochloric acid: not more than a slight effervescence occurs, and the solution is not more than slightly turbid.

Assay—Transfer an accurately measured quantity of Milk of Magnesia, previously shaken in its original container, equivalent to about 800 mg of magnesium hydroxide, to a 250-mL volumetric flask. Dissolve in 30 mL of 3 N hydrochloric acid, dilute with water to volume, and mix. Filter, if necessary, and transfer 25.0 mL of the filtrate to a beaker containing 75 mL of water, and mix. Adjust the reaction of the solution with 1 N sodium hydroxide to a pH of 7 (using pH indicator paper; see *Indicator and Test Papers* under *Reagents*, in the section *Reagents, Indicators, and Solutions*), add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of $\text{Mg}(\text{OH})_2$.

Magnesia Tablets

DEFINITION

Magnesia Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of magnesium hydroxide $[\text{Mg}(\text{OH})_2]$.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, *Magnesium* (191)

Sample solution: Crush several Tablets, and dissolve 1 g of the powder in 20 mL of 3 N hydrochloric acid.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 250 mg of magnesium hydroxide, to a 100-mL volumetric flask. Dissolve in 10 mL of 3 N hydrochloric acid, and dilute with water to volume. Filter, if necessary, and transfer 25.0 mL of the filtrate to a beaker containing 75 mL of water.

Analysis: Adjust the reaction of the solution with 1 N sodium hydroxide to a pH of 7 (using pH indicator paper; see *Reagents, Indicators, and Solutions—Indicator and Test Papers*), and add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of $\text{Mg}(\text{OH})_2$.

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• DISINTEGRATION (701)

Time: NMT 10 min, simulated gastric fluid TS being substituted for water in the test

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

SPECIFIC TESTS

• ACID-NEUTRALIZING CAPACITY (301)

Analysis: NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT the number of mEq calculated by the formula:

$$\text{Result} = (F_M \times M) \times 0.8$$

F_M = theoretical acid-neutralizing capacity of $\text{Mg}(\text{OH})_2$, 0.0343 mEq

M = quantity of $\text{Mg}(\text{OH})_2$ in the sample tested, based on the labeled quantity (mg)

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

Magnesium Carbonate

Carbonic acid, magnesium salt, basic; or, Carbonic acid, magnesium salt (1:1), hydrate; Magnesium carbonate, basic; or, Magnesium carbonate (1:1) hydrate [23389-33-5].

Anhydrous 84.31
[546-93-0].

DEFINITION

Magnesium Carbonate is a basic hydrated magnesium carbonate or a normal hydrated magnesium carbonate. It contains the equivalent of NLT 40.0% and NMT 43.5% of magnesium oxide (MgO).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191):** When treated with 3 N hydrochloric acid, it dissolves with effervescence, and the resulting solution meets the requirements.

ASSAY

• PROCEDURE

Sample: 1 g

Analysis: Dissolve the *Sample* in 30.0 mL of 1 N sulfuric acid VS, add methyl orange TS, and titrate the excess acid with 1 N sodium hydroxide VS. Perform the blank determination. Calculate the volume, V_s , of 1 N sulfuric acid, in mL, consumed by the *Sample*:

$$\text{Result} = (V_B - V_A) \times N_{\text{NaOH}}$$

V_B = volume of 1 N sodium hydroxide consumed by the blank determination (mL)

V_A = volume of 1 N sodium hydroxide consumed by the *Sample* (mL)

N_{NaOH} = exact normality of the sodium hydroxide solution

Calculate the volume of 1 N sulfuric acid, V_{Ca} , in mL, consumed by calcium, which is present in the portion of Magnesium Carbonate taken for the Assay:

$$\text{Result} = (W \times L_{\text{Ca}}) / (F_{\text{Ca}} \times 100)$$

W = weight of Magnesium Carbonate taken (mg)

L_{Ca} = content of calcium as determined in the test for Limit of Calcium (%)

F_{Ca} = weight of Ca that is equivalent to each mL of 1 N sulfuric acid, 20.04 mg

Calculate the percentage of magnesium oxide (MgO) in the portion of Magnesium Carbonate taken:

$$\text{Result} = (V_s - V_{\text{Ca}}) \times F_{\text{MgO}} / W \times 100$$

V_s = volume of 1 N sulfuric acid consumed by the *Sample*, as calculated above (mL)

V_{Ca} = volume of 1 N sulfuric acid consumed by calcium, as calculated above (mL)

F_{MgO} = weight of MgO that is equivalent to each mL of 1 N sulfuric acid, 20.15 mg

W = weight of Magnesium Carbonate taken (mg)

Acceptance criteria: 40.0%–43.5% of MgO

IMPURITIES

• SOLUBLE SALTS

Sample: 2.0 g

Analysis: Mix the *Sample* with 100 mL of a mixture of equal volumes of *n*-propyl alcohol and water. Heat the mixture to the boiling point with constant stirring, cool to room temperature, dilute with water to 100 mL, and filter. Evaporate 50 mL of the filtrate on a steam bath to dryness, and dry at 105° for 1 h.

Acceptance criteria: The weight of the residue does not exceed 10 mg (NMT 1.0%).

• ACID-INSOLUBLE SUBSTANCES

Sample: 5.0 g

Analysis: Mix the *Sample* with 75 mL of water, add hydrochloric acid in small portions, with agitation, until no more of the magnesium carbonate dissolves, and boil for 5 min. If an insoluble residue remains, filter, wash well with water until the last washing is free from chloride, and ignite.

Acceptance criteria: The weight of the ignited residue does not exceed 2.5 mg (NMT 0.05%).

• ARSENIC, Method I (211)

Test preparation: 750 mg in 25 mL of 3 N hydrochloric acid

Acceptance criteria: NMT 4 ppm

• LIMIT OF CALCIUM

[NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a calcium standard stock solution is described below. Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

Dilute hydrochloric acid: Dilute 100 mL of hydrochloric acid with water to 1000 mL.

Lanthanum solution: To 58.65 g of lanthanum oxide add 400 mL of water, and add, gradually with stirring, 250 mL of hydrochloric acid. Stir until dissolved, and dilute with water to 1000 mL.

Standard solutions: Transfer 249.7 mg of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, to a 100-mL volumetric flask. Dissolve in a minimum amount of hydrochloric acid, and dilute with water to volume. Transfer 1.0, 5.0, 10.0, and 15.0 mL of this stock solution to separate 1000-mL volumetric flasks, each containing 20 mL of *Lanthanum solution* and 40 mL of *Dilute hydrochloric acid*. Dilute with water to volume. These *Standard solutions* contain 1.0, 5.0, 10.0, and 15.0 µg/mL of calcium, respectively.

Blank solution: Transfer 4 mL of *Lanthanum solution* and 10 mL of *Dilute hydrochloric acid* to a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 250 mg of Magnesium Carbonate to a beaker, add 30 mL of *Dilute hydrochloric acid*, and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of *Lanthanum solution*, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analytical wavelength: Calcium emission line at 422.7 nm

Analysis

Samples: *Standard solutions*, *Blank solution*, and *Sample solution*

Using the *Blank solution* as blank, determine the concentration, C , in µg/mL, of calcium in the *Sample solution* using the calibration graph.

Calculate the percentage of calcium in the portion of Magnesium Carbonate taken:

$$\text{Result} = (V/W \times C \times F) \times 100$$

V = volume of the *Sample solution* (mL)

W = weight of Magnesium Carbonate taken (mg)

C = as defined above

F = conversion factor from µg/mL to mg/mL, 0.001

Acceptance criteria: NMT 0.45%

Delete the following:

• HEAVY METALS, Method I (231)

Test preparation: Dissolve 0.67 g in 10 mL of 3 N hydrochloric acid in a suitable crucible, and evaporate the solution on a steam bath to dryness. Ignite at $550 \pm 25^\circ$ until all carbonaceous material is consumed. Dissolve the residue in 15 mL of water and 5 mL of hydrochloric acid, and evaporate to dryness. Toward the end of the evaporation, stir frequently to disintegrate the residue so that finally a dry powder is obtained. Dissolve the residue in 20 mL of water, and evaporate in the same manner as before to dryness. Redissolve the residue in 20 mL of water, filter, if necessary, and add to the filtrate 2 mL of 1 N acetic acid and water to make 25 mL.

Acceptance criteria: NMT 30 ppm (Official 1-Jan-2018)

• IRON (241)

Test preparation: Boil 50 mg with 5 mL of 2 N nitric acid for 1 min. Cool, dilute with water to 45 mL, add 2 mL of hydrochloric acid, and mix.

Acceptance criteria: NMT 200 ppm

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the test for absence of *Escherichia coli*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Magnesium Carbonate and Citric Acid for Oral Solution

DEFINITION

Magnesium Carbonate and Citric Acid for Oral Solution contains a dry mixture of Magnesium Carbonate and Citric Acid that when constituted as directed in the labeling yields a solution that contains NLT 90.0% and NMT 110.0% of the labeled amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: Meets the requirements
- **B.** The retention time of the citrate peak of the *Sample solution* corresponds to that of *Standard solution 1*, as obtained in the test for *Content of Anhydrous Citric Acid*.

ASSAY

• PROCEDURE

Sample solution: Transfer a volume of constituted oral solution, equivalent to 18.7 g of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$), to a 1000-mL volumetric flask. Add 200 mL of 1 N hydrochloric acid, swirl, and allow to stand for 10 min. Dilute with water to volume. Stir by mechanical means for 30 min.

Analysis: Transfer 10.0 mL of the *Sample solution* to a 250-mL beaker. Add 10 mL of ammonia-ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS until the last hint of violet disappears (blue endpoint). Each mL of 0.05 M edetate disodium is equivalent to 7.520 mg of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• CONTENT OF ANHYDROUS CITRIC ACID

Mobile phase, Standard solution 1, Chromatographic system, and System suitability: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*.

Sample solution: Transfer an appropriate volume of the constituted oral solution into a suitable volumetric flask, and proceed as directed for the *Sample solution* in *Assay for Citric Acid/Citrate and Phosphate (345)*, *Assay Preparation for Citric Acid/Citrate Assay*.

Analysis

Samples: *Standard solution 1* and *Sample solution*
Proceed as directed for *Assay for Citric Acid/Citrate and Phosphate (345)*, *Procedure*.

Calculate the percentage of anhydrous citric acid ($C_6H_8O_7$) in relation to the labeled amount of magnesium citrate in the volume of constituted oral solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of citrate from the *Sample solution*

r_S = peak area of citrate from *Standard solution 1*

C_S = concentration of citrate in *Standard solution 1* (mg/mL)

C_U = nominal concentration of magnesium citrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous citric acid, 192.12

M_{r2} = molecular weight of citrate ($C_6H_5O_7$), 189.10

Acceptance criteria: 76.6%–107.8% of the labeled amount of magnesium citrate

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES

• CHLORIDE AND SULFATE, Chloride (221)

Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (NMT 0.01%).

• CHLORIDE AND SULFATE, Sulfate (221)

Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (NMT 0.015%).

• TARTARIC ACID

Sample solution: Constitute as directed in the labeling.
Analysis: To 10 mL of *Sample solution* in a test tube, add 1 mL of glacial acetic acid and 3 mL of a solution of potassium acetate (1 in 2). Shake the mixture vigorously, then gently rub the inner wall of the test tube with a glass rod for a few min, and allow to stand for 1 h.

Acceptance criteria: No white, crystalline precipitate soluble in 6 N ammonium hydroxide is formed.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the test for absence of *Escherichia coli* and *Salmonella* species.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label contains directions for constitution of the powder and states the equivalent amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$) in a given volume of the oral solution obtained after constitution.

- **USP REFERENCE STANDARDS (11)**
USP Citric Acid RS

Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution

DEFINITION

Magnesium Carbonate, Citric Acid, and Potassium Citrate for Oral Solution contains a dry mixture of Magnesium Carbonate, Citric Acid, and Potassium Citrate that when constituted as directed in the labeling yields a solution that contains NLT 90.0% and NMT 110.0% of the labeled amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: Meets the requirements
- **B.** The retention time of the citrate peak of the *Sample solution* corresponds to that of *Standard solution 1*, as obtained in the test for *Content of Anhydrous Citric Acid*.

ASSAY

• PROCEDURE

Sample solution: Transfer a volume of constituted oral solution, equivalent to 1.9 g of magnesium citrate to a 100-mL volumetric flask and dilute with water to volume.

Analysis: Transfer 10.0 mL of the *Sample solution* to a beaker. While stirring, add 10 mL of ammonia-ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS until the last hint of violet disappears (blue endpoint). Each mL of 0.05 M edetate disodium is equivalent to 7.520 mg of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• CONTENT OF ANHYDROUS CITRIC ACID

Mobile phase, Chromatographic system, and System suitability: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate (345)*.

Standard solution: 0.02 mg/mL of anhydrous citric acid, from USP Citric Acid RS in a freshly prepared 1 mM sodium hydroxide

Sample solution: Transfer a volume of constituted oral solution equivalent to 500 mg of magnesium citrate, to a suitable volumetric flask, and dilute quantitatively, and stepwise if necessary, with a freshly prepared 1 mM sodium hydroxide to obtain a solution having a concentration of 0.02 mg/mL of magnesium citrate, based on the label claim. Pass through a filter of 0.5- μ m or finer pore size, and use the filtrate.

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of anhydrous citric acid ($C_6H_8O_7$) in relation to the labeled amount of magnesium citrate in the volume of constituted oral solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak area of citrate from the *Sample solution*
 r_S = peak area of citrate from the *Standard solution*
 C_S = concentration of citrate in the *Standard solution* (mg/mL)
 C_U = nominal concentration of magnesium citrate in the *Sample solution* (mg/mL)

Acceptance criteria: 126.1%–154.4% of the labeled amount of magnesium citrate

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride (221)**
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (NMT 0.01%).
- **CHLORIDE AND SULFATE, Sulfate (221)**
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (NMT 0.015%).
- **TARTARIC ACID**
Sample solution: Constitute as directed in the labeling.
Analysis: To 10 mL of *Sample solution* in a test tube, add 1 mL of glacial acetic acid and 3 mL of a solution of potassium acetate (1 in 2). Shake the mixture vigorously, then gently rub the inner wall of the test tube with a glass rod for a few min, and allow to stand for 1 h.
Acceptance criteria: No white, crystalline precipitate soluble in 6 N ammonium hydroxide is formed.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. It meets the requirements of the test for absence of *Escherichia coli*.
- **pH (791)**
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: 3.3–4.3

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, single-dose containers. Store at controlled room temperature.
- **LABELING:** The label specifies the directions for the constitution of the powder and states the equivalent amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).
- **USP REFERENCE STANDARDS (11)**
USP Citric Acid RS

Magnesium Carbonate and Sodium Bicarbonate for Oral Suspension

» Magnesium Carbonate and Sodium Bicarbonate for Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of $MgCO_3$ and $NaHCO_3$. It may contain suitable flavors.

Packaging and storage—Preserve in tight containers.

Identification—

A: Place about 1 g in a flask equipped with a stopper and glass tubing, the tip of which is immersed in calcium hydroxide TS in a test tube. Add 5 mL of 3 N hydrochloric acid to the flask, and immediately insert the stopper: gas evolves in the flask and a precipitate is formed in the test tube.

B: The solution remaining in the flask responds to the tests for *Magnesium (191)* and for *Sodium (191)*.

Minimum fill (755): meets the requirements.

Acid-neutralizing capacity (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recom-

mended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.024M) + 0.8(0.0119S)$$

in which 0.024 and 0.0119 are the theoretical acid-neutralizing capacities, in mEq, of MgCO_3 and NaHCO_3 , respectively; and M and S are the quantities, in mg, of MgCO_3 and NaHCO_3 in the specimen tested, based on the labeled quantities.

Assay for magnesium carbonate—Transfer an accurately weighed portion of Magnesium Carbonate and Sodium Bicarbonate for Oral Suspension, equivalent to about 4.2 g of MgCO_3 , to a 500-mL volumetric flask. Add 200 mL of 1 N hydrochloric acid, and mix. When dissolved, dilute with water to volume, and mix. Transfer 10.0 mL of this stock solution to a suitable container, dilute with water to 100 mL, add 10 mL of ammonia-ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium consumed is equivalent to 4.216 mg of MgCO_3 .

Assay for sodium bicarbonate—

Standard preparations—Dissolve a suitable quantity of sodium chloride, previously dried at 125° for 30 minutes and accurately weighed, in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 600 μg per mL. On the day of use, further dilute this solution quantitatively with water to obtain three solutions containing 6.0, 12.0, and 18.0 μg of sodium chloride per mL, respectively.

Assay preparation—Transfer an accurately measured volume of the stock solution remaining from the Assay for magnesium carbonate, equivalent to about 180 mg of NaHCO_3 , to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL of the resulting solution to a 1000-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the Standard preparations and the Assay preparation at the sodium emission line at about 589.0 nm, with a suitable atomic absorption spectrophotometer (see Atomic Absorption Spectroscopy (852)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using water as the blank. Plot the absorbances of the Standard preparations versus concentration, in μg of sodium chloride per mL, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in μg per mL, of sodium chloride equivalent in the Assay preparation. Calculate the quantity, in g, of NaHCO_3 in the portion of Magnesium Carbonate and Sodium Bicarbonate for Oral Suspension taken by the formula:

$$(84.01 / 58.44)(C / V)$$

in which 84.01 and 58.44 are the molecular weights of sodium bicarbonate and sodium chloride, respectively; C is the concentration, in μg per mL, of sodium chloride equivalent in the Assay preparation; and V is the volume, in mL, of the stock solution remaining from the Assay for magnesium carbonate taken.

Magnesium Chloride

$\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$	203.30
Magnesium chloride, hexahydrate [7791-18-6].	
Anhydrous	95.21
[7786-30-3].	

DEFINITION

Magnesium Chloride contains NLT 98.0% and NMT 101.0% of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$.

IDENTIFICATION

A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

Sample solution: 50 mg/mL

B. IDENTIFICATION TESTS—GENERAL, Chloride (191)

Sample solution: 50 mg/mL

[NOTE—Acidify the Sample solution with diluted nitric acid before adding 6 N ammonium hydroxide.]

ASSAY

PROCEDURE

Sample: 450 mg

Analysis: Dissolve the Sample in 25 mL of water, add 5 mL of ammonia-ammonium chloride buffer TS and 0.1 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M disodium edetate is equivalent to 10.17 mg of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$.

Acceptance criteria: 98.0%–101.0%

IMPURITIES

INSOLUBLE MATTER

Sample: 20 g

Analysis: Dissolve the Sample in 200 mL of water, heat to boiling, and digest in a covered beaker on a steam bath for 1 h. Filter through a tared filtering crucible, wash thoroughly, dry at 115° , and determine the weight of the residue.

Acceptance criteria: NMT 0.005%

CHLORIDE AND SULFATE, Sulfate (221)

Sample: 10 g

Acceptance criteria: It shows no more sulfate than corresponds to 0.50 mL of 0.020 N sulfuric acid (0.005%).

BARIUM

Sample: 1 g

Analysis: Dissolve the Sample in 10 mL of water, and add 1 mL of 2 N sulfuric acid.

Acceptance criteria: No turbidity is produced within 2 h.

LIMIT OF CALCIUM

[NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a calcium standard stock solution is described below. Concentrations of the Standard solutions and the Sample solution may be modified to fit the linear or working range of the instrument.]

Dilute hydrochloric acid: Dilute 100 mL of hydrochloric acid with water to 1000 mL.

Lanthanum solution: To 58.65 g of lanthanum oxide add 400 mL of water, and add, gradually with stirring, 250 mL of hydrochloric acid. Stir until dissolved, and dilute with water to 1000 mL.

Standard solutions: Transfer 249.7 mg of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, to a 100-mL volumetric flask. Dissolve in a minimum amount of hydrochloric acid, and dilute with water to volume. Transfer 1.0, 5.0, 10.0, and 15.0 mL of this stock solution to separate 1000-mL volumetric flasks, each containing 20 mL of Lanthanum solution and 40 mL of Dilute hydrochloric acid. Dilute with water to volume. These Standard solutions contain 1.0, 5.0, 10.0, and 15.0 μg /mL of calcium, respectively.

Blank solution: Transfer 4 mL of Lanthanum solution and 10 mL of Dilute hydrochloric acid to a 200-mL volumetric flask, and dilute with water to volume.

Sample solution: Transfer 10.0 g of Magnesium Chloride to a 200-mL volumetric flask, and add water to dissolve. Add 4 mL of Lanthanum solution, and dilute with water to volume.

Blank solution: Transfer 4 mL of *Lanthanum solution* and 10 mL of *Dilute hydrochloric acid* to a 200-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide-acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Determine the concentration, *C*, in µg/mL, of calcium in the *Sample solution* using the calibration graph.

Calculate the percentage of calcium in the portion of Magnesium Citrate taken:

$$\text{Result} = (V/W \times C \times F) \times 100$$

V = volume of the *Sample solution* (mL)

W = weight of Magnesium Citrate taken (mg)

C = concentration of calcium in the *Sample solution* (µg/mL)

F = conversion from µg/mL to mg/mL, 0.001

Acceptance criteria: NMT 1.0% on the dried basis

SPECIFIC TESTS

• **pH (791):** 5.0–9.0, in a suspension (50 mg/mL)

• **LOSS ON DRYING (731)** Dry 1 g in a mechanical convection oven at 135° for 16 h, then to constant weight: it loses NMT 29% of its weight, except that where it is labeled as anhydrous, it loses NMT 2.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** Magnesium Citrate that loses NMT 2.0% of its weight in the test for *Loss on Drying* may be labeled as Anhydrous Magnesium Citrate.

Magnesium Citrate Oral Solution

DEFINITION

Magnesium Citrate Oral Solution is a sterilized or pasteurized solution containing NLT 7.59 g of anhydrous citric acid (C₆H₈O₇) and an amount of magnesium citrate equivalent to NLT 1.55 g and NMT 1.9 g of magnesium oxide (MgO) in each 100 mL of Oral Solution.

Prepare Magnesium Citrate Oral Solution as follows.

Magnesium Carbonate	15 g
Anhydrous Citric Acid	27.4 g
Syrup	60 mL
Talc	5 g
Lemon Oil	0.1 mL
Potassium Bicarbonate	2.5 g
Purified Water, a sufficient quantity to make	350 mL

Dissolve the *Anhydrous Citric Acid* in 150 mL of hot *Purified Water* in a suitable dish, slowly add the *Magnesium Carbonate* previously mixed with 100 mL of *Purified Water*, and stir until it is dissolved. Add the *Syrup*, heat the mixed liquids to the boiling point, and immediately add the *Lemon Oil* previously triturated with *Talc*. Filter the

mixture, while hot, into a strong bottle of suitable capacity previously rinsed with boiling *Purified Water*. Add boiled *Purified Water* to bring the preparation to final volume. Use *Purified Cotton* as a stopper for the bottle, and allow to cool. Add the *Potassium Bicarbonate*, and immediately insert the stopper in the bottle securely. Shake the solution occasionally until the *Potassium Bicarbonate* is dissolved, cap the bottle, and sterilize or pasteurize the solution.

Alternatively, 30 g of citric acid containing 1 molecule of water of hydration, equivalent to 27.4 g of *Anhydrous Citric Acid*, may be used in the foregoing formula. In this process, replace the 2.5 g of *Potassium Bicarbonate* with 2.1 g of sodium bicarbonate, preferably in tablet form. The Oral Solution may be further carbonated by the use of carbon dioxide under pressure.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191):**

Meets the requirements

• **B.**

Sample: 5 mL

Analysis: To the *Sample* add 1 mL of potassium permanganate TS and 5 mL of mercuric sulfate TS, and heat the solution.

Acceptance criteria: A white precipitate is formed.

ASSAY

• **CITRIC ACID**

Mobile phase, Standard preparation 1, and Chromatographic system: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345).

Assay preparation: Transfer 10 mL of Oral Solution that has been previously freed from excessive carbon dioxide by repeated pouring to a suitable volumetric flask, and proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Citric Acid/Citrate and Phosphate*.

Analysis: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345), *Procedure*.

Calculate the quantity, *g*, of anhydrous citric acid (C₆H₈O₇) in 100 mL of Oral Solution:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times D \times (M_{r1}/M_{r2}) \times F$$

r_U = peak area of citrate from the *Assay preparation*

r_S = peak area of citrate from *Standard preparation*

C_S = concentration of citrate in *Standard preparation 1* (µg/mL)

V = final volume of Oral Solution, 100 mL

D = dilution factor

M_{r1} = molecular weight of citric acid (C₆H₈O₇), 192.12

M_{r2} = molecular weight of citrate (C₆H₅O₇), 189.10

F = conversion factor, 10⁻⁶ g/µg

Acceptance criteria: NLT 7.59 g in 100 mL of Oral Solution

• **MAGNESIUM OXIDE**

Sample: 50.0 mL of Oral Solution that has been previously freed from excessive carbon dioxide by repeated pouring

Analysis: Transfer the *Sample* to a 100-mL volumetric flask, and dilute with water to volume. Transfer 5.0 mL of the resulting solution to a beaker containing 150 mL of water heated to 70°–80°, and add 1 mL of ammonium chloride TS and 3 mL of ammonium hydroxide. Mix, and slowly add 8 mL of 8-hydroxyquinoline TS with stirring. After standing for 30 min, filter through a sintered-glass crucible, previously dried and weighed, and wash the precipitate with ten 10-mL portions of water. Dry the crucible and contents at 105° for 3 h, cool, and weigh. Determine the equivalent of magnesium oxide (MgO) in 100 mL of Oral Solution by multi-

plying the weight of $C_{18}H_{12}MgN_2O_2 \cdot 2H_2O$ so obtained by 4.624.

Acceptance criteria: 1.55–1.9 g in 100 mL of Oral Solution

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride** (221)
Sample: 2.0 mL
Acceptance criteria: 0.01%; it shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid.
- **CHLORIDE AND SULFATE, Sulfate** (221)
Sample: 2.0 mL
Acceptance criteria: 0.015%; it shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid.
- **TARTARIC ACID**
Sample: 10 mL
Analysis: Place the *Sample* in a test tube, add 1 mL of glacial acetic acid and 3 mL of a solution of potassium acetate (1 in 2), shake the mixture vigorously, then gently rub the inner wall of the test tube with a glass rod for a few min, and allow to stand for 1 h.
Acceptance criteria: No white, crystalline precipitate soluble in 6 N ammonium hydroxide is formed.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in bottles NLT 200 mL in capacity. Store at controlled room temperature or in a cool place.
- **USP REFERENCE STANDARDS** (11)
USP Citric Acid RS

Magnesium Citrate for Oral Solution

DEFINITION

Magnesium Citrate for Oral Solution, when constituted as directed in the labeling, yields a solution that contains NLT 90.0% and NMT 110.0% of the labeled amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium** (191)
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: Meets the requirements
- **B.** The retention time of the citrate peak of the *Sample solution* corresponds to that of *Standard solution 1*, as obtained in the test for *Content of Anhydrous Citric Acid*.

ASSAY

• PROCEDURE

Sample solution: Transfer a volume of constituted oral solution, equivalent to 18.7 g of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$), to a 1000-mL volumetric flask. Add 200 mL of 1 N hydrochloric acid, swirl, and allow to stand for 10 min. Dilute with water to volume. Stir by mechanical means for about 30 min.

Analysis: Transfer 10.0 mL of the *Sample solution* to a 250-mL beaker. Add 10 mL of ammonia–ammonium chloride buffer TS, 5 mL of triethanolamine, and 0.3 mL of eriochrome black TS. Titrate with 0.05 M edetate disodium VS until the last hint of violet disappears (blue endpoint). Each mL of 0.05 M edetate disodium is equivalent to 7.520 mg of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$).

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• CONTENT OF ANHYDROUS CITRIC ACID

Mobile phase, Standard solution 1, Chromatographic system, and System suitability: Proceed as directed in *Assay for Citric Acid/Citrate and Phosphate* (345).

Sample solution: Transfer an appropriate volume of the constituted oral solution into a suitable volumetric flask, and proceed as directed for the *Sample solution* in *Assay for Citric Acid/Citrate and Phosphate* (345), *Assay Preparation for Citric Acid/Citrate Assay*.

Analysis

Samples: *Standard solution 1* and *Sample solution* Proceed as directed for *Assay for Citric Acid/Citrate and Phosphate* (345), *Procedure*.

Calculate the percentage of anhydrous citric acid ($C_6H_8O_7$) in relation to the labeled amount of magnesium citrate in the volume of constituted oral solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak area of citrate from the *Sample solution*

r_S = peak area of citrate from *Standard solution 1*

C_S = concentration of citrate in *Standard solution 1* (mg/mL)

C_U = nominal concentration of magnesium citrate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous citric acid, 192.12

M_{r2} = molecular weight of citrate ($C_6H_5O_7$), 189.10

Acceptance criteria: 76.6%–93.7% of the labeled amount of magnesium citrate

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride** (221)
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more chloride than corresponds to 0.30 mL of 0.020 N hydrochloric acid (NMT 0.01%).
- **CHLORIDE AND SULFATE, Sulfate** (221)
Sample solution: Constitute as directed in the labeling.
Acceptance criteria: A 2.0-mL portion of *Sample solution* shows no more sulfate than corresponds to 0.30 mL of 0.020 N sulfuric acid (NMT 0.015%).
- **TARTARIC ACID**
Sample solution: Constitute as directed in the labeling.
Analysis: To 10 mL of *Sample solution* in a test tube, add 1 mL of glacial acetic acid and 3 mL of a solution of potassium acetate (1 in 2). Shake the mixture vigorously, then gently rub the inner wall of the test tube with a glass rod for a few min, and allow to stand for 1 h.
Acceptance criteria: No white, crystalline precipitate soluble in 6 N ammonium hydroxide is formed.

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the test for absence of *Escherichia coli* and *Salmonella* species.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label contains directions for constitution of the powder and states the equivalent amount of magnesium citrate ($C_{12}H_{10}Mg_3O_{14}$) in a given volume of the oral solution obtained after constitution.
- **USP REFERENCE STANDARDS** (11)
USP Citric Acid RS

Magnesium Gluconate

$C_{12}H_{22}MgO_{14}$ 414.60

$C_{12}H_{22}MgO_{14} \cdot 2H_2O$ 450.64

D-Gluconic acid, magnesium salt (2:1), hydrate;
Magnesium D-gluconate (1:2) hydrate;
Magnesium D-gluconate (1:2) dihydrate [59625-89-7].
Anhydrous [3632-91-5].

DEFINITION

Magnesium Gluconate contains NLT 98.0% and NMT 102.0% of anhydrous magnesium gluconate ($C_{12}H_{22}MgO_{14}$), calculated on the anhydrous basis.

IDENTIFICATION

- A. IDENTIFICATION TESTS—GENERAL, Magnesium (191):** A 100-mg/mL solution meets the requirements.

- B. THIN-LAYER CHROMATOGRAPHY**

Standard solution: 10 mg/mL of USP Potassium Gluconate RS

Sample solution: 10 mg/mL of Magnesium Gluconate, heating in a water bath at 60°, if necessary, to dissolve

Chromatographic system
(See Chromatography (621), Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 5 μ L

Developing solvent system: Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

Spray reagent: Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

Analysis

Samples: Standard solution and Sample solution

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with the Spray reagent. Heat the plate at 110° for about 10 min.

Acceptance criteria: The principal spot of the Sample solution corresponds in color, size, and R_f value to that of the Standard solution.

ASSAY

PROCEDURE

Sample: 800 mg of Magnesium Gluconate

Blank: 20 mL of water

Titrimetric system

(See Titrimetry (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Dissolve the Sample in 20 mL of water. Add 5 mL of ammonia-ammonium chloride buffer TS and 0.1 mL of eriochrome black TS. Titrate with Titrant to a blue endpoint. Perform the Blank determination. Calculate the percentage of magnesium gluconate ($C_{12}H_{22}MgO_{14}$) in the Sample taken:

$$\text{Result} = \{[(V_S - V_B) \times M \times F] / W\} \times 100\}$$

V_S = Titrant volume consumed by the Sample (mL)

V_B = Titrant volume consumed by the Blank (mL)

M = Titrant molarity (mM/mL)

F = equivalency factor, 414.6 mg/mM

W = Sample weight (mg)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- CHLORIDE AND SULFATE, Chloride (221)**

Standard solution: 0.7 mL of 0.020 N hydrochloric acid

Sample: 1.0 g

Acceptance criteria: NMT 0.05%

- CHLORIDE AND SULFATE, Sulfate (221)**

Standard solution: 1.0 mL of 0.020 N sulfuric acid

Sample: 2.0 g

Acceptance criteria: NMT 0.05%

Delete the following:

- HEAVY METALS (231)**

Test preparation: 1.0 g in 10 mL of water. Add 6 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

- REDUCING SUBSTANCES**

Sample: 1.0 g of Magnesium Gluconate

Blank: 10 mL of water

Titrimetric system

(See Titrimetry (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Back titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the Sample to a 250-mL conical flask, dissolve in 10 mL of water, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of Titrant, and 10 mL of 3 N hydrochloric acid, and titrate with Back titrant, adding 3 mL of starch TS as the endpoint is approached. Perform the Blank determination.

Calculate the percentage of reducing substances (as dextrose) in the Sample taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

V_B = Back titrant volume consumed by the Blank (mL)

V_S = Back titrant volume consumed by the Sample (mL)

N = Back titrant normality (mEq/mL)

F = equivalency factor, 27 mg/mEq

W = Sample weight (mg)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

- PH (791)**

Sample solution: 50 mg/mL

Acceptance criteria: 6.0–7.8

- WATER DETERMINATION, Method 1b (921)**

Test preparation: Proceed as directed in the chapter. Allow 30 min for solubilization of Magnesium Gluconate and for the reaction to reach completion.

Blank: Use the same volume of Reagent as that of the Test preparation but without the specimen.

Analysis

Samples: Test preparation and Blank

Calculate the water content, in mg, of the Magnesium Gluconate taken:

$$\text{Result} = F \times (X_B - X) \times R$$

X_B = volume of standardized Water-Methanol Solution required to neutralize the unconsumed Reagent in the Blank determination (mL)

The other terms are as defined in Water Determination, Method 1b (921).

Acceptance criteria: 3.0%–12.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Potassium Gluconate RS

Magnesium Gluconate Tablets

DEFINITION

Magnesium Gluconate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of magnesium gluconate ($C_{12}H_{22}MgO_{14}$).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**
Sample solution: A filtered solution in water from powdered Tablets, equivalent to 100 mg/mL of magnesium gluconate
Acceptance criteria: Meet the requirements
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**
Standard solution: 10 mg/mL of USP Potassium Gluconate RS
Sample solution: Equivalent to 10 mg/mL of magnesium gluconate from a dilution of the *Sample solution* obtained for the *Identification test A*
Chromatographic system
(See *Chromatography (621)*, *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel
Application volume: 5 μ L
Developing solvent system: Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)
Spray reagent: Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.
Analysis
Samples: *Standard solution* and *Sample solution*
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for about 10 min.
Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_f value to that of the *Standard solution*.

ASSAY

• PROCEDURE

Sample: A portion of the powder from NLT 20 finely powdered Tablets, equivalent to 800 mg of magnesium gluconate
Blank: Proceed as directed in the *Analysis* without the *Sample*.
Titrimetric system
(See *Titrimetry (541)*.)
Mode: Direct titration
Titrant: 0.05 M edetate disodium VS
Endpoint detection: Visual
Analysis: Transfer the *Sample* to a crucible, and ignite, gently at first, until free from carbon. Cool the crucible, add 25 mL of water and 5 mL of hydrochloric acid, and stir. Heat on a steam bath for 5 min. Filter, rinsing the filter with several portions of water. Dilute the combined filtrate and washings with water to 150 mL. Add ammonia–ammonium chloride buffer TS until the solution is neutral to litmus. Add an excess of 5 mL of am-

monia–ammonium chloride buffer TS and 0.1 mL of eriochrome black TS, and titrate with *Titrant* to a blue endpoint. Perform a *Blank* determination.

Calculate the percentage of the labeled amount of magnesium gluconate ($C_{12}H_{22}MgO_{14}$) in the portion of Tablets taken:

$$\text{Result} = \frac{[(V_S - V_B) \times M \times F/W]}{100} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)
 V_B = *Titrant* volume consumed by the *Blank* (mL)
 M = actual molarity of the *Titrant* (mM/mL)
 F = equivalency factor, 414.6 mg/mM
 W = nominal amount of magnesium gluconate in the *Sample* taken (mg)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: Solution having a known concentration of magnesium in the *Medium*

Sample solution: Filtered portion of the solution under test, suitably diluted with the *Medium* if necessary

Instrumental conditions

(See *Atomic Absorption Spectroscopy (852)*.)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 285.2 nm

Lamp: Magnesium hollow-cathode

Flame: Air–acetylene

Analysis

Samples: *Standard solution* and *Sample solution*
Determine the concentration of magnesium (Mg) in the *Sample solution* in comparison with a *Standard solution*. Calculate the percentage of the labeled amount of magnesium gluconate ($C_{12}H_{22}MgO_{14}$) dissolved:

$$\text{Result} = \frac{(C \times D \times V/L) \times (M_r/A_r)}{100} \times 100$$

C = determined concentration of magnesium in the *Sample solution* (mg/mL)

D = dilution factor for the *Sample solution*

V = volume of *Medium*, 900 mL

L = label amount of magnesium gluconate (mg/Tablet)

M_r = molecular weight of magnesium gluconate, 414.60

A_r = atomic weight of magnesium, 24.31

Tolerances: NLT 80.0% (Q) of the labeled amount of magnesium gluconate ($C_{12}H_{22}MgO_{14}$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Potassium Gluconate RS

Magnesium Hydroxide

$Mg(OH)_2$ 58.32

Magnesium hydroxide.

Magnesium hydroxide [1309-42-8].

» Magnesium Hydroxide, dried at 105° for 2 hours, contains not less than 95.0 percent and not more than 100.5 percent of $Mg(OH)_2$.

Packaging and storage—Preserve in tight containers.

Identification—A 1 in 20 solution in 3 N hydrochloric acid responds to the tests for *Magnesium* (191).

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the test for absence of *Escherichia coli*.

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.

Loss on ignition (733)—Ignite it at 800°, increasing the heat gradually, to constant weight: it loses between 30.0% and 33.0% of its weight.

Soluble salts—Boil 2.0 g with 100 mL of water for 5 minutes in a covered beaker, filter while hot, cool, and dilute the filtrate with water to 100 mL. Titrate 50 mL of the diluted filtrate with 0.10 N sulfuric acid, using methyl red TS as the indicator: not more than 2.0 mL of the acid is consumed. Evaporate 25 mL of the diluted filtrate to dryness, and dry at 105° for 3 hours: not more than 10 mg of residue remains.

Carbonate—Boil a mixture of 0.10 g with 5 mL of water, cool, and add 5 mL of 6 N acetic acid: not more than a slight effervescence is observed.

Limit of calcium—

Dilute hydrochloric acid, Lanthanum solution, Standard preparations, and Blank solution—Prepare as directed in the test for Limit of calcium under *Magnesium Carbonate*.

Test preparation—Transfer 250 mg of Magnesium Hydroxide, previously dried, to a beaker, add 30 mL of Dilute hydrochloric acid, and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of Lanthanum solution, dilute with water to volume, and mix.

Procedure—Proceed as directed in the test for Limit of calcium under *Magnesium Carbonate*: the limit is 1.5%.

Delete the following:

***Heavy metals, Method 1** (231)—Dissolve 1.0 g in 15 mL of 3 N hydrochloric acid, and evaporate the solution on a steam bath to dryness. Toward the end of the evaporation, stir the residue frequently, disintegrate it so that finally a dry powder is obtained, dissolve the residue in 20 mL of water, and filter. To the filtrate, which should be neutral to litmus, add 2 mL of 1 N acetic acid, and dilute with water to 25 mL: the limit is 20 µg per g. (Official 1-Jan-2018)

Limit of lead—[NOTE—When water is specified as a diluent, use deionized ultra-filtered water.]

Blank solution—Transfer 3.0 mL of nitric acid to a 50-mL volumetric flask, and dilute with water to volume.

Thallium internal standard 20 ppb—[NOTE—Use this solution only if an ICP-MS instrument is used. This internal standard is added in-line via a mixing block between the sample probe and the spray chamber.] Dilute 20.0 mL of a commercially prepared thallium ICP standard solution (1000 ppb) with water to 1 L.

Dilute nitric acid—Dilute 2.0 mL of nitric acid with water to 100 mL.

Standard stock solution 100 ppb—Prepare this solution fresh every two months. Quantitatively dilute an accurately measured volume of a commercially prepared lead ICP standard (1000 ppm) with Dilute nitric acid to obtain a solution containing 10 ppm of lead. Further dilute this solution with Dilute nitric acid to obtain a solution containing 1000 ppb of lead. Transfer 10.0 mL of this solution to a separate 100-mL volumetric flask, add 2.0 mL of nitric acid, and dilute with water to volume.

Standard solutions—Prepare these solutions fresh weekly. [NOTE—The concentrations specified below are recommended if an ICP-MS instrument is used. If an ICP-AES instrument is used, the concentrations of the Standard solu-

tions may be modified to adapt to the working range of the instrument.] Transfer 5.0 mL of the Standard stock solution 100 ppb to a 50-mL volumetric flask, add 3.0 mL of nitric acid, and dilute with water to volume (Standard lead solution 10 ppb). Transfer 5.0 mL of Standard lead solution 10 ppb to a 50-mL volumetric flask, add 3.0 mL of nitric acid, and dilute with water to volume (Standard lead solution 1 ppb).

Test solution—[NOTE—The concentration specified below is recommended if an ICP-MS instrument is used. If an ICP-AES instrument is used, the concentration of the Test solution may be modified to adapt to the working range of the instrument.]

Accurately weigh about 0.25 g of Magnesium Hydroxide. Cautiously add 3.0 mL of nitric acid, and mix until the sample is dissolved. Accurately transfer this solution to a 50-mL volumetric flask, and dilute with water to volume.

Procedure (see *Plasma Spectrochemistry* (730))—The inductively coupled plasma-mass spectrometer (ICP-MS) is equipped with a quadrupole mass spectrometer and an ion detector maintained under vacuum. The instrument should read all isotopes for lead (206, 207, and 208 amu) and the thallium internal standard (205 amu), and should report the total lead content using the most naturally abundant isotope at 208 amu. Alternatively, lead could be determined using an inductively coupled plasma-atomic emission spectrometer (ICP-AES) by measuring the emission at 220.353 nm, with the settings optimized as directed by the manufacturer. [NOTE—To minimize matrix interference when using an ICP-AES instrument, it is recommended that the method of standard additions be used.]

Instrument performance must be verified to conform to the manufacturer's specifications for resolution and sensitivity. Before analyzing samples, the instrument must pass a suitable performance check. Generate the calibration curve using the Blank solution, Standard lead solution 1 ppb, and Standard lead solution 10 ppb: a linear regression coefficient is not less than 0.999.

Aspirate the Test solution, at least in duplicate, and calculate the amount of lead using the calibration curve. Report the average reading as the lead content of the sample. Calculate the content of lead in the portion of Magnesium Hydroxide taken: not more than 0.00015% (1.5 ppm) is found.

Assay—Transfer about 75 mg of Magnesium Hydroxide, previously dried and accurately weighed, to a conical flask. Add 2 mL of 3 N hydrochloric acid, and swirl to dissolve. Add 100 mL of water, adjust the reaction of the solution to a pH of 7 (using pH indicator paper; see *Indicator and Test Papers* under *Reagents* in the section *Reagents, Indicators, and Solutions*) with 1 N sodium hydroxide, add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of Mg(OH)₂.

Magnesium Hydroxide Paste

» Magnesium Hydroxide Paste is an aqueous paste of Magnesium Hydroxide. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of magnesium hydroxide [Mg(OH)₂], the labeled amount being not less than 28.0 percent and not more than 70.0 percent of magnesium hydroxide.

Packaging and storage—Preserve in tight containers.

Identification—One g of Paste dissolved in 10 mL of 3 N hydrochloric acid responds to the tests for *Magnesium* (191).

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—Its total aerobic microbial count does not exceed 400 cfu per g, and it meets the requirements of the test for absence of *Escherichia coli*.

Change to read:

Soluble alkalies—Accurately weigh a portion of Paste, equivalent to about 7.75 g of magnesium hydroxide, and mix with 75.0 mL of water. Transfer about 25 mL of this diluted Paste to a filter, and reject the first 5 mL of the filtrate. [NOTE—Retain the remaining diluted Paste for the test for *Carbonate and acid-insoluble matter*.] (Official 1-Jan-2018) Dilute 5 mL of the clear filtrate with 40 mL of water. Add 1 drop of methyl red TS, and titrate the solution with 0.10 N sulfuric acid to the production of a persistent pink color: not more than 1.0 mL of the acid is required.

Soluble salts—To 5.0 mL of the clear filtrate obtained in the test for *Soluble alkalies* add 3 drops of sulfuric acid, evaporate on a steam bath to dryness, and ignite gently to constant weight: the residue weighs not more than 12 mg.

Carbonate and acid-insoluble matter—To 1 mL of the diluted Paste obtained in the test for *Soluble alkalies* add 2 mL of 3 N hydrochloric acid: not more than a slight effervescence occurs, and the solution is not more than slightly turbid.

Limit of calcium—

Dilute hydrochloric acid, Lanthanum solution, Standard preparations, and Blank solution—Prepare as directed in the test for *Limit of calcium* under *Magnesium Carbonate*.

Test preparation—Transfer a portion of the Paste, equivalent to 250 mg of $Mg(OH)_2$, to a beaker, add 30 mL of *Dilute hydrochloric acid*, and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of *Lanthanum solution*, dilute with water to volume, and mix.

Procedure—Proceed as directed in the test for *Limit of calcium* under *Magnesium Carbonate*: the limit is 1.5%.

Delete the following:

• **Heavy metals, Method I (231)**—To 4.0 mL of the diluted Paste obtained in the test for *Soluble alkalies* add 6 mL of 3 N hydrochloric acid, and evaporate the solution on a steam bath to dryness, with frequent stirring. Dissolve the residue in 20 mL of water, and evaporate to dryness in the same manner as before. Redissolve in 20 mL of water, filter if necessary, and dilute with water to 25 mL: the limit is 5 ppm, based on the amount of diluted Paste taken. (Official 1-Jan-2018)

Limit of lead—

Blank solution, Thallium internal standard 20 ppb, Dilute nitric acid, Standard stock solution 100 ppb, and Standard solutions—Proceed as directed in the test for *Limit of lead* under *Magnesium Hydroxide*.

Test solution—Accurately weigh an amount of Paste equivalent to 0.25 g of magnesium hydroxide. Cautiously add 3.0 mL of nitric acid, and mix until the sample is dissolved. Accurately transfer this solution to a 50-mL volumetric flask, and dilute with water to volume. [NOTE—This concentration is recommended if an ICP-MS instrument is used. If an ICP-AES instrument is used, the concentration of the *Test solution* may be modified to adapt to the working range of the instrument.]

Procedure—Proceed as directed in the test for *Limit of lead* under *Magnesium Hydroxide*. Calculate the content of lead in the portion of Paste taken based on the content of magnesium hydroxide in the Paste, as determined in the *Assay*: not more than 0.00015% (1.5 ppm) is found.

Assay—Transfer an accurately weighed portion of Paste, equivalent to about 250 mg of magnesium hydroxide, to a 100-mL volumetric flask. Dissolve in 10 mL of 3 N hydrochloric acid, dilute with water to volume, and mix. Filter, if necessary, and transfer 25.0 mL of the filtrate to a beaker containing 75 mL of water, and mix. Adjust the reaction of the solution to a pH of 7 (using pH indicator paper; see *Indicator and Test Papers* under *Reagents* in the section *Reagents, Indicators, and Solutions*) with 1 N sodium hydroxide, add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 2.916 mg of magnesium hydroxide [$Mg(OH)_2$].

Magnesium Oxide

MgO 40.30
Magnesium oxide [1309-48-4].

DEFINITION

Magnesium Oxide, after ignition, contains NLT 96.0% and NMT 100.5% of magnesium oxide (MgO).

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191):** A solution in diluted hydrochloric acid meets the requirements.

ASSAY

• PROCEDURE

Diluted ammonium hydroxide: Dilute 67 g of ammonium hydroxide (about 75 mL) with water to 100 mL.

Buffer: Prepare ammonium chloride buffer pH 10 as follows. In a 100-mL volumetric flask, dissolve 5.4 g of ammonium chloride in 20 mL of water, add 35 mL of *Diluted ammonium hydroxide*, and dilute with water to volume.

Sample stock solution: Ignite a sample of Magnesium Oxide to a constant weight in the temperature range of $(800^{\circ}\text{--}900^{\circ}) \pm 25^{\circ}$. Weigh 320 mg of the ignited sample into a 100-mL volumetric flask, dissolve in 20 mL of 2 N hydrochloric acid, and dilute with water to volume.

Sample solution: Transfer 20.0 mL of the *Sample stock solution* to a 500-mL flask, and dilute with water to 300 mL. The *Sample solution* is equivalent to 64 mg of ignited Magnesium Oxide.

Analysis: To the *Sample solution*, add 10 mL of *Buffer* and 50 mg of eriochrome black T-sodium chloride indicator. Heat the sample to 40° , and titrate to a blue endpoint with 0.1 M edetate disodium VS. Perform a blank determination, and make any necessary correction to determine the volume of 0.1 M edetate disodium consumed (V_s).

Calculate the volume of 0.1 M edetate disodium, V_{Ca} , in mL, consumed by calcium, which is present in the portion of Magnesium Oxide taken:

$$V_{Ca} = (W \times L_{Ca}) / (F_{Ca} \times 100)$$

W = amount of ignited Magnesium Oxide in the *Sample solution* (mg)

L_{Ca} = content of calcium as determined in the test for *Limit of Calcium* (%)

F_{Ca} = weight of calcium equivalent to each mL of 0.1 M edetate disodium, 4.008 mg

Calculate the percentage of magnesium oxide (MgO) in the portion of Magnesium Oxide taken:

$$\text{Result} = (V_s - V_{Ca}) \times (F_{MgO}/W) \times 100$$

V_s = volume of 0.1 M edetate disodium consumed by the *Sample solution* (mL)

- V_{Ca} = volume of 0.1 M edetate disodium consumed by calcium (mL)
 F_{MgO} = weight of Magnesium Oxide equivalent to each mL of 0.1 M edetate disodium, 4.030 mg
 W = amount of the ignited Magnesium Oxide in the *Sample solution* (mg)
Acceptance criteria: 96.0%–100.5% after ignition

IMPURITIES• **FREE ALKALI AND SOLUBLE SALTS**

Sample solution: Boil 2.0 g with 100 mL of water for 5 min in a covered beaker, and filter while hot. Allow to cool, and dilute with water to 100 mL.

Analysis 1: To 50 mL of the *Sample solution* add methyl red TS, and titrate with 0.10 N sulfuric acid.

Acceptance criteria 1: NMT 2.0 mL of the acid is consumed.

Analysis 2: Evaporate 25 mL of the remaining *Sample solution* to dryness, and dry at 105° for 1 h.

Acceptance criteria 2: NMT 10 mg of residue remains (NMT 2.0%).

• **ACID-INSOLUBLE SUBSTANCES**

Sample: 2 g

Analysis: Mix the *Sample* with 75 mL of water, add hydrochloric acid in small portions with agitation until no more dissolves, and boil for 5 min. If an insoluble residue remains, filter, wash well with water until the last washing is free from chloride, and ignite.

Acceptance criteria: The weight of the ignited residue is NMT 2 mg (NMT 0.1%).

• **LIMIT OF CALCIUM**

[NOTE—A commercially available atomic absorption standard solution for calcium may be used where preparation of a calcium standard stock solution is described below. Concentrations of the *Standard solutions* and the *Sample solution* may be modified to fit the linear or working range of the instrument.]

Dilute hydrochloric acid: Dilute 100 mL of hydrochloric acid with water to 1000 mL.

Lanthanum solution: To 58.65 g of lanthanum oxide, add 400 mL of water, and add, gradually with stirring, 250 mL of hydrochloric acid. Stir until dissolved, and dilute with water to 1000 mL.

Standard solutions: Transfer 249.7 mg of calcium carbonate, previously dried at 300° for 3 h and cooled in a desiccator for 2 h, to a 100-mL volumetric flask. Dissolve in a minimum amount of hydrochloric acid, and dilute with water to volume. Transfer 1.0, 5.0, 10.0, and 15.0 mL of this stock solution to separate 1000-mL volumetric flasks, each containing 20 mL of the *Lanthanum solution* and 40 mL of *Dilute hydrochloric acid*, and dilute with water to volume. These *Standard solutions* contain 1.0, 5.0, 10.0, and 15.0 µg/mL of calcium, respectively.

Sample solution: Transfer 250 mg of Magnesium Oxide, freshly ignited for 1 h in the temperature range of (800°–900°) ± 25°, to a beaker. Add 30 mL of *Dilute hydrochloric acid*, and stir until dissolved, heating if necessary. Transfer the solution so obtained to a 200-mL volumetric flask containing 4 mL of *Lanthanum solution*, and dilute with water to volume.

Blank solution: Transfer 4 mL of the *Lanthanum solution* and 10 mL of *Dilute hydrochloric acid* to a 200-mL volumetric flask, and dilute with water to volume.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: Calcium emission line at 422.7 nm

Lamp: Calcium hollow-cathode

Flame: Nitrous oxide–acetylene

Analysis

Samples: *Standard solutions*, *Sample solution*, and *Blank solution*

Using the calibration graph, determine the concentration, C , in µg/mL, of calcium in the *Sample solution*. Calculate the percentage of calcium in the portion of Magnesium Oxide taken:

$$\text{Result} = [(V/W) \times C \times F] \times 100$$

V = volume of the *Sample solution* (mL)

W = weight of Magnesium Oxide (mg)

C = concentration of calcium in the *Sample solution* (µg/mL)

F = conversion from µg/mL to mg/mL, 0.001

Acceptance criteria: NMT 1.1%

Delete the following:• **HEAVY METALS (231)**

Test preparation: Dissolve 2.0 g in 35 mL of 3 N hydrochloric acid, and evaporate the solution on a steam bath to dryness. Toward the end of the evaporation, stir frequently to disintegrate the residue so that finally a dry powder is obtained. Dissolve the residue in 20 mL of water, and evaporate to dryness in the same manner as before. Redissolve the residue in 20 mL of water, filter if necessary, and dilute with water to 40 mL. To 20 mL, add water to make 25 mL.

Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

• **IRON (241)**

Test preparation: Boil 40 mg with 5 mL of 2 N nitric acid for 1 min. Cool, dilute with water to 50 mL, and mix. Dilute 25 mL of this solution with water to 45 mL, and add 2 mL of hydrochloric acid.

Acceptance criteria: NMT 0.05%

SPECIFIC TESTS• **LOSS ON IGNITION (733)**

Sample: 500–1000 mg

Analysis: Transfer the *Sample* to a tared platinum crucible, and ignite in the temperature range of (800°–900°) ± 25° to constant weight.

Acceptance criteria: NMT 10.0%

• **BULK DENSITY AND TAPPED DENSITY OF POWDERS, Bulk Density, Method I (616):** Using the procedure specified in the chapter, determine the bulk density of Magnesium Oxide.**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **LABELING:** Label it to indicate its bulk density. The indicated density may be in the form of a range.

Magnesium Oxide Capsules**DEFINITION**

Magnesium Oxide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of magnesium oxide (MgO).

IDENTIFICATION• **A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**

Sample solution: Transfer the contents of 1 Capsule to a beaker. Add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 min, and filter. Use the filtrate.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Eriochrome black indicator solution: Dissolve 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol.

Sample solution: Mix the contents of NLT 20 Capsules. Transfer a portion of the powder, equivalent to 500 mg of magnesium oxide, to a beaker. Add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume.

Analysis: Transfer 20.0 mL of the *Sample solution* to a 400-mL beaker. Add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of *Eriochrome black indicator solution*. Cool the solution to 3°–4° by immersion of the beaker in an ice bath. Remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the *Sample solution*, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.05 M edetate disodium consumed is equivalent to 2.015 mg of MgO.

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Analysis: Using atomic absorption spectrophotometry at a wavelength of 285.2 nm, determine the amount of MgO dissolved, using filtered portions of the solution under test, suitably diluted with *Medium* if necessary, in comparison with a standard solution having a known concentration of magnesium in the same *Medium*.

Tolerances: NLT 75% (Q) of the labeled amount of MgO is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

SPECIFIC TESTS

• ACID-NEUTRALIZING CAPACITY (301):

NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT 85.0% of the expected mEq value calculated from the results of the Assay is obtained. Each mg of MgO has an expected acid-neutralizing capacity value of 0.0492 mEq.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

Magnesium Oxide Tablets

DEFINITION

Magnesium Oxide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of magnesium oxide (MgO).

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

Sample solution: Finely powder 1 Tablet. Transfer the powder to a beaker, add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, and heat to boiling. Add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 min, and filter. Use the filtrate.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Eriochrome black indicator solution: Dissolve 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol.

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 500 mg of magnesium oxide, to a beaker. Add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume.

Analysis: Transfer 20.0 mL of the *Sample solution* to a 400-mL beaker. Add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia–ammonium chloride buffer TS and 3 drops of *Eriochrome black indicator solution*. Cool the solution to 3°–4° by immersion of the beaker in an ice bath. Remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the *Sample solution*, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.05 M edetate disodium consumed is equivalent to 2.015 mg of MgO.

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 75 rpm

Time: 45 min

Analysis: Using atomic absorption spectrophotometry at a wavelength of 285.2 nm, determine the amount of MgO dissolved, using filtered portions of the solution under test, suitably diluted with *Medium* if necessary, in comparison with a standard solution having a known concentration of magnesium in the same *Medium*.

Tolerances: NLT 75% (Q) of the labeled amount of MgO is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

SPECIFIC TESTS

• ACID-NEUTRALIZING CAPACITY (301)

(where Tablets are labeled as intended for antacid use): NLT 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and NLT 85.0% of the expected mEq value calculated from the results of the Assay is obtained. Each mg of MgO has an expected acid-neutralizing capacity value of 0.0492 mEq.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

Magnesium Phosphate

$\text{Mg}_3(\text{PO}_4)_2 \cdot 5\text{H}_2\text{O}$ 352.93
Phosphoric acid, magnesium salt (2:3), pentahydrate;
Magnesium phosphate (3:2) pentahydrate [10233-87-1].
 $\text{Mg}_3(\text{PO}_4)_2$ 262.86
[7757-87-1].

DEFINITION

Magnesium Phosphate, ignited at 425° to constant weight, contains NLT 98.0% and NMT 101.5% of $\text{Mg}_3(\text{PO}_4)_2$.

IDENTIFICATION

- **A.**
Sample: 200 mg
Analysis: Dissolve the *Sample* in 10 mL of 2 N nitric acid, and add, dropwise, ammonium molybdate TS.
Acceptance criteria: A greenish-yellow precipitate of ammonium phosphomolybdate is formed, and it is soluble in 6 N ammonium hydroxide.
- **B. IDENTIFICATION TESTS—GENERAL, Magnesium (191)**
Sample solution: Dissolve 0.1 g in 0.7 mL of 1 N acetic acid and 20 mL of water. Add 1 mL of ferric chloride TS, allow to stand for 5 min, and filter. Use 5 mL of the filtrate.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Sample: 200 mg, previously ignited at 425° to constant weight
Analysis: Dissolve the *Sample* in a mixture of 25 mL of water and 10 mL of 2 N nitric acid. Filter, if necessary. Wash any precipitate, add sufficient 6 N ammonium hydroxide to the filtrate to produce a slight precipitate, and then dissolve the precipitate by the addition of 1 mL of 2 N nitric acid. Adjust the temperature to 50°, add 75 mL of ammonium molybdate TS, and maintain the temperature at 50° for 30 min, stirring occasionally. Wash the precipitate once or twice with water by decantation, using 30–40 mL each time and passing the washings through a filter. Transfer the precipitate to the filter, and wash with potassium nitrate solution (1 in 100) until the last washing is not acid to litmus. Transfer the precipitate and filter to the precipitation vessel. Add 50 mL of water and 40.0 mL of 1 N sodium hydroxide VS, and agitate until the precipitate is dissolved. Add phenolphthalein TS, and then titrate the excess alkali with 1 N sulfuric acid VS. Each mL of 1 N sodium hydroxide is equivalent to 5.716 mg of $Mg_3(PO_4)_2$.
Acceptance criteria: 98.0%–101.5% on the previously ignited basis

IMPURITIES

- **ACID-INSOLUBLE SUBSTANCES**
[NOTE—Perform if an insoluble residue remains in the test for *Carbonate*.]
Analysis: Filter the solution, wash well with hot water until the last washing is free from chloride, and ignite the residue.
Acceptance criteria: The weight of the residue does not exceed 4 mg (NMT 0.2%).
- **SOLUBLE SUBSTANCES**
Sample: 2.0 g
Analysis: Digest the *Sample* with 100 mL of water on a steam bath for 30 min. Cool, add sufficient water to restore the original volume, mix, and filter. Evaporate 50 mL of the filtrate to dryness, and ignite gently to constant weight.
Acceptance criteria: The weight of the residue does not exceed 15 mg (NMT 1.5%).
- **CARBONATE**
Sample: 2.0 g
Analysis: Mix the *Sample* with 20 mL of water, and add hydrochloric acid, dropwise, to dissolve.
Acceptance criteria: No effervescence occurs when the acid is added.
- **CHLORIDE AND SULFATE, Chloride (221)**
Sample: 0.50 g
Analysis: Dissolve the *Sample* in 50 mL of 2 N nitric acid, and add 1 mL of silver nitrate TS.
Acceptance criteria: The turbidity does not exceed that produced by 1.0 mL of 0.020 N hydrochloric acid (NMT 0.14%).

- **CHLORIDE AND SULFATE, Sulfate (221)**
Sample: 0.50 g
Analysis: Dissolve the *Sample* in the smallest possible amount of 3 N hydrochloric acid, dilute with water to 48 mL, and add 2 mL of barium chloride TS.
Acceptance criteria: The turbidity does not exceed that produced by 3.0 mL of 0.020 N sulfuric acid (NMT 0.6%).
- **LIMIT OF NITRATE**
Sample: 0.20 g
Analysis: Mix the *Sample* with 5 mL of water, and add just sufficient hydrochloric acid to dissolve. Dilute with water to 10 mL, add 0.1 mL of indigo carmine TS, then add, with stirring, 10 mL of sulfuric acid.
Acceptance criteria: The blue color persists for NLT 5 min.
- **ARSENIC, Method I (211)**
Test preparation: Prepare as directed in the chapter, using 1.0 g and dissolving it first in just a sufficient amount of 3 N hydrochloric acid (about 9 mL).
Acceptance criteria: NMT 3 ppm
- **BARIUM**
Sample: 2.0 g
Analysis: Mix the *Sample* with 40 mL of water. Heat, add hydrochloric acid, dropwise, to dissolve, and then add 1 mL of acid in excess. Cool, dilute with water to 50 mL, and filter. To 5 mL of the filtrate add 1 mL of potassium sulfate TS.
Acceptance criteria: No turbidity is produced within 15 min.
- **CALCIUM**
Sample: 0.50 g
Analysis: Mix the *Sample* with 15 mL of water. Heat, and add sufficient hydrochloric acid, in small portions, to dissolve. Cool, add 6 N ammonium hydroxide, in small portions, to produce a slight permanent precipitate, then add 2 mL of 6 N acetic acid. Dilute with water to 25 mL, and filter. To 10 mL of the filtrate add 2 mL of ammonium oxalate TS.
Acceptance criteria: NMT a slight turbidity is produced within 5 min.
- **DIBASIC SALT AND MAGNESIUM OXIDE**
Sample: Ignite about 2.5 g to constant weight and use 2 g of the ignited salt.
Analysis: Dissolve the *Sample* by warming with 50.0 mL of 1 N hydrochloric acid VS. Cool, add 1 or 2 drops of methyl orange TS, and slowly titrate the excess 1 N hydrochloric acid VS with 1 N sodium hydroxide VS to a yellow color, vigorously shaking the mixture during the titration.
Acceptance criteria: 14.8–15.4 mL of 1 N hydrochloric acid is consumed for each g of the ignited salt.
- **LEAD (251)**
Test preparation: Dissolve 1.0 g in 20 mL of 3 N hydrochloric acid, evaporate on a steam bath to 10 mL, dilute with water to 20 mL, and cool.
Analysis: Proceed as directed in the chapter, using 5 mL of *Diluted Standard Lead Solution* (5 µg of Pb).
Acceptance criteria: NMT 5 ppm

Delete the following:

- **HEAVY METALS, Method I (231)**
Test preparation: Dissolve 0.67 g in 4.5 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.
Acceptance criteria: NMT 30 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):** It meets the requirements of the test for the absence of *Escherichia coli*.
- **LOSS ON IGNITION (733):** Ignite a sample at 425° to constant weight; it loses 20.0%–27.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Magnesium Salicylate

$C_{14}H_{10}MgO_6 \cdot 4H_2O$ 370.59

$C_{14}H_{10}MgO_6$ 298.54

Magnesium, bis(2-hydroxybenzoato- O^1, O^2)-, tetrahydrate;
Magnesium salicylate (1:2), tetrahydrate [18917-95-8].
Anhydrous [18917-89-0].

DEFINITION

Magnesium Salicylate contains NLT 98.0% and NMT 103.0% of magnesium salicylate ($C_{14}H_{10}MgO_6 \cdot 4H_2O$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Magnesium (191):** Meets the requirements

ASSAY**• PROCEDURE**

Mobile phase: Methanol, phosphoric acid, and water (40: 0.1: 60), prepared by adding 1 mL of phosphoric acid to a solution containing 400 mL of methanol and 600 mL of water

Magnesium Salicylate Tablets

DEFINITION

Magnesium Salicylate Tablets contain an amount of magnesium salicylate ($C_{14}H_{10}MgO_6 \cdot 4H_2O$) equivalent to NLT 95.0% and NMT 105.0% of the labeled amount of anhydrous magnesium salicylate ($C_{14}H_{10}MgO_6$).

IDENTIFICATION

A. The IR absorption spectrum of a potassium bromide dispersion of a quantity of finely powdered Tablets exhibits maxima at the same wavelengths as those of a similar preparation of USP Magnesium Salicylate RS.

B. IDENTIFICATION TESTS—GENERAL, Magnesium (191)

Sample solution: Prepare a 50-mg/mL magnesium salicylate solution from Tablets, and filter.

Acceptance criteria: Meet the requirements

C. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Methanol, trifluoroacetic acid, and water (40:0.1:60), prepared by adding 1 mL of trifluoroacetic acid to a solution containing 400 mL of methanol and 600 mL of water

Standard solution: 0.05 mg/mL of anhydrous USP

Magnesium Salicylate RS in *Mobile phase*

Sample stock solution: Nominally 0.5 mg/mL of anhydrous magnesium salicylate from NLT 20 finely powdered Tablets in *Mobile phase* prepared as follows.

Transfer a suitable amount of the powder to a suitable volumetric flask. Add 75% of the flask volume of *Mobile phase*, and sonicate for 10 min. Allow the solution to cool to room temperature and then dilute with *Mobile phase* to volume.

Sample solution: Nominally 0.05 mg/mL of anhydrous magnesium salicylate in *Mobile phase*, from the *Sample stock solution*. Pass through a suitable filter of 0.20- μ m pore size, discarding the first 2–3 mL of the filtrate.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 212 nm

Column: 2.1-mm \times 5-cm; 1.7- μ m packing L1

Column temperature: 30°

Flow rate: 0.2 mL/min

Injection volume: 2 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: 0.8–1.8

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of anhydrous magnesium salicylate ($C_{14}H_{10}MgO_6$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of anhydrous USP Magnesium Salicylate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of anhydrous magnesium salicylate in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 120 min

Standard solution: USP Salicylic Acid RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter, and dilute with *Medium* if necessary.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum wavelength at about 296 nm

Blank: Water

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of anhydrous magnesium salicylate ($C_{14}H_{10}MgO_6$) dissolved:

$$\text{Result} = (A_U/A_S) \times (1/L) \times (M_1/M_2) \times C_S \times V \times 100$$

A_U = absorbance from the *Sample solution*

A_S = absorbance from the *Standard solution*

L = nominal concentration of anhydrous magnesium salicylate in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of anhydrous magnesium salicylate, 298.54

M_{r2} = twice the molecular weight of salicylic acid, 276.24

C_s = concentration of USP Salicylic Acid RS in the *Standard solution* (mg/mL)

V = volume of *Medium*, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of anhydrous magnesium salicylate ($C_{14}H_{10}MgO_6$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase: Methanol, trifluoroacetic acid, and water (40: 0.1: 60), prepared by adding 1 mL of trifluoroacetic acid to a solution containing 400 mL of methanol and 600 mL of water

System suitability solution: 0.5 mg/mL of USP Magnesium Salicylate RS, 0.5 µg/mL of USP Salicylic Acid Related Compound A RS, 0.5 µg/mL of USP Salicylic Acid Related Compound B RS, and 0.5 µg/mL of USP Phenol RS, in *Mobile phase*

Standard solution: 2.5 µg/mL of anhydrous USP Magnesium Salicylate RS in *Mobile phase*

Sample solution: Nominally 2.5 mg/mL of anhydrous magnesium salicylate from NLT 20 finely powdered Tablets in *Mobile phase* prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 80% of the flask volume of *Mobile phase*, and sonicate for 15 min. Allow the solution to cool to room temperature and then dilute with *Mobile phase* to volume. Centrifuge the solution, and use the supernatant.

Magnesium Sulfate

$MgSO_4 \cdot xH_2O$

Sulfuric acid magnesium salt (1:1), hydrate;

Magnesium sulfate (1:1) monohydrate 138.36
[14168-73-1].

Magnesium sulfate (1:1) heptahydrate 246.47
[10034-99-8].

Anhydrous 120.37
[7487-88-9].

DEFINITION

Magnesium Sulfate, rendered anhydrous by ignition, contains NLT 99.0% and NMT 100.5% of $MgSO_4$.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL,** *Magnesium (191)* and *Sulfate (191)*

Sample solution: 50 mg/mL

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 250 mg of the ignited Magnesium Sulfate obtained in the test for *Loss on Ignition*

Titrimetric system

Mode: Direct titration

Titrant: 0.05M edetate sodium VS

Endpoint detection: Colorimetric

Analysis: Dissolve the *Sample* in 100 mL of water and the minimum amount of 3 N hydrochloric acid required for a clear solution. Adjust the reaction of the solution (using pH indicator paper; see *Reagents, Indicators, and Solutions—Reagents—Indicator and Test Papers*) with 1 N sodium hydroxide to a pH of 7, add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS, and titrate with the *Titrant* to a

blue endpoint. Calculate the percentage of MgSO_4 in the portion of the ignited Magnesium Sulfate taken:

$$\text{Result} = [V \times N \times F \times 100] / W$$

- V = Sample titrant volume (mL)
 N = titrant molarity (mmol/mL)
 F = equivalency factor, 120.36 mg/mmol
 W = weight of Sample (mg)

Acceptance criteria: 99.0%–100.5% on the anhydrous by ignition basis

IMPURITIES

• LIMIT OF CHLORIDE (221)

Sample: 1.0 g

Acceptance criteria: The Sample shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.014%).

• LIMIT OF IRON (241)

Magnesium Sulfate intended for use in preparing nonparenteral dosage forms

Sample solution: Dissolve 0.50 g in 40 mL of water.

Analysis: Proceed as directed in the test for Iron (241).

Acceptance criteria: NMT 20 µg/g

Magnesium Sulfate intended for use in preparing parenteral dosage forms

[NOTE—Rinse all glassware used in this test with Dilute hydrochloric acid.]

Dilute hydrochloric acid: 1 mL of hydrochloric acid diluted with water to 1000 mL

Solution A: 500 mg/mL of ammonium acetate in water

Solution B: 13.4 mg/mL of ascorbic acid in water.

[NOTE—Use this solution on the day prepared.]

Color reagent: 3.8 mg/mL of 3-(2-pyridyl)-5,6-di-(2-furyl)-1,2,4-triazine-5',5''-disulfonic acid, disodium salt in Solution A. Shake by mechanical means if necessary. Use this solution on the day prepared.

Standard stock solution: 1.0 µg/mL of iron, from Standard Iron Solution in Dilute hydrochloric acid

Standard solutions: To three separate 50-mL volumetric flasks transfer 2.0, 5.0, and 10.0 mL of Standard stock solution, and dilute each with Dilute hydrochloric acid to 35 mL. These solutions contain 2.0, 5.0, and 10.0 µg of iron, respectively.

Sample solution: Transfer 10.0 g of Magnesium Sulfate to a 50-mL volumetric flask, add Dilute hydrochloric acid to 35 mL, and sonicate, if necessary, to dissolve.

Blank: Transfer 35 mL of Dilute hydrochloric acid to a 50-mL volumetric flask.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV-Vis

Analytical wavelength: 594 nm

Analysis

Samples: Standard solutions, Blank, and Sample solution

To each of the flasks containing the Standard solutions, the Sample solution, and the Blank add 5 mL of Solution B and 5 mL of Color reagent. Dilute each solution with Dilute hydrochloric acid to volume, mix, and allow to stand for 10 min.

Plot the absorbance values of the Standard solutions versus their iron contents in µg and draw the straight line best fitting the three plotted points. From the graph, determine the iron content, C , in µg, of the Sample solution.

Calculate the content, in µg/g, of iron in the portion of Magnesium Sulfate taken:

$$\text{Result} = C / W$$

C = content of iron in the Sample solution in µg, determined from the graph

W = weight of Magnesium Sulfate in the Sample solution (g)

Acceptance criteria: NMT 0.5 µg/g

• SELENIUM (291)

Test solution: 200 mg in 50 mL of 0.25 N nitric acid

Acceptance criteria: NMT 30 µg/g

Delete the following:

• HEAVY METALS (231)

Sample solution: 2 g in 25 mL of water

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

• PH (791)

Sample solution: 50 mg/mL

Acceptance criteria: 5.0–9.2

• LOSS ON DRYING (731):

Dry a sample at 105° for 2 h; the anhydrous form loses NMT 2% of its weight.

• LOSS ON IGNITION (733)

Sample: 1 g

Analysis: Weigh the Sample in a crucible, heat at 105° for 2 h, then ignite in a muffle furnace at 450 ± 25° to constant weight.

Acceptance criteria

Monohydrate: Loses 13.0%–16.0% of its weight

Dried form: Loses 22.0%–28.0% of its weight

Heptahydrate: Loses 40.0%–52.0% of its weight

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

• LABELING:

The label states whether it is the monohydrate, the dried form, or the heptahydrate. Magnesium Sulfate intended for use in preparing parenteral dosage forms is so labeled. Magnesium Sulfate not intended for use in preparing parenteral dosage forms is so labeled. In addition, it may be labeled also as intended for use in preparing nonparenteral dosage forms.

Magnesium Sulfate Injection

DEFINITION

Magnesium Sulfate Injection is a sterile solution of Magnesium Sulfate in Water for Injection. It contains magnesium sulfate (MgSO_4) equivalent to NLT 93.0% and NMT 107.0% of the labeled amount of magnesium sulfate heptahydrate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$).

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Magnesium (191) and Sulfate (191):

Meets the requirements

ASSAY

• PROCEDURE

Sample: A known volume of Injection equivalent to 250 mg of anhydrous magnesium sulfate

Titrimetric system

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis

Sample: Sample

Transfer the Sample to a beaker, and dilute with water to 100 mL. Adjust with 1 N sodium hydroxide to a pH of 7 (using pH indicator paper; see Reagents, Indicators, and Solutions—Indicators and Indicator Test Papers). Add 5 mL of ammonia–ammonium chloride buffer TS and 0.15 mL of eriochrome black TS. Titrate with Titrant to a blue endpoint. Each mL of Titrant consumed is equivalent to 12.32 mg of magnesium sulfate heptahydrate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$).

Acceptance criteria: 93.0%–107.0%

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.09 USP Endotoxin Unit/mg of magnesium sulfate.
- **PH (791)**
Sample solution: 50 mg/mL
Acceptance criteria: 5.5–7.0
- **PARTICULATE MATTER IN INJECTIONS (788):** Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products (1)*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
- **LABELING:** The label states the total osmolar concentration in mOsmol/L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol/mL.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS

Magnesium Sulfate in Dextrose Injection

DEFINITION

Magnesium Sulfate in Dextrose Injection is a sterile solution of Magnesium Sulfate and Dextrose in Water for Injection. It contains NLT 93.0% and NMT 107.0% of the labeled amount of magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$) and NLT 90.0% and NMT 110.0% of the labeled amount of dextrose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$).

IDENTIFICATION

- **A.**
Sample solution 1: A suitable volume of Injection equivalent to 50 mg/mL of dextrose
Analysis 1: Add a few drops of the Sample solution to 5 mL of hot alkaline cupric tartrate TS.
Acceptance criteria 1: A copious red precipitate of cuprous oxide is formed.
Analysis 2: Proceed as directed in *Identification Tests—General (191)*, Magnesium.
Acceptance criteria 2: Meets the requirements

ASSAY

- **MAGNESIUM SULFATE**
Sample: A known volume of Injection equivalent to 250 mg of anhydrous magnesium sulfate
Titrimetric system
Mode: Direct titration
Titrant: 0.05 M edetate disodium VS
Endpoint detection: Visual
Analysis: Transfer the Sample to a beaker, and dilute with water to 100 mL. Adjust with 1 N sodium hydroxide to a pH of 7 using pH indicator paper (see *Reagents, Indicators, and Solutions—Indicator and Test Papers*), and add 5 mL of ammonia-ammonium chloride buffer TS and 0.15 mL of eriochrome black TS. Titrate with Titrant to a blue endpoint. Each mL of Titrant is equivalent to 12.32 mg of magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$).
Acceptance criteria: 93.0%–107.0% of the labeled amount of magnesium sulfate ($\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$)
- **DEXTROSE**
Sample solution: Nominally 2 g/100 mL of dextrose prepared as follows. Transfer a suitable volume of Injection to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, and dilute with water to volume.

Analysis: Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation (781)*). Calculate the percentage of the labeled amount of dextrose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$) in the portion of Injection taken:

$$\text{Result} = [(100 \times a)/(l \times \alpha)] \times (1/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- a = observed angular rotation of the Sample solution ($^\circ$)
 l = length of the polarimeter tube, decimeter
 α = midpoint of the specific rotation range for anhydrous dextrose, 52.9°
 C_U = nominal concentration of dextrose in the Sample solution, g/100 mL
 M_{r1} = molecular weight of dextrose monohydrate, 198.17
 M_{r2} = molecular weight of anhydrous dextrose, 180.16

Acceptance criteria: 90.0%–110.0% of the labeled amount of dextrose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$)

IMPURITIES

- **LIMIT OF 5-HYDROXYMETHYLFURFURAL AND RELATED SUBSTANCES**

Sample solution: Nominally 2 mg/mL of dextrose ($\text{C}_6\text{H}_{12}\text{O}_6 \cdot \text{H}_2\text{O}$) in water from a suitable volume of Injection containing 1.0 g of dextrose in water

Instrumental conditions

Mode: UV
 Analytical wavelength: 284 nm
 Cell: 1 cm
 Blank: Water

Analysis

Samples: Sample solution and Blank
 Acceptance criteria: Absorbance of the Sample solution is NMT 0.25.

SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** NMT 0.039 USP Endotoxin Unit/mg of magnesium sulfate
- **PH (791):** 3.5–6.5
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products (1)*.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS

Magnesium Trisilicate

$2\text{MgO} \cdot 3\text{SiO}_2 \cdot x\text{H}_2\text{O}$ (anhydrous) 260.86
 Silicic acid ($\text{H}_4\text{Si}_3\text{O}_8$), magnesium salt (1:2), hydrate.
 Magnesium silicate hydrate ($\text{Mg}_2\text{Si}_3\text{O}_8 \cdot x\text{H}_2\text{O}$)
 [39365-87-2].
 Anhydrous [14987-04-3].

» Magnesium Trisilicate is a compound of Magnesium Oxide and silicon dioxide with varying proportions of water. It contains not less than 20.0 percent of magnesium oxide (MgO) and not less than 45.0 percent of silicon dioxide (SiO_2).

Packaging and storage—Preserve in well-closed containers.

Identification—

A: Mix about 500 mg with 10 mL of 3 N hydrochloric acid, filter, and neutralize the filtrate to litmus paper with

6 N ammonium hydroxide: the neutralized filtrate responds to the tests for *Magnesium* (191).

B: Prepare a bead by fusing a few crystals of sodium ammonium phosphate on a platinum loop in the flame of a Bunsen burner. Place the hot, transparent bead in contact with Magnesium Trisilicate, and again fuse: silica floats about in the bead, producing, upon cooling, an opaque bead with a web-like structure.

Water Determination, Method III (921)—Weigh accurately about 1 g in a tared platinum crucible provided with a cover. Gradually apply heat to the crucible at first, then strongly ignite to constant weight: it loses between 17.0% and 34.0% of its weight.

Soluble salts—Boil 10.0 g with 150 mL of water for 15 minutes. Cool to room temperature, allow the mixture to stand for 15 minutes, filter with the aid of suction, transfer the filtrate to a 200-mL volumetric flask, dilute with water to volume, and mix. Evaporate 50.0 mL of this solution, representing 2.5 g of the Trisilicate, in a tared platinum dish to dryness, and ignite gently to constant weight: the weight of the residue does not exceed 38.0 mg (1.5%).

Chloride (221)—A 20-mL portion of the diluted filtrate prepared in the test for *Soluble salts*, representing 1 g of Magnesium Trisilicate, shows no more chloride than corresponds to 0.75 mL of 0.020 N hydrochloric acid (0.055%).

Sulfate—Treat the residue obtained in the test for *Soluble salts* with 2 mL of hydrofluoric acid, and evaporate on a steam bath to dryness. Mix the residue with water, transfer to a filter, and wash, using approximately 50 mL of water for the complete procedure. Heat the filtrate to boiling, and add 0.1 mL of hydrochloric acid and 5 mL of barium chloride TS. Maintain the mixture near its boiling point for 1 hour, filter, wash the precipitate thoroughly with water, dry, and ignite to constant weight: the weight of the residue does not exceed 30 mg (0.5%).

Free alkali—Add 2 drops of phenolphthalein TS to 20 mL of the diluted filtrate prepared in the test for *Soluble salts*, representing 1 g of the Trisilicate: if a pink color is produced, not more than 1.0 mL of 0.10 N hydrochloric acid is required to discharge it.

Arsenic, Method I (211): 8 ppm.

Delete the following:

• **Heavy metals (231)**—Boil 2.67 g with a mixture of 50 mL of water and 5 mL of hydrochloric acid for 20 minutes, adding water to maintain the volume during the boiling. Add ammonium hydroxide until the mixture is only slightly acid to litmus paper. Filter with the aid of suction, and wash with 15 to 20 mL of water, combining the washing with the original filtrate. Add 2 drops of phenolphthalein TS, then add a slight excess of 6 N ammonium hydroxide. Discharge the pink color with dilute hydrochloric acid (1 in 100), then add 8 mL of dilute hydrochloric acid (1 in 100). Dilute with water to 100 mL, and use 25 mL of the solution for the test: the limit is 0.003%. (Official 1-Jan-2018)

Acid-consuming capacity—Weigh accurately about 200 mg into a glass-stoppered, 125-mL conical flask. Add 30.0 mL of 0.1 N hydrochloric acid VS and 20.0 mL of water. Place the flask in a bath maintained at 37°, and shake the mixture occasionally during a period of 4 hours but leave the mixture undisturbed during the last 15 minutes of the heating period. Cool to room temperature. To 25.0 mL of the supernatant add methyl red TS, and titrate the excess acid with 0.1 N sodium hydroxide VS. One g of Magnesium Trisilicate, calculated on the anhydrous basis, consumes not less than 140 mL and not more than 160 mL of 0.10 N hydrochloric acid.

Assay for magnesium oxide—Weigh accurately about 1.5 g, and transfer to a 250-mL conical flask. Add 50.0 mL of 1 N sulfuric acid VS, and digest on a steam bath for 1 hour. Cool to room temperature, add methyl orange TS,

and titrate the excess acid with 1 N sodium hydroxide VS. Each mL of 1 N sulfuric acid is equivalent to 20.15 mg of MgO.

Assay for silicon dioxide—Transfer about 700 mg of Magnesium Trisilicate, accurately weighed, to a small platinum dish. Add 10 mL of 1 N sulfuric acid, and heat on a steam bath to dryness, leaving the dish uncovered. Treat the residue with 25 mL of water, and digest on a steam bath for 15 minutes. Decant the supernatant through an ashless filter paper, with the aid of suction, and wash the residue, by decantation, three times with hot water, passing the washings through the filter paper. Finally transfer the residue to the filter, and wash thoroughly with hot water. Transfer the filter paper and its contents to the platinum dish previously used. Heat to dryness, incinerate, ignite strongly for 30 minutes, cool, and weigh. Moisten the residue with water, and add 6 mL of hydrofluoric acid and 3 drops of sulfuric acid. Evaporate to dryness, ignite for 5 minutes, cool, and weigh: the loss in weight represents the weight of SiO₂.

Ratio of SiO₂ to MgO—Divide the percentage of SiO₂ obtained in the *Assay for silicon dioxide* by the percentage of MgO obtained in the *Assay for magnesium oxide*: the quotient obtained is between 2.10 and 2.37.

Magnesium Trisilicate Tablets

» Magnesium Trisilicate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of Mg₂Si₃O₈.

Packaging and storage—Preserve in well-closed containers.

Identification—

A: Powder 1 Tablet, add 10 mL of 3 N hydrochloric acid and 5 drops of methyl red TS, heat to boiling, add 6 N ammonium hydroxide until the color of the solution changes to deep yellow, then continue boiling for 2 minutes, and filter: the filtrate so obtained responds to the tests for *Magnesium* (191).

B: Wash the solids on the filter obtained in *Identification* test A with hot ammonium chloride solution (1 in 50), add 10 mL of 3 N hydrochloric acid, and filter. Transfer the filter paper and contents to a small platinum dish, ignite, cool in a desiccator, and weigh. Moisten the residue with water, and add 6 mL of hydrofluoric acid. Evaporate to dryness, ignite for 5 minutes, cool in a desiccator, and weigh: a loss of more than 10% in relation to the weight of the residue from the initial ignition indicates SiO₂.

Disintegration (701): 10 minutes, simulated gastric fluid TS being substituted for water in the test.

Uniformity of dosage units (905): meet the requirements.

Acid-neutralizing capacity (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling.

Assay—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 g of magnesium trisilicate, to a beaker, add 20 mL of water, and slowly add 40 mL of 3 N hydrochloric acid, with mixing. Heat the mixture to boiling, cool, and filter into a 200-mL volumetric flask. Wash the beaker with water, adding the washings to the filter. Add water to volume, and mix. Transfer 20.0 mL of this solution to a 400-mL beaker, add 180 mL of water and 20 mL of triethanolamine, and stir. Add 10 mL of ammonia-ammonium chloride buffer TS and 3 drops of an eriochrome black indicator solution prepared by dissolving 200 mg of eriochrome black T in a mixture of 15 mL of triethanolamine and 5 mL of dehydrated alcohol, and mix. Cool the solution

to between 3° and 4° by immersion of the beaker in an ice bath, then remove, and titrate with 0.05 M edetate disodium VS to a blue endpoint. Perform a blank determination, substituting 20 mL of water for the assay solution, and make any necessary correction. Each mL of 0.05 M edetate disodium consumed is equivalent to 6.521 mg of $\text{Mg}_2\text{Si}_3\text{O}_8$.

Malathion

$\text{C}_{10}\text{H}_{19}\text{O}_6\text{PS}_2$ 330.36
Butanedioic acid, [(dimethoxyphosphinothioyl)-thio]-, diethyl ester, (\pm)-;
Diethyl (\pm)-mercaptosuccinate, S-ester with O,O-dimethyl phosphorodithioate [121-75-5].

DEFINITION

Malathion contains NLT 98.0% and NMT 102.0% of malathion ($\text{C}_{10}\text{H}_{19}\text{O}_6\text{PS}_2$).

IDENTIFICATION

Manganese Chloride

MnCl ₂ · 4H ₂ O	197.91
Manganese chloride (MnCl ₂) tetrahydrate; Manganese (2+) chloride tetrahydrate [13446-34-9].	
Anhydrous	125.84
[7773-01-5].	

DEFINITION

Manganese Chloride contains NLT 98.0% and NMT 101.0% of MnCl₂, calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Yields white, curdy precipitate of silver chloride with silver nitrate TS, which is insoluble in nitric acid. After being washed with water, this precipitate is soluble in a slight excess of 6 N ammonium hydroxide.
- **B. IDENTIFICATION TESTS—GENERAL, Manganese (191):** Meets the requirements

ASSAY

• PROCEDURE

Sample: 425 mg

Analysis: Transfer the *Sample* to a 400-mL beaker, dissolve in 25 mL of water, add 300 mg of ammonium chloride and 0.5 g of hydroxylamine hydrochloride, and swirl to dissolve. Warm slightly on a hot plate, and dilute with water to 100 mL. Add 3 mL of triethanolamine and stir the solution, preferably using a magnetic stirrer. Begin the titration by adding 25 mL of 0.05 M edetate disodium VS, then add 10 mL of ammonia-ammonium chloride buffer TS, and 1 mL of eriochrome black TS. Continue to titrate with 0.05 M edetate disodium VS to

a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 6.292 mg of MnCl_2 .

Acceptance criteria: 98.0%–101.0% of MnCl_2 on the dried basis

IMPURITIES

• CHLORIDE AND SULFATE, Sulfate (221)

Sample: 2.0 g

Acceptance criteria: Shows no more sulfate than corresponds to 0.10 mL of 0.020 N sulfuric acid (0.005%).

• IRON (241)

Sample solution: 2.0 g in 40 mL of water

Acceptance criteria: NMT 5 ppm

• ZINC

Sample solution: Dissolve 1 g in a mixture of 48 mL of water and 2 mL of sulfuric acid.

Analysis: To the *Sample solution*, add, slowly and with constant agitation, 1 mL of potassium ferrocyanide solution (1 in 100).

Acceptance criteria: No turbidity is produced within 5 min.

Delete the following:

• HEAVY METALS, Method I (231)

Sample solution: Dissolve 6.0 g in 30 mL of water.

[NOTE—Use 25 mL of this solution in the *Test Preparation* and use the remaining 5.0 mL in preparing the *Standard Preparation*.]

Acceptance criteria: NMT 5 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

• INSOLUBLE MATTER

Sample solution: Transfer 10 g to a 250-mL beaker, add 150 mL of water, cover the beaker, and heat to boiling.

Analysis: Digest the hot *Sample solution* on a steam bath for 1 h, and pass through a tared filtering crucible of fine pore size. Rinse the beaker with hot water, passing the rinsings through the filter, and finally wash the filter with additional hot water. Dry the filter at 105°.

Acceptance criteria: The residue weighs NMT 0.5 mg (0.005%).

• SUBSTANCES NOT PRECIPITATED BY AMMONIUM SULFIDE

Sample solution: Dissolve 2.0 g in 90 mL of water, add 5 mL of ammonium hydroxide, and warm the solution to 80°. Pass a stream of hydrogen sulfide through the solution for 30 min. Dilute with water to 100 mL, mix, and allow the precipitate to settle. Decant the supernatant through a filter of fine pore size, and transfer 50.0 mL to an evaporating dish that previously has been ignited and tared.

Analysis: Evaporate the filtrate to dryness, cool, add 0.5 mL of sulfuric acid, heat gently to remove the excess acid, and ignite at $800 \pm 25^\circ$ for 15 min.

Acceptance criteria: The weight of the residue is NMT 2.0 mg (NMT 0.2% as sulfate).

• PH (791)

Sample solution: 10 g in 200 mL of carbon dioxide- and ammonia-free water.

Acceptance criteria: 3.5–6.0

• LOSS ON DRYING (731):

Dry a sample at 50° for 2 h, then raise the temperature to 150° for 24 h: it loses 36.0%–38.5% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Manganese Chloride Injection

» Manganese Chloride Injection is a sterile solution of Manganese Chloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of manganese (Mn).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.

Labeling—Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

USP Reference standards (11)—

USP Endotoxin RS

Identification—The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 279 nm when tested as directed for *Procedure* in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.45 USP Endotoxin Unit per μg of manganese.

pH (791): between 1.5 and 2.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products (1)*.

Assay—

Sodium chloride solution—Dissolve 1.8 g of sodium chloride in water, dilute with water to 2000 mL, and mix.

Manganese stock solution—Transfer 1.000 g of manganese to a 1000-mL volumetric flask, dissolve in 20 mL of nitric acid, dilute with 0.1 N hydrochloric acid to volume, and mix. This solution contains 1000 μg of manganese per mL. Store in a polyethylene bottle.

Standard preparations—Pipet 10 mL of the *Manganese stock solution* into a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 4.0, 5.0, and 6.0 mL, respectively, of this solution to separate 50-mL volumetric flasks, containing 10 mL of *Sodium chloride solution*, dilute the contents of each flask with water to volume, and mix. These *Standard preparations* contain, respectively, 1.6, 2.0, and 2.4 μg of manganese per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 1 mg of manganese, to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask. From the labeled amount of sodium chloride, if any, in the Injection, calculate the amount, in mg, of sodium chloride in the initial dilution, and add sufficient *Sodium chloride solution* to bring the total sodium chloride content in this flask to 9 mg. Dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the manganese emission line of 279 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy (852)*) equipped with a manganese hollow-cathode lamp and an air-acetylene flame, using a dilution of *Sodium chloride solution* (1:5) as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in μg per mL, of manganese, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, in μg per mL, of manganese in the

Assay preparation. Calculate the quantity, in mg, of manganese in each mL of the Injection taken by the formula:

$$0.5C/V$$

in which C is the concentration, in μg per mL, of manganese in the *Assay preparation*; and V is the volume, in mL, of Injection taken.

Manganese Chloride for Oral Solution

» Manganese Chloride for Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of manganese (Mn). It may contain one or more suitable flavors, sweetening agents, thickening agents, and stabilizers.

Packaging and storage—Preserve in tight, light-resistant, single-dose containers.

Labeling—The label contains directions for constitution of the powder and states the amount of manganese in a given volume of the Oral Solution obtained after constitution.

Identification—It meets the requirements of the tests for Chloride (191) and for Manganese (191).

Uniformity of dosage units (905)—

FOR POWDER PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR POWDER PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH (791): between 6.0 and 8.0, when constituted to 300 mL with water.

Osmolality and Osmolarity (785): 230 mOsmol pH 6.0 to 8.0.

Assay—

Sodium chloride solution, Manganese stock solution, and Standard preparations—Prepare as directed in the *Assay under Manganese Chloride Injection*.

Assay preparation—Constitute the Manganese Chloride for Oral Solution as directed in the labeling. Transfer about 25 mL, accurately measured, of the constituted Manganese Chloride for Oral Solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Proceed as directed for *Assay preparation* in the *Assay under Manganese Chloride Injection*, beginning with "Pipet 10 mL of this solution."

Procedure—Proceed as directed in the *Assay under Manganese Chloride Injection*. Calculate the quantity, in μg , of manganese in each mL of the constituted for Oral Solution taken by the formula:

$$500C/V$$

in which C is the concentration, in μg per mL, of the manganese in the *Assay preparation*; and V is the volume, in mL, of the constituted Manganese Chloride for Oral Solution taken.

Manganese Gluconate

$\text{C}_{12}\text{H}_{22}\text{MnO}_{14}$ 445.23

$\text{C}_{12}\text{H}_{22}\text{MnO}_{14} \cdot 2\text{H}_2\text{O}$ 481.26

Bis(D-gluconato-O¹,O²) manganese;

Manganese D-gluconate (1:2).

Anhydrous [6485-39-8].

DEFINITION

Manganese Gluconate is dried or contains two molecules of water of hydration. It contains NLT 98.0% and NMT 102.0% of manganese gluconate ($\text{C}_{12}\text{H}_{22}\text{MnO}_{14}$), calculated on the anhydrous basis.

IDENTIFICATION

• **A. IDENTIFICATION TESTS—GENERAL, Manganese (191):** A 50-mg/mL solution meets the requirements.

• **B. THIN-LAYER CHROMATOGRAPHY**

Standard solution: 10 mg/mL of USP Potassium Gluconate RS

Sample solution: 10 mg/mL of Manganese Gluconate, heating in a water bath at 60°, if necessary, to dissolve

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel

Application volume: 5 μL

Developing solvent system: Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)

Spray reagent: Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for about 10 min.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in color, size, and R_f value to that of the *Standard solution*.

ASSAY

• **PROCEDURE**

Sample: 700 mg of Manganese Gluconate

Blank: 50 mL of water

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.05 M edetate disodium VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in 50 mL of water. Add 1 g of ascorbic acid and 10 mL of ammonia-ammonium chloride buffer TS and 0.1 mL of eriochrome black TS. Titrate with the *Titrant* until the solution is deep blue in color. Perform the blank determination.

Calculate the percentage of manganese gluconate ($\text{C}_{12}\text{H}_{22}\text{MnO}_{14}$) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times M \times F/W\} \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

M = actual molarity of the *Titrant* (mmol/mL)

F = equivalency factor, 445.2 mg/mmol

W = *Sample* weight (mg)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **CHLORIDE AND SULFATE, Chloride (221)**
Standard: 0.70 mL of 0.020 N hydrochloric acid
Sample: 1.0 g of Manganese Gluconate
Acceptance criteria: NMT 0.05%
- **CHLORIDE AND SULFATE, Sulfate (221)**
Standard: 4.0 mL of 0.020 N sulfuric acid
Sample: 2.0 g of Manganese Gluconate
Acceptance criteria: NMT 0.2%

Delete the following:

- **HEAVY METALS (231)**
Test preparation: Dissolve 1 g of Manganese Gluconate in 10 mL of water, add 6 mL of 3 N hydrochloric acid, and dilute with water to 25 mL.
Acceptance criteria: NMT 20 ppm (Official 1-Jan-2018)

LEAD

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

Ascorbic acid–sodium iodide solution: 100 mg/mL of ascorbic acid and 192.5 mg/mL of sodium iodide

Trioctylphosphine oxide solution: 50 mg/mL of trioctylphosphine oxide in 4-methyl-2-pentanone.

[CAUTION—This solution causes irritation. Avoid contact with eyes, skin, and clothing. Take special precautions in disposing of unused portions of solutions to which this reagent is added.]

Standard solution: Transfer 5.0 mL of lead nitrate stock solution TS, to a 100-mL volumetric flask. Dilute with water to volume. Transfer 2.0 mL of the resulting solution to a 50-mL volumetric flask. Add 10 mL of 9 N hydrochloric acid and 10 mL of water. Add 20 mL of *Ascorbic acid–sodium iodide solution* and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Standard solution*, and it contains 2.0 µg/mL of lead.

Sample solution: To a 50-mL volumetric flask add 1.0 g of Manganese Gluconate, 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Sample solution*.

Blank: To a 50-mL volumetric flask add 10 mL of 9 N hydrochloric acid, 10 mL of water, 20 mL of *Ascorbic acid–sodium iodide solution*, and 5.0 mL of *Trioctylphosphine oxide solution*. Shake for 30 s, and allow to separate. Add water to bring the organic solvent layer into the neck of the flask, shake again, and allow to separate. The organic layer is the *Blank*, and it contains 0 µg/mL of lead.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 283.3 nm

Lamp: Lead hollow-cathode

Flame: Air–acetylene

System suitability

Samples: *Standard solution* and *Blank*

Suitability requirements: The absorbance of the *Standard solution* and the absorbance of the *Blank* are significantly different.

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Concomitantly determine the absorbances of the *Blank*, *Standard solution*, and the *Sample solution*. Use the *Blank* to set the instrument to zero.

Acceptance criteria: The absorbance of the *Sample solution* does not exceed that of the *Standard solution* (NMT 10 ppm).

REDUCING SUBSTANCES

Sample: 1.0 g of Manganese Gluconate

Blank: Proceed as directed in the *Analysis*, omitting the *Sample*.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Residual titration

Titrant: 0.1 N iodine VS

Back-titrant: 0.1 N sodium thiosulfate VS

Endpoint detection: Visual

Analysis: Transfer the *Sample* to a 250-mL conical flask, dissolve in 10 mL of water, and add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of *Titrant*, and 10 mL of 3 N hydrochloric acid, and titrate with *Back-titrant*, adding 3 mL of starch TS as the endpoint is approached. Perform the blank determination.

Calculate the percentage of reducing substances (as dextrose) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

V_B = Back-titrant volume consumed by the *Blank* (mL)

V_S = Back-titrant volume consumed by the *Sample* (mL)

N = Back-titrant normality (mEq/mL)

F = equivalency factor, 27 mg/mEq

W = Sample weight (mg)

Acceptance criteria: NMT 1.0%

SPECIFIC TESTS

• WATER DETERMINATION, Method I (921)

Analysis: Proceed as directed in the chapter. Maintain the mixture containing the *Test preparation* at 50°, and stir for 30 min before titrating with the *Reagent*.

Acceptance criteria

Where labeled as the dried form: 3.0%–9.0%

Where labeled as the dihydrate: 6.0%–9.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** The label indicates whether it is the dried or the dihydrate form.
- **USP REFERENCE STANDARDS (11)**
USP Potassium Gluconate RS

Manganese Sulfate

MnSO₄ · H₂O 169.02
Sulfuric acid, manganese(2+) salt (1:1) monohydrate;
Manganese(2+) sulfate (1:1) monohydrate [10034-96-5].
Anhydrous 151.00
[7785-87-7].

DEFINITION

Manganese Sulfate contains NLT 98.0% and NMT 102.0% of MnSO₄ · H₂O.

IDENTIFICATION

• A. IDENTIFICATION TESTS—GENERAL, Manganese (191)

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Sulfate (191)

Sample solution: 100 mg/mL

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Sample: 350 mg

Analysis: Dissolve the *Sample* in 200 mL of water. Add 10 mg of ascorbic acid. Begin the titration by adding 25 mL of 0.05 M edetate disodium VS using a suitable buret, then add 10 mL of ammonia–ammonium chloride buffer TS and 0.15 mL of eriochrome black TS.

Complete the titration with 0.05 M edetate disodium VS to a blue endpoint. Each mL of 0.05 M edetate disodium is equivalent to 8.451 mg of MnSO₄ · H₂O.

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• SUBSTANCES NOT PRECIPITATED BY AMMONIUM SULFIDE

Sample: 2.0 g

Analysis: Dissolve the *Sample* in 90 mL of water, add 5 mL of ammonium hydroxide, warm the solution, and pass hydrogen sulfide through the solution for about 30 min. Dilute with water to 100 mL, mix, and allow the precipitate to settle. Decant the supernatant through a filter, transfer 50 mL of the clear filtrate to a tared dish, evaporate to dryness, and ignite, gently at first and finally at 800 ± 25°.

Acceptance criteria: The weight of the residue does not exceed 5 mg (NMT 0.5%).

SPECIFIC TESTS

• LOSS ON IGNITION (733)

Analysis: Ignite a sample at 450° to constant weight: it loses 10.0%–13.0% of its weight.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

Manganese Sulfate Injection

» Manganese Sulfate Injection is a sterile solution of Manganese Sulfate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of manganese (Mn).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I or Type II glass.

Labeling—Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

USP Reference standards (11)—

USP Endotoxin RS

Identification—The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 279 nm when tested as directed for *Procedure* in the *Assay*.

Bacterial Endotoxins Test (85)—It contains not more than 0.45 USP Endotoxin Unit per µg of manganese.

pH (791): between 2.0 and 3.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Sodium chloride solution, *Manganese stock solution*, and *Standard preparations*—Prepare as directed in the *Assay* under *Manganese Chloride Injection*.

Assay preparation—Transfer an accurately measured volume of *Injection*, equivalent to about 1 mg of manganese, to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of this solution into a 50-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Manganese Chloride Injection*.

Mannitol

Portions of the monograph text that are national USP text, and are not part of the harmonized text, are marked with symbols (✱) to specify this fact.

C₆H₁₄O₆

D-Mannitol [69-65-8].

182.17

DEFINITION

Mannitol contains NLT 97.0% and NMT 102.0% of mannitol (C₆H₁₄O₆), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

If the spectra shows differences, proceed as directed.

Standard solution: Dissolve 25 mg of USP Mannitol RS in a glass vial with 0.25 mL of distilled water without heating. The solution is clear. Evaporate to dryness by one of the following methods. Heat in a microwave oven with a power range of 600–700 W for 20 min, or heat in an oven at 100° for 1 h, then gradually apply vacuum until a dry residue is obtained. Non-sticky, white, or slightly yellowish powders are obtained.

Sample solution: Dissolve 25 mg of Mannitol in a glass vial with 0.25 mL of distilled water without heating. The solution is clear. Evaporate to dryness by one of the following methods. Heat in a microwave oven with a power range of 600–700 W for 20 min, or heat in an oven at 100° for 1 h, then gradually apply vacuum until a dry residue is obtained. Non-sticky, white, or slightly yellowish powders are obtained.

Analysis: Record new spectra using the residues from the *Standard solution* and the *Sample solution*.

ASSAY

• PROCEDURE

Mobile phase: Degassed water

System suitability solution A: 25.0 mg/mL each of sorbitol and USP Mannitol RS

System suitability solution B: 1.0 mg/mL each of maltitol and isomalt

Standard solution A: 50.0 mg/mL of USP Mannitol RS

Standard solution B: Dilute 2.0 mL of the *Sample solution* with water to 100.0 mL.

Standard solution C: Dilute 0.5 mL of *Standard solution B* with water to 20.0 mL.

Sample solution: 50.0 mg/mL of Mannitol

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: Refractive index

Column: 7.8-mm × 30-cm; packing L19

Temperatures

Detector: 40° (maintain at a constant temperature)

Column: 85 ± 2°

Flow rate: 0.5 mL/min

Injection volume: 20 µL

Run time: NLT 1.5 times the retention time of the mannitol peak. [NOTE—The retention time for mannitol is about 20 min.]

System suitability

Samples: *System suitability solution A*, *System suitability solution B*, *Standard solution B*, and *Standard solution C*

Suitability requirements

Resolution: NLT 2.0 between sorbitol and mannitol, *System suitability solution A*

Analysis

Samples: *Standard solution A* and *Sample solution*

Calculate the percentage of mannitol (C₆H₁₄O₆) in the portion of Mannitol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from *Standard solution A*

C_S = concentration of USP Mannitol RS in *Standard solution A* (mg/mL)

C_U = concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

IMPURITIES

• RELATED SUBSTANCES

Mobile phase, System suitability solution A, System suitability solution B, Standard solution B, Standard solution C, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution B*, *Standard solution C*, and *Sample solution*

Acceptance criteria: See *Table 1* for the relative retention times.

Table 1

Name	Relative Retention Time
Isomalt (1st peak)	0.60
Maltitol	0.69
Isomalt (2nd peak)	0.73
Mannitol	1.0
Sorbitol	1.2

[NOTE—Impurity A—Sorbitol; Impurity B—Maltitol; Impurity C—Isomalt.]

[NOTE—Isomalt elutes in two peaks.]

[NOTE—Coelution of impurity B and the second peak of impurity C may be observed.]

Disregard limit: NMT 0.05%; any peak NMT the area of the principal peak obtained with *Standard solution C*

Sorbitol: NMT 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

Sum of isomalt and maltitol: NMT 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

Unspecified impurities: NMT 0.10% for each impurity; NMT twice the area of the principal peak obtained with *Standard solution C*

Total impurities: 2.0%; NMT the area of the principal peak obtained with *Standard solution B*

• REDUCING SUGARS

Ferric sulfate solution: Dissolve 50 g of ferric sulfate in an excess of water, add 200 mL of sulfuric acid, and dilute with water to 1000 mL.

Copper sulfate solution: 69.2 mg/mL of copper sulfate (CuSO₄ · 5H₂O) in water

Sodium potassium tartrate solution: Dissolve 173 g of sodium potassium tartrate (C₄H₄KNaO₆ · 4H₂O) and 50 g of sodium hydroxide in 400 mL of water. Heat to boiling, allow to cool, and dilute with carbon dioxide-free water to 500 mL.

Cupri-tartaric solution: Mix equal volumes of *Copper sulfate solution* and *Sodium potassium tartrate solution* immediately before use.

Sample: 7.0 g

Analysis: To the *Sample* add 13 mL of water. Boil gently with 40 mL of *Cupri-tartaric solution* for 3 min, and allow to stand for about 2 min. A precipitate is formed. Pass through a sintered-glass filter (10–16 µm) coated with diatomaceous earth or a sintered-glass filter (5–10 µm). Wash the precipitate with hot water (at about 50°–60°) until the washing is no longer alkaline, and pass the washings through the filter described above. Discard all the filtrate at this step. Immediately dissolve the precipitate in 20 mL of *Ferric sulfate solution*, pass through the filter described above in a clean flask, and wash the filter with 15–20 mL of water. Combine the washings and the filtrate, heat to 80°, and titrate with 0.02 M potassium permanganate VS.

Acceptance criteria: NMT 0.1%, expressed as glucose; NMT 3.2 mL of 0.02 M potassium permanganate VS is required to change the color of the solution. The green color turns to pink, and the color persists at least 10 s.

• NICKEL

Sample solution: Suspend 10.0 g of Mannitol in 30 mL of dilute acetic acid [115–125 g/L of acetic acid (C₂H₄O₂)], add water, and shake to dissolve. Dilute with water to 100.0 mL. Add 2.0 mL of a saturated solution of ammonium pyrrolidinedithiocarbamate (C₅H₁₂N₂S₂) (about 10 g/L) and 10.0 mL of water-saturated methyl isobutyl ketone (C₆H₁₂O, 4-methyl-2-pentanone), and then shake for 30 s protected from bright light. Allow the layers to separate, and use the methyl isobutyl ketone layer.

Blank solution: Treat water-saturated methyl isobutyl ketone as described for preparation of the *Sample solution*, omitting the mannitol.

Standard solutions: Prepare three reference solutions in the same manner as the *Sample solution* but adding 0.5, 1.0, and 1.5 mL, respectively, of nickel standard solution TS [10 ppm nickel (Ni)] in addition to the 10.0 g of the substance to be examined.

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 232.0 nm

Lamp: Nickel hollow-cathode

Flame: Air-acetylene

Analysis

Samples: *Sample solution* and *Standard solutions*

Set the zero of the instrument using the blank. Record the average of the steady readings for each of the *Standard solutions* and the *Sample solution*. Between each measurement rinse with water, and ascertain that the reading returns to zero with the blank. Plot the absorbances of the *Standard solutions* and the *Sample solution* versus the added quantity of nickel. Extrapolate

late the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of nickel in the *Sample solution*.

Acceptance criteria: NMT 1 µg/g

SPECIFIC TESTS

• MELTING RANGE OR TEMPERATURE (741), Class I

Melting point: 165°–170°

• APPEARANCE OF SOLUTION

Hydrazine sulfate solution: 10.0 mg/mL of hydrazine sulfate. Allow to stand for 4–6 h.

Methenamine solution: 2.5 g of methenamine in 25 mL of water, in a ground-glass-stoppered flask

Primary opalescent suspension: To the *Methenamine solution*, add 25.0 mL of the *Hydrazine sulfate solution*. Mix, and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.

Opalescence standard: Dilute 15.0 mL of the *Primary opalescent suspension* with water to 1000.0 mL. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspension: To 5.0 mL of *Opalescence standard* add 95.0 mL of water. Mix, and shake before use.

Standard solution: Pipet 3.0 mL of ferric chloride CS, 3.0 mL of cobaltous chloride CS, and 2.4 mL of cupric sulfate CS into a 1-L volumetric flask. Dilute with 1% (w/v) hydrochloric acid to volume.

Sample solution: 100.0 mg/mL of Mannitol

Analysis: Compare the color, clarity, and opalescence of equal volumes of the *Reference suspension*, *Standard solution*, and *Sample solution*.

Acceptance criteria: The *Sample solution* is clear and colorless; its clarity is the same as that of water, or its opalescence is not more pronounced than that of the *Reference suspension*, and it is not more intensely colored than the *Standard solution*.

• LOSS ON DRYING (731)

Sample: 1.000 g

Analysis: Dry the *Sample* at 105° for 4 h.

Acceptance criteria: NMT 0.5%

• CONDUCTIVITY

Sample: 20.0 g

Analysis: Dissolve the *Sample* in carbon dioxide-free water prepared from distilled water by heating to 40°–50°, and dilute with the same solvent to 100 mL. After cooling, measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Acceptance criteria: NMT 20 µS/cm at 25°

• MICROBIAL ENUMERATION TESTS (61) and TESTS FOR SPECIFIED MICROORGANISMS (62):

The total aerobic microbial count (TAMC) is NMT 10³ cfu/g, and the total combined molds and yeasts count is NMT 10² cfu/g. It meets the requirements of the test for absence of *Escherichia coli*. If intended for use in the manufacture of parenteral dosage forms, the TAMC is NMT 10² cfu/g.

• BACTERIAL ENDOTOXINS TEST (85):

If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 4 IU/g for parenteral dosage forms with a concentration of 100 g/L or less of mannitol, and less than 2.5 IU/g for parenteral dosage forms with a concentration of more than 100 g/L of mannitol

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed containers.

• LABELING

The label states, where applicable, the maximum concentration of bacterial endotoxins.

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

• USP REFERENCE STANDARDS (11)

USP Endotoxin RS

USP Mannitol RS

Mannitol Injection

» Mannitol Injection is a sterile solution, which may be supersaturated, of Mannitol in Water for Injection. It may require warming or autoclaving before use if crystallization has occurred. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of mannitol (C₆H₁₄O₆). It contains no antimicrobial agents.

Packaging and storage—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

Labeling—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL. The label also states that it should be warmed before use to dissolve any crystals that may have formed.

USP Reference standards (11)—

USP Endotoxin RS

USP Mannitol RS

Identification—

A: Evaporate a portion of Injection on a steam bath to dryness, and dry the residue at 105° for 4 hours. To 3 mL of freshly prepared solution of catechol in water (1 in 10) add 6 mL of sulfuric acid with cooling. Place 3 mL of this solution in each of two separate test tubes. To one tube add 0.3 mL of water (reagent blank) and to the other add 0.3 mL of a solution of it in water (1 in 10). Heat the tubes over an open flame for about 30 seconds: the solution in the tube containing mannitol is dark pink or wine red, and the solution in the tube containing the reagent blank is light pink.

B: The retention time for the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Specific rotation (781)—+137° to +145°. Transfer an accurately measured volume of Injection, equivalent to about 1 g of mannitol as determined by the *Assay*, to a 100-mL volumetric flask. Add 40 mL of a 1-in-10 ammonium molybdate solution, previously filtered if necessary. Add 20 mL of 1 N sulfuric acid, and dilute with water to volume.

Bacterial Endotoxins Test (85)—It contains not more than 0.04 USP Endotoxin Unit per mg of mannitol where the labeled amount of mannitol in the Injection is 10% or less, and not more than 2.5 USP Endotoxin Units per g of mannitol where the labeled amount of mannitol in the Injection is greater than 10%.

pH (791): between 4.5 and 7.0, determined potentiometrically, on a portion to which 0.30 mL of saturated potassium chloride solution has been added for each 100 mL, and which previously has been diluted with water, if necessary, to a concentration of not more than 5% of mannitol.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Mobile phase—Use degassed water.

Resolution solution—Dissolve sorbitol and USP Mannitol RS in water to obtain a solution having concentrations of about 4.8 mg per mL of each.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index detector that is maintained at a constant temperature and a 4-mm × 25-cm column that contains packing L19. The column temperature is maintained at a temperature between 30° and 85° controlled within ±2° of the selected temperature, and the flow rate is about 0.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%. In a similar manner, chromatograph the *Resolution solution*: the resolution, *R*, between the sorbitol and mannitol peaks is not less than 2.0.

Standard preparation—Dissolve an accurately weighed quantity of USP Mannitol RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 5 mg per mL.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 500 mg of mannitol, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Separately inject equal volumes (about 20 µL) of the *Assay preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of mannitol (C₆H₁₄O₆) in each mL of the Injection taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which *V* is the volume, in mL, of Injection taken; and the other terms are as defined therein.

Mannitol in Sodium Chloride Injection

» Mannitol in Sodium Chloride Injection is a sterile solution of Mannitol and Sodium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of C₆H₁₄O₆ and NaCl. It contains no antimicrobial agents.

Labeling—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

USP Reference standards (11)—

USP Endotoxin RS

USP Mannitol RS

Identification—

A: Evaporate a portion of Injection on a steam bath to dryness, and dry the residue at 105° for 4 hours: the residue responds to the *Identification test A* under *Mannitol Injection*.

B: It responds to the tests for *Sodium* (191) and for *Chloride* (191).

Bacterial Endotoxins Test (85)—It contains not more than 0.04 USP Endotoxin Unit per mg of mannitol.

pH (791): between 4.5 and 7.0.

Other requirements—It meets the requirements for *Packaging and storage* under *Mannitol Injection*. It meets also the requirements under *Injections and Implanted Drug Products* (1).

Assay for mannitol—Proceed with Injection as directed in the *Assay* under *Mannitol Injection*.

Assay for sodium chloride—Proceed with Injection as directed in the *Assay* under *Sodium Chloride Injection*.

Maprotiline Hydrochloride

C₂₀H₂₃N · HCl 313.86
9,10-Ethanoanthracene-9(10*H*)-propanamine, *N*-methyl-, hydrochloride;
N-Methyl-9,10-ethanoanthracene-9(10*H*)-propylamine hydrochloride [10347-81-6].

DEFINITION

Maprotiline Hydrochloride contains NLT 99.0% and NMT 101.0% of the labeled amount of maprotiline hydrochloride (C₂₀H₂₃N · HCl), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. ULTRAVIOLET ABSORPTION** (197U)

Sample solution: 100 µg/mL in methanol

Acceptance criteria: Absorptivities at 266 nm and 272 nm, calculated on the dried basis, do not differ by more than 3.0%.

• **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

Sample solution: 5 mg/mL

Acceptance criteria: Responds to the tests when tested as specified for alkaloidal hydrochloride

ASSAY

• **PROCEDURE**

Sample solution: 600 mg of Maprotiline Hydrochloride in 25 mL of mercuric acetate TS

Blank: Mercuric acetate TS

Titrimetric system

(See *Titrimetry* (541).)

Mode: Potentiometric

Titrant: 0.1 N perchloric acid VS

Analysis: Titrate the *Sample solution* with *Titrant* using a glass electrode and a calomel electrode containing saturated lithium chloride in glacial acetic acid. Perform a blank determination. Each mL of 0.1 N perchloric acid is equivalent to 31.39 mg of maprotiline hydrochloride (C₂₀H₂₃N · HCl).

Acceptance criteria: 99.0%–101.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

• **HEAVY METALS, Method II** (231): NMT 10 ppm • (Official 1-

Jan-2018)

• **ORGANIC IMPURITIES**

Mobile phase: Dissolve 0.6 g of ammonium acetate in 200 mL of water, and add 2 mL of a 70-g/L ammonia solution, 150 mL of 2-propanol, and 650 mL of methanol. The resulting apparent pH value is 8.2–8.4.

Standard solution: 2 µg/mL of USP Maprotiline Hydrochloride RS in *Mobile phase*

System suitability solution: 1 mg/mL of USP Maprotiline Hydrochloride RS and 0.1 mg/mL of USP Maprotiline Related Compound D RS in *Mobile phase*

Sample solution: 1 mg/mL of Maprotiline Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 272 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: 1.5 times the retention time of maprotiline

System suitability

Sample: *System suitability solution*

Suitability requirements

[NOTE—See *Table 1* for relative retention times.]

Resolution: 1.8–3.2 between the maprotiline related compound D and maprotiline peaks

[NOTE—If necessary, adjust the pH of the *Mobile phase*, in steps of 0.1 pH unit, by adding a 50% v/v solution of acetic acid if the resolution is less than 1.8, or by adding a 70-g/L solution of ammonia if the resolution is greater than 3.2.]

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Maprotiline Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak area of any impurity from the *Sample solution*

r_s = peak area of maprotiline from the *Standard solution*

C_s = concentration of USP Maprotiline Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Maprotiline Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*. Disregard any peak representing less than 0.05% of the area of the main peak.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

3-(9,10-Dihydro-9,10-ethanoanthracen-9-yl)-N-methylprop-2-en-1-amine.

C₂₀H₂₂N 276.4

Maprotiline Hydrochloride Tablets

DEFINITION

Maprotiline Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of maprotiline hydrochloride (C₂₀H₂₃N · HCl).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHY

Standard solution: 20 mg/mL of USP Maprotiline Hydrochloride RS in methanol

Sample solution: Transfer a portion of powdered Tablets, equivalent to 100 mg of maprotiline hydrochloride, to a glass-stoppered centrifuge tube. Add 5.0 mL of methanol to the tube, sonicate for 10 min, shake by mechanical means for 10 min, and centrifuge.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Adsorbent: 0.25-mm layer of chromatographic silica gel that has been prewashed with chloroform by allowing chloroform to travel the full length of the plate, and dried at 100° for 30 min

Application volume: 5 µL

Developing solvent system: Secondary butyl alcohol, ethyl acetate, and 2 N ammonium hydroxide (6:3:1)

Analysis

Samples: *Standard solution* and *Sample solution*

In a suitable chromatographic chamber, place a volume of the *Developing solvent system* sufficient to develop a chromatogram. Place a beaker containing 25 mL of ammonium hydroxide in the bottom of the chamber, and allow it to equilibrate for 1 h. Apply *Samples* and allow the spots to dry. Develop the chromatograms until the solvent front has moved three-fourths of the length of the plate, remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Expose the

plate to hydrogen chloride vapor for 30 min, and expose it to a high-intensity UV light irradiator (1000 to 1600 watts) for 5 min. **[CAUTION—UV irradiators emit UV radiation that is harmful to eyes and skin.]** Compare the chromatograms under long-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

- **B.** The retention time of the major peak in the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Dissolve 4 g of tetramethylammonium chloride in 495 mL of water, and add 500 mL of acetonitrile and 1 mL of phosphoric acid.

Standard solution: 0.75 mg/mL of USP Maprotiline Hydrochloride RS prepared as follows. Transfer a suitable quantity of the USP Maprotiline Hydrochloride RS to a suitable volumetric flask. Add 10% of the flask volume each of methanol and 0.1 N hydrochloric acid. Sonicate for 5 min, and then dilute to volume with water.

Sample stock solution: Transfer NLT 15 Tablets to a 500-mL volumetric flask, add 100 mL of 0.1 N hydrochloric acid, sonicate, and shake occasionally for 5 min to disintegrate the Tablets. Add 100 mL of methanol, shake, and sonicate for 5 min. Dilute with water to volume, and centrifuge. Use the supernatant.

Sample solution: Nominally 0.75 mg/mL of maprotiline hydrochloride from *Sample stock solution* and water.

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 272 nm

Column: 8-mm × 10-cm; 10-μm packing L10

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1500 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of maprotiline hydrochloride ($C_{20}H_{23}N \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of maprotiline from the *Sample solution*

r_s = peak response of maprotiline from the *Standard solution*

C_s = concentration of USP Maprotiline Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of maprotiline hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: Dilute hydrochloric acid (7 in 1000); 900 mL

Apparatus 2: 50 rpm

Time: 60 min

Standard solution: USP Maprotiline Hydrochloride RS in *Medium*

Sample solution: Sample per *Dissolution* (711).

Instrumental conditions

Mode: UV

Analytical wavelengths: About 268 nm absorbance minimum; about 272 nm absorbance maximum

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the percentage of the labeled amount of maprotiline hydrochloride ($C_{20}H_{23}N \cdot HCl$) dissolved from UV absorbances, using the difference between the absorbance maximum and the absorbance minimum of filtered portions of the *Sample solution*, suitably diluted with *Medium*, in comparison with the *Standard solution* having a known concentration of USP Maprotiline Hydrochloride RS.

Tolerances: NLT 75% (Q) of the labeled amount of maprotiline hydrochloride ($C_{20}H_{23}N \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** (11)
USP Maprotiline Hydrochloride RS

Marbofloxacin Compounded Oral Suspension, Veterinary

DEFINITION

Marbofloxacin Compounded Oral Suspension, Veterinary contains NLT 90.0% and NMT 110.0% of the labeled amount of marbofloxacin ($C_{17}H_{19}FN_4O_4$).

Prepare Marbofloxacin Compounded Oral Suspension, Veterinary 25 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Marbofloxacin powder	2.5 g
Purified Water	A small amount
Vehicle: 1:1 mixture of Ora-Plus ^a and Ora-Sweet ^a ; or Ora-Blend ^a , a sufficient quantity to make	100 mL

^aPerrigo Pharmaceuticals, Allegan, MI.

Wet the *Marbofloxacin powder* with a small amount of *Purified Water* and triturate to make a smooth paste. Add the *Vehicle* to make the mortar contents pourable. Transfer the contents of the mortar stepwise and quantitatively to a calibrated container using the *Vehicle*. Add sufficient *Vehicle* to bring to final volume, and mix well.

ASSAY

PROCEDURE

Solution A: 10 mM ammonium formate containing 0.1% (v/v) formic acid

Solution B: Methanol containing 0.1% formic acid

Mobile phase: See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	90	10
0.5	90	10
23.0	70	30
23.5	70	30
23.6	0	100
26	0	100

Table 1 (Continued)

Time (min)	Solution A (%)	Solution B (%)
26.1	90	10
30	90	10

Standard solution: 0.4 mg/mL of marbofloxacin in Solution A

Sample solution: Transfer 1.6 mL of Oral Suspension, Veterinary to a 100-mL volumetric flask, dilute with Solution A to volume, and mix well. Pass through a PVDF filter of 0.2- μ m pore size.

Chromatographic system
(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV-Vis 327 nm

Columns

Guard: Packing L1

Analytical: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 50°

Flow rate: 1.5 mL/min

Injection volume: 2 μ L

System suitability

Sample: Standard solution

[NOTE—The retention time for marbofloxacin is about 6.2 min.]

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of marbofloxacin ($C_{17}H_{19}FN_4O_4$) in the portion of Oral Suspension, Veterinary taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of marbofloxacin from the Sample solution

r_S = peak response of marbofloxacin from the Standard solution

C_S = concentration of marbofloxacin in the Standard solution (mg/mL)

C_U = nominal concentration of marbofloxacin in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- PH (791):** 6.2–7.2

ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Package in tight, light-resistant, plastic containers. Store in a refrigerator (2°–8°) or at controlled room temperature.
- BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored in a refrigerator (2°–8°) or at controlled room temperature. [NOTE—A slight darkening in yellow color may occur in the suspension with 1:1 Ora-Plus and Ora-Sweet that does not affect the strength of the preparation.]
- LABELING:** Label it to indicate that it is for veterinary use only. Label it to indicate that it is to be well shaken before use, and to state the Beyond-Use Date.

Mazindol

$C_{16}H_{13}ClN_2O$ 284.74

3H-imidazo[2,1-a]isoindol-5-ol, 5-(4-chlorophenyl)-2,5-dihydro-, (±)-

(±)-5-(p-Chlorophenyl)-2,5-dihydro-3H-imidazo[2,1-a]isoindol-5-ol [22232-71-9].

» Mazindol contains not less than 98.0 percent and not more than 102.0 percent of $C_{16}H_{13}ClN_2O$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Mazindol RS

Clarity and color of solution—A 1 in 100 solution of Mazindol in a mixture of chloroform and methanol (9:1) is clear and not darker in color than a solution prepared by mixing equal volumes of Matching Fluid C (see Color and Achromicity <631>) and water.

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: 0.6 N hydrochloric acid.

Absorptivities at 272 nm, calculated on the dried basis, do not differ by more than 3.0%.

Loss on drying (731)—Dry it in vacuum at 60° for 2 hours; it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. • (Official 1-Jan-2018)

Sulfate (221)—Triturate a 500-mg portion with 10 mL of water in a mortar. Filter the suspension through a water-washed filter, and rinse the mortar and filter with 30 mL of water, collecting the combined filtrate and washings in a 50-mL color-comparison tube. The filtrate shows no more sulfate than corresponds to 0.20 mL of 0.020 N sulfuric acid (0.04%).

Chromatographic purity—Dissolve 10 mg in 2.0 mL of a mixture of chloroform and methanol (9:1) to obtain the test solution. Dissolve a suitable quantity of USP Mazindol RS in a mixture of chloroform and methanol (9:1) to obtain a Standard solution having a concentration of 5.0 mg per mL. Dilute portions of this solution quantitatively and stepwise with the mixture of chloroform and methanol (9:1) to obtain a series of diluted standard solutions having concentrations of 0.100, 0.050, 0.025, and 0.0125 mg per mL, respectively. Separately apply a 20- μ L portion of the test solution and 20- μ L portions of the Standard solution and each diluted standard solution to a suitable thin-layer chromatographic plate (see Chromatography <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, alcohol, and ammonium hydroxide (80:20:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wave-length UV light: the chromatograms show principal spots at about the same R_f value. Estimate the concentration of any

secondary spots present in the chromatogram from the test solution by comparison with the diluted standard solutions: the principal spots from the 0.100, 0.050, 0.025, and 0.0125 mg per mL dilutions are equivalent to 2.0%, 1.0%, 0.50%, and 0.25% of impurities, respectively. No individual impurity is greater than 1.0%, and the sum of the impurities is not greater than 2.0%.

Assay—Transfer about 230 mg of Mazindol, accurately weighed, to a suitable flask, dissolve in 40 mL of glacial acetic acid, add 3 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to an emerald-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 28.47 mg of $C_{16}H_{13}ClN_2O$.

Mazindol Tablets

» Mazindol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mazindol ($C_{16}H_{13}ClN_2O$).

Packaging and storage—Preserve in tight containers, at a temperature not exceeding 25°.

USP Reference standards (11)—
USP Mazindol RS

Identification—Place a portion of powdered Tablets, equivalent to about 1 mg of mazindol, in a suitable flask. Add 40 mL of methanol, shake by mechanical means for not less than 5 minutes, and heat for several minutes on a steam bath to boiling. Cool, dilute with methanol to about 100 mL, and filter. Separate the filtrate into two approximately equal portions, add 2 drops of hydrochloric acid to one portion, and mix: the UV absorption spectra of the solutions so obtained exhibit maxima and minima at the same wavelengths as those of similar solutions prepared from USP Mazindol RS, concomitantly measured.

Dissolution (711)—

Medium: 0.01 N hydrochloric acid; 500 mL.

Apparatus 2: 50 rpm.

Time: 120 minutes.

Determine the amount of $C_{16}H_{13}ClN_2O$ dissolved by employing the following method.

Mobile phase—Mix 11.50 g of monobasic ammonium phosphate and 1.32 g of dibasic ammonium phosphate with water to obtain 1000 mL of an ammonium phosphate buffer. The *Mobile phase* is a suitably filtered and degassed mixture of the ammonium phosphate buffer and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 271-nm detector and a 4-mm × 30-cm column that contains packing L7. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the Standard solution, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 3.0%.

Procedure—Inject an appropriate volume (50 µL to 500 µL) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{16}H_{13}ClN_2O$ dissolved in comparison with a Standard solution having a known concentration of USP Mazindol RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{16}H_{13}ClN_2O$ is dissolved in 120 minutes.

Uniformity of dosage units (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

Dye solution—Dissolve 100 mg of bromocresol purple in 1000 mL of 0.33 N acetic acid, and mix.

Standard solution—Dissolve an accurately weighed quantity of USP Mazindol RS in 0.33 N acetic acid, and dilute quantitatively and stepwise with 0.33 N acetic acid to obtain a solution having a known concentration of about 20 µg per mL.

Test solution—Mix 1 finely powdered Tablet with an accurately measured volume of 0.33 N acetic acid, sufficient to provide a solution having a concentration of about 20 µg of mazindol per mL, shake by mechanical means for 30 minutes, and filter, discarding the first few mL of the filtrate.

Procedure—Transfer 25.0 mL each of the *Standard solution*, the *Test solution*, and 0.33 N acetic acid to provide the blank, to individual 125-mL separators. Add 30 mL of *Dye solution* and 50.0 mL of chloroform to each, and shake by mechanical means for 15 minutes. Allow the layers to separate, and filter the chloroform layers. Concomitantly determine the absorbances of the filtered solutions obtained from the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at about 420 nm, using the blank to set the instrument. Calculate the quantity, in mg, of mazindol ($C_{16}H_{13}ClN_2O$) in the Tablet by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of mazindol in the Tablet; *C* is the concentration, in µg per mL, of USP Mazindol RS in the *Standard solution*; *D* is the concentration, in µg per mL, of mazindol in the *Test solution*, based on the labeled quantity per Tablet and the extent of dilution; and *A_U* and *A_S* are the absorbances of the solutions from the *Test solution* and the *Standard solution*, respectively.

Assay—

Internal standard solution—Dissolve 50 mg of amitriptyline hydrochloride in 250 mL of methanol, and mix.

Standard preparation—Transfer about 32 mg of USP Mazindol RS, accurately weighed, to a 100-mL volumetric flask, add about 50 mL of *Internal standard solution*, and shake by mechanical means for 30 minutes. Dilute with *Internal standard solution* to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 8 mg of mazindol, to a suitable flask, add 25.0 mL of *Internal standard solution*, and shake by mechanical means for 30 minutes. Pass through a fine-porosity, sintered-glass filter, discarding the first few mL of the filtrate.

Mobile phase—Transfer 200 mL of aqueous 0.01 M dibasic ammonium phosphate to a 1000-mL volumetric flask, dilute with methanol to volume, and mix. Pass through a 0.5-µm porosity polytetrafluoroethylene filter, and degas under vacuum. Protect this solution from light.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L10. Inject three replicate portions of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, is not less than 2.0; and the relative standard deviation is not more than 3.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for mazindol and amitriptyline hydrochloride. Calculate the quantity, in mg, of mazindol

(C₁₆H₁₃ClN₂O) in the portion of Tablets taken by the formula:

$$25C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Mazindol RS in the *Standard preparation*; and R_U and R_S are the peak response ratios of mazindol to amitriptyline hydrochloride obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mebendazole

C₁₆H₁₃N₃O₃ 295.29
Carbamic acid, (5-benzoyl-1H-benzimidazol-2-yl), methyl ester;
Methyl 5-benzoyl-2-benzimidazolecarbamate [31431-39-7].

DEFINITION

Mebendazole contains NLT 98.0% and NMT 102.0% of mebendazole (C₁₆H₁₃N₃O₃), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Solution A: 7.5 g/L of ammonium acetate

Solution B: Acetonitrile

Mobile phase: See Table 1.

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• USP REFERENCE STANDARDS (11)

USP Mebendazole RS

USP Mebendazole Related Compound D RS

Methyl 5-benzoyl-1-methylbenzimidazol-2-ylcarbamate.

C₁₇H₁₅N₃O₃ 309.32

Mebendazole Oral Suspension

» Mebendazole Oral Suspension is Mebendazole in an aqueous vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mebendazole (C₁₆H₁₃N₃O₃).

Packaging and storage—Preserve in tight containers at controlled room temperature.

Labeling—Label it to indicate that it is for veterinary use only.

USP Reference standards (11)—

USP Mebendazole RS

Identification—Mix a quantity of Oral Suspension, equivalent to about 200 mg of mebendazole, with 20 mL of a mixture of chloroform and 96 percent formic acid (19:1). Proceed as directed for Identification under Mebendazole Tablets, beginning with "Warm the suspension on a water bath for a few minutes." The specified result is obtained.

pH (791): between 6.0 and 7.0.

Assay—

Standard preparation—Transfer about 10 mg of USP Mebendazole RS, accurately weighed, to a 100-mL volumetric flask, and add 90 mL of chloroform, 7 mL of isopropyl alcohol, and 2 mL of 96 percent formic acid. Agitate until the solid has dissolved, add isopropyl alcohol to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with isopropyl alcohol to volume, and mix to obtain a solution having a known concentration of about 5 µg per mL.

Assay preparation 1—Transfer an accurately measured quantity of Oral Suspension, equivalent to about 1000 mg of mebendazole, to a 100-mL volumetric flask, dilute with 96 percent formic acid to volume, and mix. Transfer 10.0 mL of this mixture to a second 100-mL volumetric flask, add 40 mL of 96 percent formic acid, and heat in a water bath at a temperature of 50° for 15 minutes. Cool, add water to volume, mix, and pass through a medium-porosity, sintered-glass filter. Transfer 10.0 mL of the filtrate to a 250-mL separator, and add 50 mL of water and 50 mL of chloroform. Shake for about 2 minutes, allow the phases to separate, and transfer the chloroform layer to a second 250-mL separator. Wash the aqueous layer with two 10-mL portions of chloroform, add the chloroform washings to the second separator, and discard the aqueous layer. Wash the combined chloroform solutions with a mixture of 4 mL of 1 N hydrochloric acid and 50 mL of a 1 in 10 solution of 96 percent formic acid in water, and transfer the chloroform layer to a 100-mL volumetric flask. Extract the aqueous washing with two 10-mL portions of chloroform, add these chloroform extracts to the chloroform solution in the volumetric flask, add 2 mL of 96 percent formic acid and 7 mL of isopropyl alcohol, dilute with chloroform to volume, and mix. Transfer 5.0 mL of this solution to another 100-mL volumetric flask, dilute with isopropyl alcohol to volume, and mix.

Assay preparation 2 (where the Oral Suspension is packaged in syringes calibrated to deliver stated increments of mebendazole)—Express an increment of Oral Suspension to a volumetric flask of an appropriate nominal volume so that when diluted with 96 percent formic acid to volume a mixture containing about 10 mg of mebendazole per mL is obtained. Transfer 10.0 mL of this mixture to a 100-mL volumetric flask, add 40 mL of 96 percent formic acid, and heat in a water bath at a temperature of 50° for 15 minutes. Proceed as directed for Assay preparation 1 beginning with "Cool, add water to volume."

Procedure—Mix 90 mL of chloroform with 2 mL of 96 percent formic acid in a 100-mL volumetric flask, add isopropyl alcohol to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with isopropyl alcohol to volume, and mix to obtain a reagent blank. Concomitantly determine the absorbances of the relevant Assay preparation and the Standard preparation at the wavelength of maximum absorbance at about 247 nm with a spectrophotometer, using the reagent blank to set the instrument. Calculate the quantity, in mg, of mebendazole (C₁₆H₁₃N₃O₃) in the portion of Oral Suspension taken to prepare Assay preparation 1 by the formula:

$$200C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Mebendazole RS in the Standard preparation; and A_U and A_S are the absorbances of Assay preparation 1 and the Standard preparation, respectively. Where appropriate, calculate the quantity, in mg, of mebendazole (C₁₆H₁₃N₃O₃) in the incre-

ment of Oral Suspension taken to prepare Assay preparation 2 by the formula:

$$20,000(C/V)(A_U/A_S)$$

in which V is the volume, in mL, of the volumetric flask into which the increment of Oral Suspension was expressed; A_U is the absorbance of Assay preparation 2; and the other terms are as defined above.

Mebendazole Tablets

DEFINITION

Mebendazole Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of mebendazole ($C_{16}H_{13}N_3O_3$).

IDENTIFICATION

• A.

Standard solution: 10 mg/mL of USP Mebendazole RS in chloroform and 96% formic acid (19:1)

Sample solution: Finely powder a quantity of Tablets, equivalent to 200 mg of mebendazole, and mix the powder with 20 mL of a mixture of chloroform and 96% formic acid (19:1). Warm the suspension on a water bath for a few min. Cool, and pass through a medium-porosity, sintered-glass filter.

Chromatographic system

(See Chromatography <621>, Thin-Layer Chromatography.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μ L

Developing solvent system: Chloroform, methanol, and 96% formic acid (90:5:5)

Analysis

Samples: Standard solution and Sample solution

Apply the Samples to the plate, and allow the spots to dry. Develop the chromatogram in the Developing solvent system until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the Sample solution corresponds to that of the Standard solution.

ASSAY

• PROCEDURE

Solution A: 0.05 M monobasic potassium phosphate

Mobile phase: Methanol and Solution A (60:40). Adjust with 0.1 M phosphoric acid or 1 N sodium hydroxide to a pH of 5.5, and filter.

Standard stock solution: 0.25 mg/mL of USP Mebendazole RS prepared as follows. Transfer 25 mg of USP Mebendazole RS into a 100-mL volumetric flask. Add 10 mL of formic acid, and heat in a water bath at 50° for 15 min. Shake by mechanical means for 5 min, add 90 mL of methanol, and allow to cool. Dilute with methanol to volume.

Standard solution: 0.05 mg/mL of USP Mebendazole RS in Mobile phase from the Standard stock solution

Sample stock solution: Nominally 0.25 mg/mL of mebendazole prepared as follows. Transfer an equivalent to 500 mg of mebendazole, from finely powdered Tablets (NLT 20), to a 100-mL volumetric flask. Add 50 mL of formic acid, and heat in a water bath at 50° for 15 min. Shake by mechanical means for 1 h, dilute with water to volume, mix, and filter. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask, and dilute with a solution of formic acid in methanol (1:9) to volume.

Sample solution: Nominally 0.05 mg/mL of mebendazole in Mobile phase from the Sample stock solution. Pass the solution through a suitable filter of 0.5- μ m pore size.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 247 nm

Columns

Precolumn: Contains packing L1

Analytical column: 3.9-mm \times 30-cm; packing L1

Column temperature: 30°

Flow rate: 1.5 mL/min

Injection volume: 15 μ L

System suitability

Sample: Standard solution

Relative standard deviation: NMT 1%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of mebendazole ($C_{16}H_{13}N_3O_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of mebendazole from the Sample solution

r_S = peak response of mebendazole from the Standard solution

C_S = concentration of USP Mebendazole RS in the Standard solution (mg/mL)

C_U = nominal concentration of mebendazole in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid containing 1.0% sodium lauryl sulfate; 900 mL

Apparatus 2: 75 rpm

Time: 120 min

Solution A: Dissolve 8.0 g of sodium hydroxide in 2 L of water. Add 3.0 g of sodium lauryl sulfate, and mix. Add 20 mL of phosphoric acid, and adjust with phosphoric acid to a pH of 2.5.

Mobile phase: Acetonitrile and Solution A (3:7)

Standard solution: 0.5 mg/mL of USP Mebendazole RS prepared as follows. Transfer the appropriate amount of USP Mebendazole RS to a volumetric flask. Add 20% of the final volume of formic acid, and dissolve. Dilute with methanol to volume. Dilute a portion of this solution with Medium to obtain a solution having a known concentration similar to the expected concentration in the solution under test.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 3-cm; packing L7

Flow rate: 1 mL/min

Injection volume: 10 μ L

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis: Determine the percentage of mebendazole ($C_{16}H_{13}N_3O_3$) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of mebendazole ($C_{16}H_{13}N_3O_3$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Standard stock solution: Transfer 20 mg of USP Mebendazole RS into a 10-mL volumetric flask. Add 4 mL

of 96% formic acid, and mix to dissolve. Add isopropyl alcohol to volume.

Standard solution: 0.01 mg/mL of USP Mebendazole RS in isopropyl alcohol, from the *Standard stock solution*

Sample solution: Mix 1 Tablet with 20 mL of 96% formic acid in a 100-mL volumetric flask, and heat on a steam bath for 15 min. Cool, add isopropyl alcohol to volume, mix, and pass through a medium pore size, sintered-glass filter. Transfer an equivalent to 1 mg of mebendazole from the filtrate to a 100-mL volumetric flask, and dilute with isopropyl alcohol to volume.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Absorption maximum at about 310 nm

Cell length: 1 cm

Blank: 1-in-500 solution of 96% formic acid in isopropyl alcohol

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the quantity, in mg, of mebendazole ($C_{16}H_{13}N_3O_3$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times L \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Mebendazole RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mebendazole in the *Sample solution* (mg/mL)

L = label claim (mg/Tablet)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Mebendazole RS

Mebrofenin

$C_{15}H_{19}BrN_2O_5$ 387.23

Glycine, *N*-[2-[(3-bromo-2,4,6-trimethylphenyl)amino]-2-oxoethyl]-*N*-(carboxymethyl)-;

[[[(3-Bromomesityl)carbonyl]methyl]imino]diacetic acid [78266-06-5].

DEFINITION

Mebrofenin contains NLT 97.0% and NMT 101.0% of mebrofenin ($C_{15}H_{19}BrN_2O_5$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY

- **PROCEDURE**

Sample solution: Dissolve 100 mg of Mebrofenin in 40 mL of dimethylformamide in a conical flask with the aid of sonication if necessary. Add 3 drops of thymol blue TS.

Analysis: Titrate the *Sample solution* with 0.1 N sodium methoxide (in toluene) VS to a blue endpoint while flushing the flask with a gentle stream of nitrogen. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium methoxide is equivalent to 19.36 mg of mebrofenin ($C_{15}H_{19}BrN_2O_5$).

Acceptance criteria: 97.0%–101.0% on the dried basis

- **USP REFERENCE STANDARDS (11)**
USP Mebrofenin RS

Mecamylamine Hydrochloride $\text{C}_{11}\text{H}_{21}\text{N} \cdot \text{HCl}$ 203.75Bicyclo[2.2.1]heptan-2-amine, *N*,2,3,3-tetramethyl-, hydrochloride.*N*,2,3,3-Tetramethyl-2-norbornanamine hydrochloride [826-39-1].

» Mecamylamine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of $\text{C}_{11}\text{H}_{21}\text{N} \cdot \text{HCl}$, calculated on the dried basis.

Packaging and storage—Preserve in tight containers.**USP Reference standards (11)**—

USP Mecamylamine Hydrochloride RS

USP Mecamylamine Related Compound A RS

N,1,7,7-Tetramethyl bicyclo [2.2.1]heptan-2-amine. $\text{C}_{11}\text{H}_{21}\text{N}$ 167.29**Identification—****A:** *Infrared Absorption* (197K).**B:** It responds to the tests for *Chloride* (191).

Acidity—Dissolve 5.0 g in 100 mL of methanol, and titrate potentiometrically with 0.10 N alcoholic potassium hydroxide to an apparent pH of 5.5, using a calomel-glass electrode system and a potentiometer previously standardized with pH 5.0 neutralized phthalate buffer (see *Solutions* in the section *Reagents, Indicators, and Solutions*): after correction for the volume of alkali consumed by 100 mL of methanol, not more than 0.55 mL of 0.10 N alcoholic potassium hydroxide is required.

Loss on drying (731)—Dry it at a pressure not exceeding 5 mm of mercury at 105° for 1 hour: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.5%.**Delete the following:**

• **Heavy metals, Method I (231)**—Dissolve 400 mg in 20 mL of water, add 2 mL of 1 N acetic acid, and dilute with water to 25 mL: the limit is not more than 50 ppm.

(Official 1-Jan-2018)

Limit of residual solvents—**Diluent**—Prepare a mixture of dimethyl sulfoxide and water (2:1).**Internal standard solution**—Prepare a solution of absolute alcohol in *Diluent* having a known concentration of about 15 µL per mL.**Standard stock solution**—Transfer 50 mL of the *Diluent* to a 100-mL volumetric flask, add 0.64 mL of isopropyl alcohol, dilute with *Diluent* to volume, and mix.**Standard solution**—Pipet 1.0 mL of the *Standard stock solution* into a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix (*Solution 1*). Transfer about 500 mg of sodium chloride, accurately weighed, to a headspace vial, add 1.5 mL of *Solution 1* and 1.5 mL of the *Internal standard solution*, and mix.**Test solution**—Transfer about 150 mg of Mecamylamine Hydrochloride, accurately weighed, to a headspace vial, add about 500 mg of sodium chloride, 1.5 mL of *Diluent*, and 1.5 mL of the *Internal standard solution*, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column whose internal wall is coated with a 1.0-µm film of liquid phase G16. This column is joined with a 0.53-mm × 25-m capillary column whose internal wall is coated with a 5.0-µm film of liquid phase G1. The G16 column is connected to the detector, and the G1 column is connected to the injector. The injection port temperature is maintained at about 100°; the detector temperature is maintained at about 210°; and the column temperature is maintained at 50° for 10 minutes, then increased at a rate of 5° per minute to 110°, then increased at a rate of 30° per minute to 210°, and maintained for 5 minutes at 210°. Nitrogen is used as the carrier gas, flowing at a rate of about 6.5 mL per minute. The split flow is 15 mL per minute.

Procedure—Allow the *Standard solution*, the *Internal standard solution*, and the *Test solution* to stand for 20 minutes at 90°. Separately inject equal volumes (about 1 mL) of the headspace of the *Standard solution*, the *Internal standard solution*, and the *Test solution* into the gas chromatograph, record the chromatograms, and measure the peak responses of the internal standard and isopropyl alcohol. Calculate the

quantity, in ppm, of isopropyl alcohol in the portion of Mecamylamine Hydrochloride taken by the formula:

$$150(R_U)(W_S) / (R_S)(W_U)$$

in which W_S is the amount, in ppm, of isopropyl alcohol in the *Standard solution*; W_U is the weight, in mg, of Mecamylamine Hydrochloride taken to prepare the *Test solution*; and R_U and R_S are the peak response ratios of isopropyl alcohol to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively: not more than 2000 ppm of isopropyl alcohol is found.

Related compounds—

Internal standard solution—Proceed as directed in the *Assay*.

Solution 1—Prepare a solution of *dl*-camphene and USP Mecamylamine Related Compound A RS in the *Internal standard solution* containing 625 µg of each per mL.

System suitability solution—Transfer about 125 mg of USP Mecamylamine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 1 mL of *Solution 1*, dilute with *Internal standard solution* to volume, and mix.

Test solution—Use the *Assay preparation*.

Chromatographic system—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record peak responses as directed for *Procedure*: the resolution, R , between the mecamlamine and mecamlamine related compound A is not less than 5; the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject a volume (about 1 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all the peak responses. Calculate the percentage of each impurity in the portion of Mecamylamine Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which r_i is the peak response for each impurity; and r_s is the sum of the responses for all the peaks: not more than 0.5% of mecamlamine related compound A is found; not more than 0.5% of *dl*-camphene is found; and not more than 1.0% of total impurities is found.

Chloride content—Dissolve about 500 mg, accurately weighed, in 5 mL of water. Add 5 mL of glacial acetic acid, 50 mL of methanol, and 1 drop of eosin Y TS, and titrate with 0.1 N silver nitrate VS. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl: the content is between 17.0% and 17.8%.

Assay—

Internal standard solution—Transfer about 600 mg of sodium hydroxide pellets to a 1 L volumetric flask, dissolve in about 800 mL of methanol. Add an accurately weighed quantity of about 1.7 g of biphenyl to the flask, and dilute with methanol to volume.

Standard preparation—Dissolve an accurately weighed quantity of USP Mecamylamine Hydrochloride RS in *Internal standard solution*, and dilute with *Internal standard solution*, quantitatively and stepwise if necessary, to obtain a solution having a known concentration of about 2.5 mg per mL.

Assay preparation—Transfer about 125 mg of Mecamylamine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Internal standard solution* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector connected to a 0.53-mm × 30-m capillary column, coated with a 1.5-µm film of liquid phase G27. The injection port temperature is maintained at about 200°, the detector temperature is maintained at about 280°, and the column temperature is at 120° for 15 minutes then in-

creased at 25° per minute to 250° and maintained for 7 minutes at 250°. Nitrogen is used as the carrier gas at 7.4 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 4000 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Inject equal volumes (about 1 µL) of the *Assay preparation* and the *Standard preparation* into the gas chromatograph, record the chromatogram, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{11}H_{21}N \cdot HCl$ in the portion of Mecamylamine Hydrochloride taken by the formula:

$$50C(R_U / R_S)$$

in which C is the concentration of USP Mecamylamine Hydrochloride RS, in mg per mL, in the *Standard preparation*; and R_U and R_S are the peak response ratios of mecamlamine hydrochloride to the internal standard biphenyl obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mecamylamine Hydrochloride Tablets

» Mecamylamine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mecamlamine hydrochloride ($C_{11}H_{21}N \cdot HCl$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Mecamylamine Hydrochloride RS

Identification—

A: To a quantity of powdered Tablets, equivalent to about 75 mg of mecamlamine hydrochloride, add 50 mL of chloroform, and triturate the mixture for 5 minutes. Filter, and evaporate the filtrate on a steam bath with the aid of a current of air to dryness: the IR absorption spectrum of a potassium bromide dispersion of a portion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Mecamylamine Hydrochloride RS.

B: A portion of the residue obtained in *Identification test A* responds to the tests for *Chloride* (191).

Dissolution (711)—

Medium: water; 750 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{11}H_{21}N \cdot HCl$ dissolved using the following procedure.

Diluent—Prepare a solution of triethylamine in alcohol (1:100).

Internal standard solution—Prepare a solution of biphenyl in *Diluent* having a concentration of 82.5 µg per mL.

Standard solution—Prepare a solution of USP Mecamylamine Hydrochloride RS and biphenyl in *Diluent* having concentrations of 8.25 µg per mL of each.

Test solution—[NOTE—Condition the solid-phase extraction column specified in this procedure in the following manner. Wash the column with 5 mL of water, then with 5 mL of *Diluent*, and finally with two 5-mL portions of water.] Transfer by pipetting 25.0 mL of the solution under test through a freshly conditioned solid-phase extraction column containing L1 packing with a sorbent-mass to column volume ratio of 360 mg per 5 mL, or equivalent. Wash the pipet and the

solid-phase extraction column with two 5-mL portions of water. Discard the filtrate. Elute the solid-phase extraction column with two 4-mL portions of *Diluent*, and collect the eluate in a 10-mL volumetric flask containing 1.0 mL of *Internal standard solution*. Dilute with *Diluent* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector, a splitless injection system, and a 0.53-mm × 30-m analytical column coated with a 1.5-μm layer of phase G27. The carrier gas is helium at a flow rate of 5.2 mL per minute. The detector and column temperatures are maintained at 250° and 150°, respectively. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 4000 theoretical plates, the tailing factor is not more than 2, and the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount in mg, of $C_{11}H_{21}N \cdot HCl$ dissolved by the formula:

$$0.3C(R_U / R_S)$$

in which *C* is the concentration, in μg per mL, of USP Mecamylamine Hydrochloride RS in the *Standard solution*; and R_U and R_S are the peak response ratios of the mecamlamine hydrochloride peak to the internal standard peak obtained from the *Test solution* and *Standard solution*, respectively.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{11}H_{21}N \cdot HCl$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Place 1 Tablet in the digestion flask, and proceed as directed under *Nitrogen Determination, Method II* (461). Each mL of 0.01 N sulfuric acid is equivalent to 2.038 mg of mecamlamine hydrochloride.

Assay—Weigh and finely powder not fewer than 30 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of mecamlamine hydrochloride, to a glass-stoppered, 125-mL conical flask. Add about 25 mL of water, insert the stopper in the flask, and shake by mechanical means for 20 minutes. Transfer the contents of the flask to a 250-mL separator with the aid of small portions of water. Add 1 mL of 1 N sodium hydroxide and 5 g of sodium chloride, and extract the mixture successively with two 50-mL and three 25-mL portions of ether. Wash the combined ether extracts with three 10-mL portions of water, and wash, in turn, the combined water washes with a 10-mL portion of ether, adding it to the washed combined ether extracts. Transfer the ether phase to a 250-mL conical flask containing 25.0 mL of 0.02 N sulfuric acid VS, and evaporate the ether on a steam bath. Cool the solution, add methyl red TS, and titrate the excess acid with 0.02 N sodium hydroxide VS. Each mL of 0.02 N sulfuric acid is equivalent to 4.075 mg of mecamlamine hydrochloride ($C_{11}H_{21}N \cdot HCl$).

Mechlorethamine Hydrochloride

$C_5H_{11}Cl_2N \cdot HCl$ 192.51

Ethanamine, 2-chloro-*N*-(2-chloroethyl)-*N*-methyl-, hydrochloride.

2,2'-Dichloro-*N*-methyldiethylamine hydrochloride [55-86-7].

» Mechlorethamine Hydrochloride contains not less than 97.5 percent and not more than 100.5 percent of $C_5H_{11}Cl_2N \cdot HCl$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—The label bears a warning that great care should be taken to prevent inhaling particles of Mechlorethamine Hydrochloride and exposing the skin to it.

USP Reference standards (11)—

USP Mechlorethamine Hydrochloride RS

Identification—

A: Infrared Absorption (197K).

B: Transfer 100 mg to a test tube containing 1 mL of sodium thiosulfate solution (prepared by dissolving 1 g of sodium thiosulfate and 100 mg of sodium carbonate in 40 mL of water), shake, allow to stand for 2 hours, then add 1 drop of iodine TS: the color of free iodine remains.

Melting range (741): between 108° and 111°.

pH (791): between 3.0 and 5.0, in a solution (1 in 500).

Water Determination, Method I (921): not more than 0.4%.

Ionic chloride content—Dissolve about 30 mg, accurately weighed, in 30 mL of water contained in a beaker. Add 5 mL of nitric acid and stir. Titrate with 0.02 N silver nitrate VS to a potentiometric endpoint, using a silver combination electrode. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.02 N silver nitrate is equivalent to 0.709 mg of ionic chloride: not less than 18.0% and not more than 19.3% of ionic chloride is found.

Assay—Transfer about 100 mg of Mechlorethamine Hydrochloride, accurately weighed, to a 125-mL conical flask. Add 100 mg of sodium bicarbonate and 20.0 mL of 0.1 N sodium thiosulfate VS. Allow to stand for 2½ hours, add 3 mL of starch TS, and titrate the excess sodium thiosulfate with 0.1 N iodine VS. Each mL of 0.1 N sodium thiosulfate is equivalent to 9.626 mg of $C_5H_{11}Cl_2N \cdot HCl$.

Mechlorethamine Hydrochloride for Injection

» Mechlorethamine Hydrochloride for Injection is a sterile mixture of Mechlorethamine Hydrochloride with Sodium Chloride or other suitable diluent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mechlorethamine hydrochloride ($C_5H_{11}Cl_2N \cdot HCl$).

Change to read:

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017).

Labeling—It meets the requirements for *Labeling* (7), *Labels and Labeling for Injectable Products*. The label bears a warning that great care should be taken to prevent inhaling particles of Mechlorethamine Hydrochloride for Injection and exposing the skin to it.

USP Reference standards (11)—

USP Endotoxin RS

USP Mechlorethamine Hydrochloride RS

Completeness of solution (641)—A 0.10-g portion dissolves in 10 mL of carbon dioxide-free water to yield a clear solution.

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests*, *Completeness and clarity of solutions*.

Identification—It meets the requirements of the *Identification tests* under *Mechlorethamine Hydrochloride*.

Bacterial Endotoxins Test (85)—It contains not more than 12.5 USP Endotoxin Units per mg of mechlorethamine hydrochloride.

pH (791): between 3.0 and 5.0, in a solution (1 in 50).

Water Determination, Method I (921): not more than 1.0%.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements for *Sterility Tests* (71) and *Uniformity of Dosage Units* (905).

Assay—

Assay preparation—Select a counted number of not fewer than 10 containers of Mechlorethamine Hydrochloride for Injection, equivalent to about 100 mg of mechlorethamine hydrochloride. Dissolve the contents of each container in water, and transfer the resulting solutions to a 250-mL conical flask.

Procedure—Immediately proceed as directed in the *Assay* under *Mechlorethamine Hydrochloride*, beginning with "Add 100 mg of sodium bicarbonate." Calculate the average content, in mg, of mechlorethamine hydrochloride ($C_5H_{11}Cl_2N \cdot HCl$) per container of Mechlorethamine Hydrochloride for Injection taken by the formula:

$$9.626(V/N)$$

in which *V* is the volume, in mL, of 0.1 N sodium thiosulfate consumed; and *N* is the number of containers selected to prepare the *Assay preparation*.

Meclizine Hydrochloride

$C_{25}H_{27}ClN_2 \cdot 2HCl \cdot H_2O$ 481.89

$C_{25}H_{27}ClN_2 \cdot 2HCl$ 463.88

Piperazine, 1-[(4-chlorophenyl)phenylmethyl]-4-[(3-methylphenyl)methyl]-, dihydrochloride, monohydrate; 1-(*p*-chloro- α -phenylbenzyl)-4-(*m*-methylbenzyl)piperazine dihydrochloride monohydrate [31884-77-2].

Anhydrous [1104-22-9].

DEFINITION

Meclizine Hydrochloride contains NLT 97.0% and NMT 102.0% of $C_{25}H_{27}ClN_2 \cdot 2HCl$, calculated on the anhydrous basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

Sample solution: Dissolve 25 mg in a mixture of 3 mL of 2 N nitric acid and 5 mL of alcohol.

Acceptance criteria: Meets the requirements

ASSAY• **PROCEDURE**

Mobile phase: Dissolve 1.5 g of sodium 1-heptanesulfonate in 300 mL of water, and mix this solution with 700 mL of acetonitrile. Adjust with 0.1 N sulfuric acid to a pH of 4.

Standard solution: 0.1 mg/mL of USP Meclizine Hydrochloride RS in *Mobile phase*

Sample solution: 0.1 mg/mL of Meclizine Hydrochloride in *Mobile phase*

• **Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.3 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 1.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of meclizine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$) in the portion of Meclizine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of meclizine from the *Sample solution*

r_S = peak response of meclizine from the *Standard solution*

C_S = concentration of USP Meclizine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Meclizine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–102.0% on the anhydrous basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **ORGANIC IMPURITIES, PROCEDURE 1**

[NOTE—On the basis of the synthetic route, perform either *Procedure 1* or *Procedure 2*. *Procedure 2* is recommended when the isomeclizine impurity may be present.]

Mobile phase: Dissolve 1.5 g of sodium 1-heptanesulfonate in 300 mL of water, and mix this solution with 700 mL of acetonitrile. Adjust with 0.1 N sulfuric acid to a pH of 4.

System suitability solution: 0.01 mg/mL each of USP Meclizine Hydrochloride RS and 4-chlorobenzophenone in *Mobile phase*

Standard solution: 2.5 μ g/mL of USP Meclizine Hydrochloride RS in *Mobile phase*

Sample solution: 0.5 mg/mL of Meclizine Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.3 mL/min

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The elution order is meclizine, followed by 4-chlorobenzophenone.]

Suitability requirements

Resolution: NLT 2.0 between meclizine hydrochloride and 4-chlorobenzophenone, *System suitability solution*

Column efficiency: NLT 1800 theoretical plates, determined from the analyte peak, *Standard solution*
 Tailing factor: NMT 1.5 for the analyte peak, *Standard solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Allow the *Sample solution* to elute for NLT three times the retention time of meclizine hydrochloride.

Calculate the percentage of each impurity in the portion of Meclizine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of meclizine from the *Standard solution*

C_S = concentration of USP Meclizine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Meclizine Hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor, 0.72 for the 4-chlorobenzophenone peak and 1.0 for all other peaks

Acceptance criteria

Any individual impurity: NMT 0.5%

Total impurities: NMT 1.0%

• ORGANIC IMPURITIES, PROCEDURE 2

Mobile phase: Dissolve 5 g of sodium 1-heptanesulfonate in 1000 mL of water, and mix 600 mL of this solution with 400 mL of acetonitrile. Adjust with 0.1 N sulfuric acid to a pH of 4.0 ± 0.1 .

System suitability solution: 2.5 µg/mL each of USP Meclizine Hydrochloride RS, USP Meclizine Related Compound A RS, and USP Meclizine Related Compound B RS in *Mobile phase*

Standard solution: 2.5 µg/mL of USP Meclizine Hydrochloride RS in *Mobile phase*

Sample solution: 0.5 mg/mL of Meclizine Hydrochloride in *Mobile phase*. [NOTE—Store this solution no longer than 24 h.]

Chromatographic system

^c USP Meclizine Related Compound B.

SPECIFIC TESTS

• **WATER DETERMINATION, Method I (921):** NMT 5.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers. Store at room temperature.

• **LABELING:** If a test for *Organic Impurities* other than *Procedure 1* is used, the labeling states the test with which the article complies.

• **USP REFERENCE STANDARDS (11)**

USP Meclizine Hydrochloride RS

USP Meclizine Related Compound A RS

4-Chlorobenzhydrol.

$C_{13}H_{11}ClO$ 218.68

USP Meclizine Related Compound B RS

Isomeclizine

1-[(4-Chlorophenyl)(phenyl)methyl]-

4-(2-methylbenzyl)piperazine dihydrochloride monohydrate.

$C_{25}H_{27}ClN_2 \cdot 2HCl \cdot H_2O$ 481.88

Meclizine Hydrochloride Tablets

» Meclizine Hydrochloride Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of meclizine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Meclizine Hydrochloride RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Thin-Layer Chromatographic Identification Test (201)—

Adsorbent: 0.5-mm layer of chromatographic silica gel mixture.

Test solution—Extract a quantity of finely powdered Tablets, equivalent to about 125 mg of meclizine hydrochloride, by shaking for 15 minutes with 50 mL of methanol.

Standard solution—Prepare a solution of USP Meclizine Hydrochloride RS in methanol, containing 2.5 mg per mL.

Application volume: 50 μ L.

Developing solvent system: a mixture of cyclohexane, toluene, and diethylamine (15:3:2).

Procedure—Proceed as directed in the chapter, except to place the plate in a developing chamber that contains and has been equilibrated with *Developing solvent system*.

Dissolution, Procedure for a Pooled Sample (711)—

Medium: 0.01 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Determine the amount of $C_{25}H_{27}ClN_2 \cdot 2HCl$ dissolved by employing the following method.

Mobile phase—Prepare a suitable degassed and filtered mixture of water and methanol (55:45) that contains 0.69 g of monobasic sodium phosphate in each 100 mL and is adjusted with phosphoric acid, if necessary, to a pH of 4.0.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 230-nm detector and a 4.6-mm \times 25-cm analytical column that contains packing L9. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Inject about 100 μ L of a filtered portion of the solution under test, suitably diluted with *Mobile phase*, if necessary, into the chromatograph, record the chromatogram, and measure the response for the major peak. Determine the amount of $C_{25}H_{27}ClN_2 \cdot 2HCl$ dissolved from the peak response obtained in comparison with the peak response obtained from a Standard solution having a known concentration of USP Meclizine Hydrochloride RS in a mixture of *Medium* and *Mobile phase* (1:1), similarly chromatographed. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to dissolve USP Meclizine Hydrochloride RS prior to dilution.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{25}H_{27}ClN_2 \cdot 2HCl$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Place 1 Tablet in a 100-mL volumetric flask, add 50 mL of dilute hydrochloric acid (1 in 100), shake by mechanical means for 30 minutes, add the dilute acid to volume, and filter, discarding the first 20 mL of the filtrate. Dilute quantitatively and stepwise with the same acid to obtain a solution having a concentration of about 15 μ g of meclizine hydrochloride per mL. Similarly, prepare a Standard solution of USP Meclizine Hydrochloride RS in dilute hydrochloric acid (1 in 100) having a known concentration of about 15 μ g per mL. Concomitantly determine the absorbances of the solution from the Tablet and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 232 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 100) as the blank. Calculate the quantity, in mg, of meclizine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$) in the Tablet taken by the formula:

$$(T/D)C(A_U/A_S)$$

in which *T* is the quantity, in mg, of meclizine hydrochloride in the Tablet; *D* is the concentration, in μ g per mL, of meclizine hydrochloride in the solution from the Tablet, on the basis of the labeled quantity per Tablet and the extent

of dilution; *C* is the concentration, in μ g per mL, of USP Meclizine Hydrochloride RS in the Standard solution; and *A_U* and *A_S* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Related compounds—

Mobile phase and Buffer pH 7.5—Prepare as directed in the Assay.

Standard solution—Dissolve an accurately weighed quantity of USP Meclizine Hydrochloride RS in *Mobile phase*, sonicating for about 5 minutes or until the material is dissolved, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.025 mg per mL. [NOTE—This solution is stable for 72 hours when stored at controlled room temperature protected from light.]

Sensitivity solution—Dilute an aliquot of the *Standard solution* with *Diluent* to obtain a solution containing about 1.25 μ g per mL. [NOTE—Prepare this solution fresh daily.]

Test solution—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 250 mg of meclizine hydrochloride based on the label claim, to a 100-mL volumetric flask. Add about 50 mL of *Mobile phase* and shake by mechanical means for not less than 30 minutes. Dilute with *Mobile phase* to volume, mix, allow to settle for about 15 minutes, and pass through a 0.45- μ m nylon filter, discarding the first 5 mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—Prepare as directed in the Assay. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency, *N*, is not less than 1200 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%. Chromatograph the *Sensitivity solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio, *S/N*, is not less than 10.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard solution* and the *Test solution* into the chromatograph. Allow the *Test solution* to elute for not less than two times the retention time of meclizine hydrochloride. Record the chromatograms and measure all of the peak areas. Calculate the percentage of each impurity relative to the labeled content of meclizine hydrochloride in the portion of the Tablets taken by the formula:

$$100(1/F)(C_S/C_T)(r_i/r_S)$$

in which *F* is the relative response factor, which is equal to 0.72 for the 4-chlorobenzophenone peak eluting at a relative retention time of about 0.23 and equal to 1.0 for all other peaks; *C_T* is the concentration, in mg per mL, of meclizine hydrochloride in the *Test solution*, based on the label claim; *C_S* is the concentration, in mg per mL, of meclizine hydrochloride in the *Standard solution*; *r_i* is the peak response for each impurity obtained from the *Test solution*; and *r_S* is the response of the meclizine peak obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found; and not more than 1.0% of total impurities is found. Reporting level for impurities is 0.1%.

Assay—

Buffer pH 7.5—Dissolve 1.32 g of dibasic ammonium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of 7.5 \pm 0.05.

Mobile phase—Prepare a mixture of *Buffer pH 7.5*, methanol, and acetonitrile (350:325:325). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Meclizine Hydrochloride RS in *Mobile phase*, sonicating for about 5 minutes or until the material is dissolved, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known con-

centration of about 0.125 mg per mL. [NOTE—This solution is stable for 72 hours when stored at controlled room temperature protected from light.]

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 12.5 mg of mecizine hydrochloride based on the label claim, to a 100-mL volumetric flask. Add about 50 mL of *Mobile phase*, and shake by mechanical means for not less than 30 minutes. Dilute with *Mobile phase* to volume, mix, and filter through a 0.45- μ m nylon filter, discarding the first 5 mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 4.6-mm \times 25-cm column that contains 5- μ m packing L11. The column temperature is maintained at 30°, and the flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of the labeled amount of mecizine hydrochloride ($C_{25}H_{27}ClN_2 \cdot 2HCl$) in each Tablet taken by the formula:

$$100(CV/W)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of mecizine hydrochloride in the *Standard preparation*; V is the volume, in mL, of the *Assay preparation*; W is the quantity, in mg, of mecizine hydrochloride based on the label claim, taken to prepare the *Assay preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Meclocycline Sulfosalicylate

$C_{22}H_{21}ClN_2O_8 \cdot C_7H_6O_6S$ 695.05
2-Naphthacenecarboxamide, 7-chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-, [4S-(4 α ,4a α ,5 α ,5a α ,12a α)]-, mono(2-hydroxy-5-sulfobenzoate) (salt).
(4S,4aR,5S,5aR,12aS)-7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-2-naphthacene carboxamide mono(5-sulfosalicylate) (salt) [73816-42-9].

» Meclocycline Sulfosalicylate has a potency equivalent to not less than 620 μ g of meclocycline ($C_{22}H_{21}ClN_2O_8$) per mg.

Packaging and storage—Preserve in tight containers, protected from light.

USP Reference standards (11)—

USP Meclocycline Sulfosalicylate RS

Identification, Infrared Absorption (197K).

Crystallinity (695): meets the requirements.

pH (791): between 2.5 and 3.5, in a solution containing 10 mg per mL.

Water Determination, Method I (921): not more than 4.0%.

Assay—

0.001 M Ammonium edetate—Transfer 293 mg of edetic acid, accurately weighed, to a 1000-mL volumetric flask, add 1 mL of methanol and 7 mL of ammonium hydroxide, and shake to dissolve the edetic acid. Add 900 mL of water, adjust with glacial acetic acid to a pH of 6.6, dilute with water to volume, and mix.

Mobile phase—Prepare a mixture of 0.001 M Ammonium edetate and tetrahydrofuran (85 : 15). Filter and degas the solution before use.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Meclocycline Sulfosalicylate RS in methanol to obtain a solution having a known concentration of about 0.5 mg of meclocycline per mL.

Standard preparation—Immediately prior to injection, dilute the *Standard stock preparation* quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 60 μ g of meclocycline per mL.

Assay stock preparation—Transfer 36 mg of Meclocycline Sulfosalicylate, accurately weighed, to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

Assay preparation—Immediately prior to injection, transfer 3.0 mL of the *Assay stock preparation* to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a nominal concentration of about 60 μ g of meclocycline per mL.

Chromatographic system—The liquid chromatograph is equipped with a 340-nm detector and a 4-mm \times 25-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation of the meclocycline peak for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and measure the responses for the meclocycline peak. Calculate the quantity in μ g of $C_{22}H_{21}ClN_2O_8$ in each mg of Meclocycline Sulfosalicylate taken by the formula:

$$(C_S / C_U)(r_U / r_S)$$

in which C_S is the concentration, in μ g per mL, of meclocycline in the *Standard preparation*; C_U is the concentration, in mg per mL, of Meclocycline Sulfosalicylate in the *Assay preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Meclocycline Sulfosalicylate Cream

» Meclocycline Sulfosalicylate Cream contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of meclocycline ($C_{22}H_{21}ClN_2O_8$).

Packaging and storage—Preserve in tight containers, protected from light.

USP Reference standards (11)—

USP Meclocycline Sulfosalicylate RS

Minimum fill (755): meets the requirements.

Assay—

0.001 M Ammonium edetate—Transfer 293 mg of edetic acid, accurately weighed, to a 1000-mL volumetric flask, add 1 mL of methanol and 7 mL of ammonium hydroxide, and shake to dissolve the edetic acid. Add 900 mL of water,

adjust with glacial acetic acid to a pH of 6.6, dilute with water to volume, and mix.

Mobile phase—Prepare a mixture of 0.001 M Ammonium edetate and tetrahydrofuran (85 : 15). Filter and degas the solution before use.

Standard stock preparation—Dissolve an accurately weighed quantity of USP Meclocycline Sulfosalicylate RS in methanol to obtain a solution having a known concentration of about 0.5 mg of meclocycline per mL.

Standard preparation—Immediately prior to injection, dilute the *Standard stock preparation* quantitatively, and stepwise if necessary, with *Mobile phase*, to obtain a solution having a known concentration of about 10 µg of meclocycline per mL.

Assay stock preparation—Transfer an accurately weighed quantity of Cream, equivalent to about 5 mg of meclocycline, to a glass-stoppered, 50-mL centrifuge tube. Add 20 mL of methanol and 20 mL of 0.025 N sulfuric acid, and shake vigorously for 15 minutes. Transfer the solution to a 50-mL volumetric flask, rinse the centrifuge tube with two 5-mL portions of methanol, and add the rinsings to the flask. Dilute with methanol to volume, and mix.

Assay preparation—Centrifuge a portion of the *Assay stock preparation* for 5 minutes. Immediately prior to injection, transfer 5 mL of the supernatant to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter to obtain a solution having a nominal concentration of about 10 µg of meclocycline per mL.

Chromatographic system—The liquid chromatograph is equipped with a 340-nm detector and a 4-mm × 25-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation of the meclocycline peak for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the meclocycline peak. Calculate the percent label claim of C₂₂H₂₁ClN₂O₈ in the portion of Cream taken by the formula:

$$(C_s / C_u)(r_u / r_s)(100)$$

in which C_s is the concentration, in µg per mL, of meclocycline in the *Standard preparation*; C_u is the nominal concentration, in µg per mL, of meclocycline in the *Assay preparation*; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Meclofenamate Sodium

C₁₄H₁₀Cl₂NNaO₂ · H₂O 336.15

Benzoic acid, 2-[(2,6-dichloro-3-methylphenyl)amino]-, monosodium salt, monohydrate.

Monosodium *N*-(2,6-dichloro-*m*-tolyl)anthranilate monohydrate [6385-02-0].

Anhydrous 318.13

» Meclofenamate Sodium contains not less than 97.0 percent and not more than 103.0 percent of C₁₄H₁₀Cl₂NNaO₂, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—
USP Meclofenamate Sodium RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption 1 (197U)—

Solution: 25 µg per mL.

Medium: 0.01 N hydrochloric acid in methanol.

Absorptivities at 242 nm, 279 nm, and 336 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

C: Ultraviolet Absorption 2 (197U)—

Solution: 1 in 40,000.

Medium: 0.1 N sodium hydroxide.

Absorptivities at 279 nm and 317 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

Water Determination, Method I (921): between 4.8% and 5.8%.

Copper—

Standard copper solution—Dissolve 1000 mg of copper wire in 6 mL of nitric acid in a 1 L volumetric flask. Add 8 mL of hydrochloric acid, dilute with water to volume, and mix. Dilute this solution quantitatively and stepwise with water to obtain a *Standard copper solution* having a known concentration of 0.6 µg per mL.

Test solution—Transfer 2 g of Meclofenamate Sodium, accurately weighed, to a 100-mL volumetric flask, and add 1 drop of ammonium hydroxide. Dissolve in water, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the *Standard copper solution* and the *Test solution* at the copper emission line at about 325 nm, with a suitable atomic absorption spectrophotometer (see *Atomic Absorption Spectroscopy* (852)) equipped with a copper hollow-cathode lamp, using water as the blank. Adjust the operating conditions to obtain about 70% full-scale detector response with the *Standard copper solution*. The detector response obtained with the *Test solution* is not greater than that obtained with the *Standard copper solution* (0.003%).

Chromatographic purity—

Standard solutions—Dissolve an accurately weighed quantity of USP Meclofenamate Sodium RS in methanol to obtain a solution containing 20 mg per mL (*Standard solution A*). Dilute 1.0 mL of *Standard solution A* with sufficient methanol to obtain 200 mL of solution (*Standard solution B*).

Test solution—Dissolve 200 mg of Meclofenamate Sodium in 10.0 mL of methanol.

Procedure—Apply 10-µL portions of *Standard solution A*, *Standard solution B*, and the *Test solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride, methyl ethyl ketone, and glacial acetic acid (50:48:2) until the solvent front has moved about eight-tenths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wave-length UV light: the chromatograms show a principal spot at about the same R_f value, and any secondary spot, if present in the chromatogram from the *Test solution* is not more intense than the principal spot obtained from *Standard solution B* (0.5%).

Assay—Transfer about 350 mg of Meclofenamate Sodium, accurately weighed, to a 125-mL separator, add 10 mL of water, and mix to dissolve. To this solution add 3 mL of 3 N hydrochloric acid, shake, and extract with three 30-mL portions of chloroform, collecting the chloroform extracts in an evaporating flask. Evaporate the chloroform extracts to dry-

ness. Dissolve the residue in 5 mL of dimethyl sulfoxide and 25 mL of methanol. Mix, add 5 drops of phenolphthalein TS, and titrate the mixture with 0.1 N sodium hydroxide VS. Each mL of 0.1 N sodium hydroxide is equivalent to 31.81 mg of $C_{14}H_{10}Cl_2NNaO_2$.

Meclofenamate Sodium Capsules

» Meclofenamate Sodium Capsules contain an amount of $C_{14}H_{10}Cl_2NNaO_2$ equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of meclofenamic acid ($C_{14}H_{11}Cl_2NO_2$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Meclofenamate Sodium RS

Identification—Prepare a solution of Capsule contents in methanol containing 20 mg per mL, and filter. The clear filtrate so obtained meets the requirements of the *Thin-Layer Chromatographic Identification Test* (201), the solvent mixture consisting of methylene chloride, methyl ethyl ketone, and glacial acetic acid (50:48:2).

Dissolution (711)—

Medium: 0.05 M pH 7.5 phosphate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of meclofenamic acid ($C_{14}H_{11}Cl_2NO_2$) dissolved from UV absorbances at the wavelength of maximum absorbance at about 279 nm of filtered portions of the solution under test, suitably diluted with *Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Meclofenamate Sodium RS in the same *Medium*.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{14}H_{11}Cl_2NO_2$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 50 mg of meclofenamic acid, to a 200-mL volumetric flask. Add 0.01 N hydrochloric acid in methanol to volume, and mix. Filter, discarding the first 20 mL of the filtrate. Transfer 10.0 mL of the filtrate to a 100-mL volumetric flask, add 0.01 N hydrochloric acid in methanol to volume, and mix. Dissolve an accurately weighed quantity of USP Meclofenamate Sodium RS in 0.01 N hydrochloric acid in methanol to obtain a solution having a known concentration of about 27 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 336 nm, with a suitable spectrophotometer, using 0.01 N hydrochloric acid in methanol as the blank. Calculate the quantity, in mg, of meclofenamate acid ($C_{14}H_{11}Cl_2NO_2$) in the portion of Capsule contents taken by the formula:

$$2C(296.15 / 318.13)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Meclofenamate Sodium RS in the Standard solution; 296.15 and 318.13 are the molecular weights of meclofenamic acid and meclofenamate sodium, respectively; and A_U and A_S are

the absorbances of the solution from the Capsule contents and the Standard solution, respectively.

Medroxyprogesterone Acetate

$C_{24}H_{34}O_4$ 386.52
Pregn-4-ene-3,20-dione, 17-(acetyloxy)-6-methyl-, (6α)-;
17-Hydroxy-6α-methylpregn-4-ene-3,20-dione acetate
[71-58-9].

DEFINITION

Medroxyprogesterone Acetate contains NLT 97.0% and NMT 103.0% of medroxyprogesterone acetate ($C_{24}H_{34}O_4$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. ULTRAVIOLET ABSORPTION (197U)

Analytical wavelength: 241 nm

Sample solution: 10 µg/mL in alcohol

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 2.0%.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and water (40:60)

Standard solution: 1 mg/mL of USP Medroxyprogesterone Acetate RS in acetonitrile

Sample solution: 1 mg/mL of Medroxyprogesterone Acetate in acetonitrile

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: Standard solution

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of medroxyprogesterone acetate ($C_{24}H_{34}O_4$) in the portion of Medroxyprogesterone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the Sample solution

r_S = peak response from the Standard solution

C_S = concentration of USP Medroxyprogesterone Acetate RS in the Standard solution (mg/mL)

C_U = concentration of Medroxyprogesterone Acetate in the Sample solution (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase: Acetonitrile and water (60:40)

System suitability solution: 40 µg/mL each of megesterol acetate and USP Medroxyprogesterone Acetate RS in Mobile phase

Standard solution: 50 µg/mL of USP Medroxyprogesterone Acetate RS in *Mobile phase*

Sample solution: 2.5 mg/mL of Medroxyprogesterone Acetate in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between megesterol acetate and medroxyprogesterone acetate, *System suitability solution*

Relative standard deviation: NMT 3.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Medroxyprogesterone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response for each impurity from the *Sample solution*

r_S = peak response of medroxyprogesterone acetate from the *Standard solution*

C_S = concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* (mg/mL)

C_U = concentration of Medroxyprogesterone Acetate in the *Sample solution* (mg/mL)

Acceptance criteria

Individual impurity: NMT 1.0%

Total impurities: NMT 1.5%

• **LIMIT OF MEDROXYPROGESTERONE ACETATE RELATED COMPOUND A**

Standard solution: 20 mg/mL of USP Medroxyprogesterone Acetate RS and 0.1 mg/mL of USP Medroxyprogesterone Acetate Related Compound A RS in methylene chloride

Sample solution: 20 mg/mL of Medroxyprogesterone Acetate in methylene chloride

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 µL

Developing solvent system: Hexanes, *tert*-butyl methyl ether, and tetrahydrofuran (45:45:10)

Spray reagent: 200 mg/mL of *p*-toluenesulfonic acid in alcohol

Analysis

Samples: *Standard solution* and *Sample solution*

Develop the chromatogram until the solvent front has moved about 10 cm. Allow the plate to air-dry, and develop the chromatogram again until the solvent front has moved about 10 cm. Allow the plate to dry at 120° for 10 min. Spray the plate with *Spray reagent*. Heat the plate for 10 min at 120°, and examine the plate under UV light at 365 nm.

Acceptance criteria: NMT 0.5%; any blue fluorescent spot with an R_f value higher than that of the principal spot due to medroxyprogesterone acetate of the *Sample solution* is not more intense than the corresponding blue fluorescent spot of the *Standard solution*.

SPECIFIC TESTS

• **OPTICAL ROTATION, Specific Rotation (781S)**

Sample solution: 10 mg/mL in dioxane

Acceptance criteria: +45° to +51°

• **LOSS ON DRYING (731)**

Analysis: Dry a sample at 105° for 3 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

• **USP REFERENCE STANDARDS (11)**

USP Medroxyprogesterone Acetate RS

USP Medroxyprogesterone Acetate Related Compound A RS

4,5β-Dihydromedroxyprogesterone acetate.

C₂₄H₃₆O₄ 388.54

Medroxyprogesterone Acetate Injectable Suspension

DEFINITION

Medroxyprogesterone Acetate Injectable Suspension is a sterile suspension of Medroxyprogesterone Acetate in a suitable aqueous medium. It contains NLT 90.0% and NMT 110.0% of the labeled amount of medroxyprogesterone acetate (C₂₄H₃₄O₄).

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

Sample: Transfer a volume of Injectable Suspension, equivalent to 50 mg of medroxyprogesterone acetate, to a centrifuge tube, centrifuge, decant the supernatant, and wash the solids with two 15-mL portions of water, discarding the water washings. Dissolve the solids in 10 mL of chloroform, transfer to a small beaker, evaporate the chloroform on a steam bath, and dry the residue at 105° for 3 h.

Acceptance criteria: Meets the requirements

ASSAY

• **PROCEDURE**

Mobile phase: 700 mL of butyl chloride, 300 mL of hexane, both previously saturated with water, and 80 mL of acetonitrile. The acetonitrile concentration may be varied to meet *System suitability* requirements and to provide elution times of about 12 and 15 min for progesterone and medroxyprogesterone acetate, respectively. Pass the solution through a membrane filter of 1 µm or less pore size.

Internal standard solution: 0.25 mg/mL of progesterone in *Mobile phase*

Standard solution: 0.4 mg/mL of USP Medroxyprogesterone Acetate RS in *Internal standard solution*

Sample solution: Nominally 0.4 mg/mL of medroxyprogesterone acetate in *Internal standard solution*, prepared as follows. Transfer a volume of Injectable Suspension, equivalent to 50 mg of medroxyprogesterone acetate, to a suitable container. Transfer 25 mL of chloroform into the container, shake for 20 min, and centrifuge. Transfer 4 mL of the chloroform layer into a suitable container, and evaporate to dryness. Dissolve the residue in 20 mL of *Internal standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 2-mm × 25-cm; 5-µm packing L3

Flow rate: The *Mobile phase* is maintained at a flow rate capable of giving the required resolution and suitable elution times.

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 5.0 between progesterone and medroxyprogesterone acetate

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$) in the portion of Injectable Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of medroxyprogesterone acetate to the internal standard from the *Sample solution*

R_S = peak area ratio of medroxyprogesterone acetate to the internal standard from the *Standard solution*

C_S = concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of medroxyprogesterone acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **pH** (791): 3.0–7.0

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

• **USP REFERENCE STANDARDS** (11)

USP Medroxyprogesterone Acetate RS

Medroxyprogesterone Acetate Tablets

DEFINITION

Medroxyprogesterone Acetate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$).

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

Sample: Triturate a number of Tablets, equivalent to about 25 mg of medroxyprogesterone acetate, with 15 mL of chloroform. Filter, evaporate the chloroform on a steam bath, and dry the residue at 105° for 3 h.

Acceptance criteria: Meet the requirements

ASSAY

• **PROCEDURE**

Mobile phase: Acetonitrile and water (40:60)

Standard solution: 1 mg/mL of USP Medroxyprogesterone Acetate RS in acetonitrile

Sample solution: Finely powder NLT 20 Tablets. Weigh a portion of the powder, equivalent to 25 mg of medroxyprogesterone acetate, into a 50-mL glass centrifuge tube. Transfer 25 mL of acetonitrile into the tube, shake to wet the powder thoroughly, sonicate for NLT 10 min, and centrifuge. Use the clear supernatant.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of medroxyprogesterone acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• **DISSOLUTION** (711)

Medium: 0.5% sodium lauryl sulfate; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Mobile phase: Acetonitrile and water (60:40)

Sodium lauryl sulfate stock solution: Transfer 180.0 g of sodium lauryl sulfate to a 2000-mL volumetric flask. Add 1500 mL of water, and stir until dissolved. [NOTE—Several hours of stirring are required.] Dilute with water to volume.

Standard stock solution: 70 mg of USP Medroxyprogesterone Acetate RS in 140 mL of *Sodium lauryl sulfate stock solution*. Dilute with water to 250 mL. [NOTE—It may be necessary to sonicate the solution to bring the Reference Standard into solution before dilution with water.] Prepare the *Standard stock solution* fresh daily.

Standard solution: Transfer a 20-mL aliquot of *Standard stock solution* into a 1-L volumetric flask. Add 40 mL of *Sodium lauryl sulfate stock solution*, and dilute with water to volume. This solution is stable for up to 7 days.

Sample solution: Withdraw 15 mL of the solution under test and filter, discarding the first 5 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 8-cm; packing L7

Flow rate: 1.5 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.2

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$) dissolved using the responses from the *Sample solution* and *Standard solution*.

Tolerances: NLT 50% (Q) of the labeled amount of medroxyprogesterone acetate ($C_{24}H_{34}O_4$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905)

Procedure for content uniformity

Diluent: Alcohol and water (3:1)

Standard solution: 15 µg/mL of USP Medroxyprogesterone Acetate RS in *Diluent*

Sample solution: Nominally 15 µg/mL of medroxyprogesterone acetate in *Diluent* prepared as follows. Transfer 1 Tablet to a volumetric flask, dilute with *Diluent* to volume, and shake for 15 min. Filter, and quantitatively dilute a portion of the filtrate as needed.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum at about 242 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of medroxyprogesterone acetate (C₂₄H₃₄O₄) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Medroxyprogesterone Acetate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of medroxyprogesterone acetate in the *Sample solution* (µg/mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Medroxyprogesterone Acetate RS

Mefenamic Acid

C₁₅H₁₅NO₂ 241.29

Benzoic acid, 2-(2,3-dimethylphenyl)amino-

N-2,3-Xylylanthranilic acid [61-68-7].

» Mefenamic Acid contains not less than 98.0 percent and not more than 102.0 percent of C₁₅H₁₅NO₂, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Mefenamic Acid RS

Identification—

A: *Infrared Absorption* (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

Loss on drying (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II** (231): 0.002%. (Official 1-Jan-2018)

Chromatographic purity—

Buffer solution, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay*.

Standard solution—Dissolve an accurately weighed quantity of USP Mefenamic Acid RS in *Mobile phase* to obtain a solution having a known concentration of about 10 µg per mL.

Test solution—Transfer about 100 mg of Mefenamic Acid, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of each impurity in the portion of Mefenamic Acid taken by the formula:

$$100(C_S / C_U)(r_i / r_S)$$

in which C_S is the concentration, in µg per mL, of USP Mefenamic Acid RS in the *Standard solution*; C_U is the concentration, in µg per mL, of Mefenamic Acid in the *Test solution*; r_i is the peak response for each impurity obtained from the *Test solution*; and r_S is the peak response for mefenamic acid obtained from the *Standard solution*: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

Assay—

Buffer solution—Prepare a 50 mM solution of monobasic ammonium phosphate, and adjust with 3 M ammonium hydroxide to a pH of 5.0.

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, *Buffer solution*, and tetrahydrofuran (23:20:7). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Mefenamic Acid RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer about 100 mg of Mefenamic Acid, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 8200 theoretical plates; the tailing factor for the analyte peak is not more than 1.6; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C₁₅H₁₅NO₂ in the portion of Mefenamic Acid taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Mefenamic Acid RS in the *Standard preparation*; and r_U and r_S are the mefenamic acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Mefenamic Acid Capsules

» Mefenamic Acid Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of mefenamic acid ($C_{15}H_{15}NO_2$).

Packaging and storage—Preserve in tight containers.

USP Reference standards (11)—

USP Mefenamic Acid RS

Identification—

A: Place a portion of Capsule contents, equivalent to about 250 mg of mefenamic acid, in a 250-mL volumetric flask, add about 100 mL of a mixture of chloroform and methanol (3:1), and shake vigorously. Dilute with a mixture of chloroform and methanol (3:1) to volume, mix, and filter: the filtrate so obtained responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of chloroform, ethyl acetate, and glacial acetic acid (75:25:1) and the *Ordinary Impurities* (466) visualization technique 17 being used.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay*.

Dissolution (711)—

0.05 M Tris buffer—Dissolve 60.5 g of tris(hydroxymethyl)aminomethane in 6 L of water, and dilute with water to 10 L. Adjust with phosphoric acid to a pH of 9.0 ± 0.05 . To a second container, transfer about 6 liters of this solution, add 100 g of sodium lauryl sulfate, and mix to dissolve the solid material. Transfer this solution back into the first container, and mix.

Medium: 0.05 M Tris buffer; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{15}H_{15}NO_2$ dissolved, employing the procedure set forth in the *Assay*, making any necessary volumetric adjustments.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{15}H_{15}NO_2$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Mefenamic Acid*.

Assay preparation—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Weigh the contents, and determine the average weight per capsule. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of mefenamic acid, to a 500-mL volumetric flask. Add 10.0 mL of tetrahydrofuran, and sonicate for about 5 minutes with occasional mixing. Dilute with *Mobile phase* to volume, mix, and filter.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Mefenamic Acid*. Calculate the quantity, in mg, of $C_{15}H_{15}NO_2$ in the portion of Capsules taken by the formula:

$$500C(r_u / r_s)$$

in which the terms are as defined therein.

Mefloquine Hydrochloride

$C_{17}H_{16}F_6N_2O \cdot HCl$ 414.77

4-Quinolinemethanol, α -2-piperidinyl-2,8-bis(trifluoromethyl)-, monohydrochloride, (R^*, S^*)- (\pm);

DL-erythro- α -2-Piperidyl-2,8-bis(trifluoromethyl)-4-quinolinemethanol monohydrochloride [51773-92-3].

DEFINITION

Mefloquine Hydrochloride contains NLT 98.0% and NMT 102.0% of $C_{17}H_{16}F_6N_2O \cdot HCl$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

ASSAY

• PROCEDURE

Solution A: 1.5 g/L of sodium hydrogen sulfate in water

Mobile phase: Dissolve 1 g of tetraheptylammonium bromide in a 1000-mL mixture of acetonitrile, methanol, and *Solution A* (2:1:2).

System suitability solution: 4 μ g/mL each of USP Mefloquine Hydrochloride RS and USP Mefloquine Related Compound A RS in *Mobile phase*

Standard solution: 0.2 mg/mL of USP Mefloquine Hydrochloride RS in *Mobile phase*

Sample solution: 0.2 mg/mL of Mefloquine Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Guard column: 4-mm \times 3-cm; C18 (recommended)

Column: 4.0-mm \times 25-cm; 5- μ m packing L1

Column temperature: 25°

Flow rate: 0.8 mL/min

Injection size: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mefloquine related compound A and mefloquine are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between mefloquine related compound A and mefloquine, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) in the portion of Mefloquine Hydrochloride taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times 100$$

r_u = peak response of mefloquine from the *Sample solution*

r_s = peak response of mefloquine from the *Standard solution*

C_s = concentration of USP Mefloquine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Mefloquine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1-Jan-2018)

ORGANIC IMPURITIES

Mobile phase: Dissolve 1 g of tetraheptylammonium bromide in a 1-L mixture of a 1.5-g/L solution of sodium hydrogen sulfate, acetonitrile, and methanol (2:2:1).

System suitability solution: 4 µg/mL each of USP Mefloquine Hydrochloride RS and USP Mefloquine Related Compound A RS in *Mobile phase*. [NOTE—Mefloquine related compound A is *threo*-mefloquine.]

Sample stock solution: 4 mg/mL of Mefloquine Hydrochloride in *Mobile phase*

Sample solution: 4 µg/mL from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Guard column: 4-mm × 2.5-cm; 5-µm packing L1

Column: 4.0-mm × 25-cm; 5-µm packing L1

Flow rate: 0.8 mL/min

Injection size: 20 µL. [NOTE—Equilibrate the column with *Mobile phase* at a flow rate of 0.8 mL/min for 30 min.]

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for mefloquine related compound A and mefloquine are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between mefloquine related compound A and mefloquine

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Sample stock solution* and *Sample solution*
Record the chromatogram for a time that is 10 times the retention time of the main peak.

Acceptance criteria: The response of the mefloquine related compound A peak in the *Sample stock solution* is NMT twice the area of the main peak of the *Sample solution* (0.2%). The response of any other individual peak, other than the main peak of the *Sample stock solution*, is NMT that of the main peak of the *Sample solution* (0.1%); and the sum of the responses of any such peaks of the *Sample stock solution* is NMT five times the response of the main peak of the *Sample solution* (0.5%). [NOTE—Exclude the main peak and any other peak producing a response of less than 0.2 times (0.02%) the main peak of the *Sample solution*.]

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation** (781S)

Sample solution: 50 mg/mL in methanol

Acceptance criteria: -0.2° to $+0.2^\circ$

- **WATER DETERMINATION, Method I** (921): NMT 3.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store between 15° and 30° .

USP REFERENCE STANDARDS (11)

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Mefloquine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of mefloquine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard stock solution: 0.2 mg/mL of USP Mefloquine Hydrochloride RS in Medium. A small amount of methanol, not exceeding 5% of the final volume, may be used to help solubilize mefloquine.

Standard solution: 0.04 mg/mL of USP Mefloquine Hydrochloride RS in Medium from the Standard stock solution

Sample solution: Dilute a portion of the solution under test with Medium (1:5), and pass a portion through a suitable filter of 0.8-μm pore size.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: 285 nm

Cell length: 1 cm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times D \times V \times 100$$

A_U = absorbance from the Sample solution

A_S = absorbance from the Standard solution

C_S = concentration of USP Mefloquine Hydrochloride RS in the Standard solution (mg/mL)

L = label claim (mg/Tablet)

D = dilution factor of the Sample solution

V = volume of Medium, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium: 0.01 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution: 0.278 mg/mL of USP Mefloquine Hydrochloride RS in Medium. A small amount of methanol, not exceeding 2.5% of the final volume, may be used to help solubilize mefloquine.

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: 284 nm

Cell length: 0.2 cm

Blank: Medium

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance from the Sample solution

A_S = absorbance from the Standard solution

C_S = concentration of USP Mefloquine Hydrochloride RS in the Standard solution (mg/mL)

L = label claim (mg/Tablet)

V = volume of Medium, 900 mL

Tolerances: NLT 75% (Q) of the labeled amount of mefloquine hydrochloride ($C_{17}H_{16}F_6N_2O \cdot HCl$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Buffer, Diluent, Mobile phase, Standard solution, Sensitivity solution, Sample stock solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the Sample solution

r_S = peak response of mefloquine hydrochloride from the Standard solution

C_S = concentration of USP Mefloquine Hydrochloride RS in the Standard solution (mg/mL)

C_U = nominal concentration of mefloquine hydrochloride in the Sample solution (mg/mL)

Acceptance criteria: See Table 1.

[NOTE—Do not include the threo isomer, a process impurity monitored in the drug substance, in the calculation of total impurities. Disregard any peak less than 0.05%.]

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Specified (unidentified)	0.67	0.15
Specified (unidentified)	0.70	0.15
threo-Mefloquine (DL-threo-α-2-piperidyl-2,8-bis(trifluoromethyl)-4-quinolinemethanol)	0.75	—
Specified (unidentified)	0.84	0.25
Mefloquine hydrochloride	1.0	—
Any other unknown individual impurity	—	0.15
Total impurities	—	0.50

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature.
- **LABELING:** When more than one Dissolution test is given, the labeling states the Dissolution test used only if Test 1 is not used.
- **USP REFERENCE STANDARDS (11)**
USP Mefloquine Hydrochloride RS

Megestrol Acetate

$C_{24}H_{32}O_4$ 384.51
Pregna-4,6-diene-3,20-dione, 17-(acetyloxy)-6-methyl-;
17-Hydroxy-6-methylpregna-4,6-diene-3,20-dione acetate
[595-33-5].

DEFINITION

Megestrol Acetate contains NLT 97.0% and NMT 103.0% of megestrol acetate ($C_{24}H_{32}O_4$), calculated on the anhydrous basis.

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**• DISSOLUTION (711)****Test 1**

Medium: 0.5% sodium lauryl sulfate in water; 900 mL

Apparatus 2: 25 rpm

Time: 30 min

Detector: UV 292 nm

Standard solution: 45 mg of USP Megestrol Acetate RS in a 250-mL volumetric flask. Add 12 mL of methanol, and place the flask in a warm water bath until the solid is dissolved. Dilute with *Medium* to volume. The final concentration is 180 µg/mL of megestrol acetate. Dilute with *Medium*, if necessary.

Sample solution: Transfer to the surface of the *Medium* in the dissolution vessel an accurately measured volume of Oral Suspension, freshly mixed and free from air bubbles, equivalent to 160 mg of megestrol acetate. At the sampling time, withdraw a volume of the solution under test and pass through a suitable filter with 0.45-µm pore size. Dilute with *Medium*, if necessary.

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of $C_{24}H_{32}O_4$ released:

$$\text{Result} = (A_U/A_S) \times (C_S/V) \times V_D \times (100/L)$$

 A_U = absorbance of the *Sample solution* A_S = absorbance of the *Standard solution* C_S = concentration of the *Standard solution* (mg/mL) V = volume of Oral Suspension taken V_D = volume of *Medium*, 900 mL L = label claim (mg/mL)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{24}H_{32}O_4$ is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: 0.5% sodium lauryl sulfate in water; 900 mL

Apparatus 2: 25 rpm

Time: 30 min

Detector: UV 292 nm, using 0.5-cm pathlength cuvettes

Standard solution: 45 mg of USP Megestrol Acetate RS in a 250-mL volumetric flask. Add 5 mL of methanol. Dilute with *Medium* to volume. Transfer 10 mL of this solution to a 100-mL volumetric flask, and dilute

with *Medium* to volume. The final concentration is 18 µg/mL.

Sample solution: [NOTE—Use a separate syringe for each vessel.] Withdraw more than 10 mL of the Oral Suspension, using a 10-mL syringe with a long cannula. Remove air bubbles from the syringe. Adjust the volume to the 10-mL mark on the syringe, and remove the needle. Wipe the tip of the syringe, and weigh (gross weight). Operate the apparatus, and rapidly dispense the Oral Suspension to the side of the vessel at about halfway from the bottom. Similarly dispense the Oral Suspension into other vessels. Weigh each syringe after dispensing the sample (tare weight). Record sample weights. After completion of the dissolution, pass an aliquot through a suitable nylon filter with 0.45-µm pore size, and dilute 2.0 mL of the filtrate with *Medium* to 50.0 mL to obtain a solution having a theoretical concentration of about 18 µg/mL.

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of $C_{24}H_{32}O_4$ released:

$$\text{Result} = (A_U/A_S) \times (C_S/W) \times V_D \times d \times (100/L)$$

 A_U = absorbance of the *Sample solution* A_S = absorbance of the *Standard solution* C_S = concentration of the *Standard solution* (mg/mL) W = weight of the Oral Suspension taken (mg) V_D = volume of the *Medium* in the dissolution vessel, 900 mL d = density of the Oral Suspension (mg/mL), obtained by dividing the weight of Oral Suspension taken by 10 mL L = label claim (mg/mL)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{24}H_{32}O_4$ is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: 0.5% sodium lauryl sulfate in degassed water; 900 mL. [NOTE—Use ultrapure sodium lauryl sulfate with an Assay content of NLT 99.0%.]

Apparatus 2: 50 rpm

Time: 30 min

Determine the amount of $C_{24}H_{32}O_4$ dissolved by using the following method.

Mobile phase: Proceed as directed in the Assay.

Standard solution: 0.46 mg/mL of USP Megestrol Acetate RS in *Mobile phase*

Sample solution: Proceed as directed for *Test 2*, introducing the sample into the vessel over a 10- to 15-s period (about 1 mL/s).

Chromatographic system: Proceed as directed in the Assay.

Injection size: 10 µL

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of $C_{24}H_{32}O_4$ released:

$$\text{Result} = (r_U/r_S) \times (C_S/W) \times V_D \times d \times (100/L)$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of the *Standard solution* (mg/mL) W = weight of the Oral Suspension taken (mg) V_D = volume of the *Medium* in the dissolution vessel, 900 mL d = density of the Oral Suspension (mg/mL), obtained by dividing the weight of Oral Suspension taken by 10 mL L = label claim (mg/mL)

Tolerances: NLT 80% (Q) of the labeled amount of $C_{24}H_{32}O_4$ is dissolved.

- **DELIVERABLE VOLUME** (698): Meets the requirements

SPECIFIC TESTS

- **PH** (791): 3.0–4.7

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **LABELING:** When more than one test for *Dissolution* is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
USP Megestrol Acetate RS

Megestrol Acetate Tablets

DEFINITION

Megestrol Acetate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of megestrol acetate ($C_{24}H_{32}O_4$).

[NOTE—Megestrol Acetate Tablets labeled solely for veterinary use are exempt from the requirements of the *Dissolution* test.]

IDENTIFICATION

- **A.**
Sample solution: Grind a suitable number of Tablets in a known volume of chloroform, NLT 10 mL, to obtain a solution containing 4 mg/mL of megestrol acetate.
Analysis: Filter the *Sample solution* into a beaker. Pipet 0.6 mL of the filtrate into a stainless steel grinding vial containing 500 mg of potassium bromide, dry with a current of air, grind, pellet, and record the IR spectrum.
Acceptance criteria: The IR absorption spectrum of the potassium bromide dispersion so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Megestrol Acetate RS.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and water (55:45)
Diluent: Acetonitrile and water (40:60)
Internal standard solution: 0.8 mg/mL of propylparaben in acetonitrile
Standard stock solution: 1 mg/mL of USP Megestrol Acetate RS in acetonitrile
Standard solution: 80 µg/mL each of USP Megestrol Acetate RS and propylparaben in *Diluent* from the *Standard stock solution* and *Internal standard solution*, respectively
Sample solution: Nominally 80 µg/mL of megestrol acetate prepared as follows. Transfer the equivalent of 80 mg of megestrol acetate from powdered Tablets (NLT 20 Tablets) to a 100-mL volumetric flask. Add 10 mL of water, and shake for 10 min. Add 75 mL of acetonitrile, shake for 30 min, then dilute with acetonitrile to volume. Place a 25-mL aliquot in a glass-stoppered 35-mL centrifuge tube, insert the stopper, and centrifuge for 10 min. Transfer 5.0 mL of the supernatant and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, and dilute with *Diluent* to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 25 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for propylparaben and megestrol acetate are about 0.4 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 8.0 between propylparaben and megestrol acetate

Relative standard deviation: NMT 2.0% for the peak response ratio of megestrol acetate to propylparaben

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of megestrol acetate ($C_{24}H_{32}O_4$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of megestrol acetate to propylparaben from the *Sample solution*

R_S = peak response ratio of megestrol acetate to propylparaben from the *Standard solution*

C_S = concentration of USP Megestrol Acetate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of megestrol acetate in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• DISINTEGRATION (701)

Sample: Tablets labeled solely for veterinary use; proceed as directed for plain-coated Tablets, but use film-coated Tablets instead.

Time: 30 min

Acceptance criteria: Meet the requirements

• DISSOLUTION (711)

Medium: 1% sodium lauryl sulfate; 900 mL

Apparatus 2: 75 rpm

Time: 60 min

Standard solution: USP Megestrol Acetate RS in *Medium*

Sample solution: A filtered portion of the solution under test, suitably diluted with *Medium*, if necessary, to a concentration that is similar to that of the *Standard solution*.

Instrumental conditions

Analytical wavelength: UV 292 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Determine the amount of megestrol acetate ($C_{24}H_{32}O_4$) dissolved.

Tolerances: NLT 75% (Q) of the labeled amount of megestrol acetate ($C_{24}H_{32}O_4$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Standard solution: 10 µg/mL of USP Megestrol Acetate RS in methanol

Sample solution: Nominally 10 µg/mL of megestrol acetate prepared as follows. Place 1 Tablet in a volumetric flask of suitable size so that the final expected solution concentration is between 0.2 and 1.0 mg of megestrol acetate per mL. Add 1 mL of water, and gently shake until the Tablet has disintegrated. Fill the flask to three-quarters of its nominal capacity with methanol, and shake by mechanical means for 20 min. Dilute with methanol to volume, mix, and filter, discarding the first 15 mL of the filtrate. Dilute 5.0 mL of the subsequent filtrate with methanol.

Instrumental conditions

Mode: UV-Vis

Wavelength range: 260–350 nm

Analytical wavelength: Absorption maximum at about 288 nm

Cell: 1 cm

Blank: Methanol

Analysis

Samples: Standard solution, Sample solution, and Blank

Record the absorbances of the Standard solution and the Sample solution against the Blank, scanning from 260 to 350 nm.

Calculate the percentage of megestrol acetate ($C_{24}H_{32}O_4$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

 A_U = absorbance of the Sample solution A_S = absorbance of the Standard solution C_S = concentration of USP Megestrol Acetate RS in the Standard solution ($\mu\text{g/mL}$) C_U = nominal concentration of megestrol acetate in the Sample solution ($\mu\text{g/mL}$)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Tablets intended solely for veterinary use are so labeled.
- **USP REFERENCE STANDARDS (11)**
USP Megestrol Acetate RS

Meglumine $C_7H_{17}NO_5$ D-Glucitol, 1-deoxy-1-(methylamino)-;
1-Deoxy-1-(methylamino)-D-glucitol [6284-40-8].

195.21

DEFINITIONMeglumine contains NLT 99.0% and NMT 100.5% of meglumine ($C_7H_{17}NO_5$), calculated on the dried basis.**IDENTIFICATION****A.**

Sample solution: Transfer 250 mg to a dry, 50-mL centrifuge tube, add 500 mg of sodium metaperiodate, then add 5 mL of water rapidly in one portion. Allow to stand undisturbed.

Analysis: The solution instantly turns yellow, and heat is produced. The color then changes from deep yellow to orange-brown (rust), and after 20 min, the rust-colored solution is cloudy. Then add 2 mL of 2.5 N sodium hydroxide.

Acceptance criteria: The mixture turns bright yellow and becomes clear.

ASSAY**PROCEDURE**

Sample: 500 mg

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N hydrochloric acid

Endpoint detection: Visual

Analysis: Transfer the Sample into a conical flask, dissolve in 40 mL of water, and add 2 drops of methyl red

TS. Titrate with Titrant. Each mL of Titrant is equivalent to 19.52 mg of meglumine ($C_7H_{17}NO_5$).

Acceptance criteria: 99.0%–100.5% on the dried basis

IMPURITIES**Delete the following:**• **HEAVY METALS (231)**

Test preparation: Dissolve 1 g in 20 mL of water, add phenolphthalein TS, neutralize with 3 N hydrochloric acid, and dilute with water to 25 mL.

Acceptance criteria: NMT 20 $\mu\text{g/g}$ (Official 1-Jan-2018)• **RESIDUE ON IGNITION (281):** NMT 0.1%**SPECIFIC TESTS**• **ABSENCE OF REDUCING SUBSTANCES**

Sample solution: 50 mg/mL

Analysis: To 5 mL of Sample solution add 5 mL of alkaline cupric tartrate TS, and heat to boiling.

Acceptance criteria: The color of the solution does not change.

• **COMPLETENESS AND COLOR OF SOLUTION**

Sample solution: 200 mg/mL

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: Vis

Analytical wavelength: 420 nm

Cell: 1 cm

Blank: Water

Analysis

Sample: Sample solution

Acceptance criteria: Absorbance is NMT 0.030.

• **LOSS ON DRYING (731)**

Sample: 1 g

Analysis: Dry the Sample at 105° to constant weight.

Acceptance criteria: NMT 1.0%

• **MELTING RANGE OR TEMPERATURE (741):** 128°–132°• **OPTICAL ROTATION, Specific Rotation (7815)**

Sample solution: 100 mg/mL, undried, in water

Acceptance criteria: -15.7° to -17.3° **ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

Melengestrol Acetate $C_{25}H_{32}O_4$ 396.52

Pregna-4,6-diene-3,20-dione, 17-(acetyloxy)-6-methyl-16-methylene-

17-Hydroxy-6-methyl-16-methylenepregna-4,6-diene-3,20-dione acetate [2919-66-6].

» Melengestrol Acetate contains not less than 97.0 percent and not more than 103.0 percent of $C_{25}H_{32}O_4$, calculated on the dried basis.**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.**Labeling**—Label it to indicate that it is for veterinary use only.

[NOTE—The relative retention times are listed in Table 4.]

Suitability requirements

Relative standard deviation: NMT 5.0% for meloxicam, meloxicam related compound B, and meloxicam related compound C

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Meloxicam taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of the corresponding related compound from the *Standard solution*

C_S = concentration of the corresponding USP Related Compound RS in the *Standard solution* (mg/mL). [NOTE—Use the concentration of USP Meloxicam RS for unknown impurities.]

C_U = concentration of the *Sample solution* (mg/mL)

[NOTE—Use the peak response and concentration of USP Meloxicam RS for unknown impurities; for the specified impurities, calculate the percentage content of each impurity using the *Sample solution* peak responses recorded at the detection wavelength given in Table 4. For an unknown impurity, calculate the percentage content using peak responses recorded at the wavelength that gives the greater response.]

Acceptance criteria: See Table 4.

Table 4

Name	Relative Retention Time	Wavelength (nm)	Acceptance Criteria, NMT (%)
Meloxicam	1.0	350	—
Meloxicam related compound B ^a	0.8	260	0.1

^a 5-Methylthiazol-2-amine.

^b Isopropyl-4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate-1,1-dioxide.

Table 4 (Continued)

Name	Relative Retention Time	Wave-length (nm)	Acceptance Criteria, NMT (%)
Meloxicam related compound C ^b	3.2	350	0.1
Individual unknown impurity	—	260/350	0.1
Total impurities	—	—	0.3

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS**• PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.**• LABELING:** The labeling states with which *Procedure* under *Organic Impurities* the article complies if a test other than *Procedure 1* is used.**• USP REFERENCE STANDARDS (11)**

USP Meloxicam RS

USP Meloxicam Related Compound A RS

Ethyl 4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide.

C₁₂H₁₃NO₅S 283.30

USP Meloxicam Related Compound B RS

5-Methylthiazol-2-amine.

C₄H₆N₂S 114.175

USP Meloxicam Related Compound C RS

Isopropyl-4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate-1,1-dioxide.

C₁₃H₁₅NO₅S 297.33**Meloxicam Oral Suspension**

» Meloxicam Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of meloxicam (C₁₄H₁₃N₃O₄S₂).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Meloxicam RS

USP Meloxicam Related Compound B RS

2-Amino-5-methyl-thiazole.

Identification—**A: Thin-Layer Chromatographic Identification Test (201)**—

Test solution—Transfer a volume of Oral Suspension, equivalent to about 2.5 mg of meloxicam, to a 10-mL volumetric flask. Dilute with acetone to volume, and mix for 10 minutes. If necessary, pass through fluted filter paper.

Standard solution: 0.25 mg per mL, prepared by dissolving USP Meloxicam RS in 1 mL of water and diluting with acetone to volume.

Developing solvent solution: a mixture of chloroform, methanol, and ammonium hydroxide (80:20:1)

Procedure—Proceed as directed in the chapter. After removing the plate from the chamber and drying, examine the chromatograms under UV light at 254-nm: the *R_f* value (approximately 0.45) of the principal dark spot obtained

from the *Test solution* corresponds to that obtained from the *Standard solution*.

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

pH (791): between 3.5 and 4.5.

Viscosity—Rotational Methods (912)—Determine using a shear rate programmable rotational viscometer: between 40 and 100 centipoises, determined at 20°.

Dissolution (711)—**Medium:** pH 7.5 phosphate buffer; 900 mL.**Apparatus 2:** 25 rpm.**Time:** 15 minutes.

Determine the amount of C₁₄H₁₃N₃O₄S₂ dissolved by employing the following method.

Standard solution—Transfer about 20.83 mg of USP Meloxicam RS, accurately weighed, into a 100-mL volumetric flask. Dissolve in 5 mL of methanol and 1 mL of 0.1 M sodium hydroxide, and dilute with *Medium* to volume. Dilute with *Medium* to a final concentration of about 8.3 µg per mL of meloxicam.

Test solution—Shake each sample for 15 minutes. Weigh six portions, equivalent to 7.5 mg of the Oral Suspension, into separate tared 10-mL beakers, and record each weight. Introduce each of the samples to the middle of the dissolution vessels, and rinse each beaker with about 20 mL of the *Medium* withdrawn from the vessel. Carefully lower the paddle to the appropriate height and start the rotation. After completion of the dissolution, pass a 20-mL aliquot through a nylon filter having a 0.45-µm porosity, discarding the first 3 mL of the filtrate.

Procedure—Determine the amount of C₁₄H₁₃N₃O₄S₂ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 362 nm on the *Test solution* in comparison with the *Standard solution*, using *Medium* as the blank. Calculate the percentage of C₁₄H₁₃N₃O₄S₂ released by the formula:

$$\frac{A_U \times C_S \times 900 \times d \times 100}{A_S \times W_U \times LC}$$

in which *A_U* and *A_S* are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively; *C_S* is the concentration, in mg per mL, of the *Standard solution*; *d* is the density, in g per mL, of the Oral Suspension; *W_U* is the weight, in mg, of the Oral Suspension taken; 900 is the volume, in mL, of the *Medium*; 100 is the conversion factor to percentage; and *LC* is the label claim, in mg per mL.

Tolerances—Not less than 75% (*Q*) of the labeled amount of C₁₄H₁₃N₃O₄S₂ is dissolved in 15 minutes.

Microbial enumeration tests (61) and Tests for specified microorganisms (62)—The total aerobic microbial count does not exceed 100 cfu per g or 100 cfu per mL. The total yeasts and molds count does not exceed 50 cfu per g or 50 cfu per mL. It meets the requirements of the test for the absence of *Escherichia coli*.

Chromatographic purity—

Buffer, Mobile phase, and Diluent—Proceed as directed in the *Assay*.

Related compound standard stock solution—Proceed as directed for *Related compound standard stock preparation* in the *Assay*.

Sensitivity solution—Dilute the *Related compound standard stock solution* with *Diluent* to a final concentration of about 0.08 µg per mL.

Related compound standard solution—Dilute *Related compound standard stock preparation* with *Diluent* to a final concentration of about 0.5 µg per mL.

Test solution—Proceed as directed for Assay preparation in the Assay.

Chromatographic system (see Chromatography (621))—Proceed as directed in the Assay. Chromatograph the *Sensitivity solution* (about 10 μ L), and record the peak responses as directed for Procedure at 260 nm: the relative standard deviation of three replicate injections is not more than 10% for meloxicam related compound B. Chromatograph the *Related compound standard solution* (about 10 μ L), and record the peak responses as directed for Procedure at 260 nm: the tailing factor for meloxicam related compound B is not more than 2.0.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Related compound standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and record the peak areas at 260 nm and 360 nm. The run time is about 20 minutes or two times the retention time of meloxicam. Calculate the percentage of meloxicam related compound B in the portion of Oral Suspension taken by the formula:

$$(5000/L)(C/V)(r_U / r_S)$$

in which L is the label claim, in mg per mL; C is the concentration, in mg per mL, of USP Meloxicam Related Compound B RS in the *Related compound standard solution*; V is the volume, in mL, of Oral Suspension taken to prepare the *Test solution*; r_U is the peak area obtained for meloxicam related compound B in the *Test solution* at 260 nm; and r_S is the peak area for meloxicam related compound B in the *Related compound standard solution* at 260 nm. Calculate the percentage of each unknown degradation product in the portion of Oral Suspension taken by the formula:

$$100(r_i / r_S)$$

in which r_i is the area of any unknown degradant at 360 nm; r_S is the sum of areas of meloxicam and all impurities in the *Test solution* at 360 nm. Not more than 0.15% of meloxicam related compound B is found; not more than 0.2% of any individual unknown degradation product is found; and not more than 0.5% of total degradation products is found.

Assay—

Buffer—Dissolve 2 g of monohydrate citric acid and 2 g of boric acid in 1000 mL of water, and adjust with dihydrate trisodium citrate to a pH of 2.9.

Mobile phase—Mix 565 mL of Buffer, 260 mL of methanol, and 200 mL of acetonitrile. Degas the solution, and then dissolve 200 mg of sodium dodecyl sulfate in 1000 mL of the resulting solution.

Diluent—Dissolve 3 g of boric acid and 1.5 g of dihydrate trisodium citrate in 1000 mL of water, and adjust with 2 M sodium hydroxide to a pH of 8.3. Mix 420 mL of the resulting buffer with 420 mL of methanol and 160 mL of acetonitrile.

Standard stock preparation—Transfer about 67 mg of USP Meloxicam RS, accurately weighed, into a 100-mL volumetric flask. Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with Diluent to just below volume. Sonicate for 30 minutes, and mix until dissolved. Cool to room temperature. Dilute with Diluent to volume.

Standard preparation—Dilute Standard stock preparation with Diluent to a final concentration of about 0.27 mg per mL.

Related compound standard stock preparation—Transfer about 21 mg of USP Meloxicam Related Compound B RS, accurately weighed, into a 100-mL volumetric flask. Add 3.0 mL of dimethylformamide, 15 mL of methanol, and about 60 mL of Diluent. Sonicate, and mix until dissolved. Cool to room temperature. Dilute with Diluent to volume.

Dilute further with Diluent to a concentration of about 8.4 μ g per mL.

System suitability solution—Transfer a volume of Oral Suspension, equivalent to about 15 mg of meloxicam, accurately weighed, to a 50-mL volumetric flask. Add 3.0 mL of *Related compound standard stock preparation*. Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with Diluent to just below volume. Sonicate for 30 minutes, mixing the flask vigorously about every 5 minutes. Cool to room temperature. Dilute with Diluent to volume. Mix, and allow particulates to settle. Pass through a 0.45- μ m membrane filter with a fiberglass prefilter.

Assay preparation—Transfer an accurately measured volume of Oral Suspension, equivalent to about 15 mg of meloxicam, to a 50-mL volumetric flask. Add 3.0 mL of dimethylformamide. Swirl the flask, and allow to stand for about 5 minutes. Add 15 mL of methanol. Dilute with Diluent to just below volume. Sonicate for 30 minutes, mixing the flask vigorously about every 5 minutes. Cool to room temperature. Dilute with Diluent to volume. Mix, and allow particulates to settle. Pass through a 0.45- μ m membrane filter with a fiberglass prefilter.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a programmable dual wavelength detector, a single wavelength detector in series, or a photodiode array detector capable of detecting wavelengths from 190 nm to 400 nm, or equivalent, and a 4-mm \times 12.5-cm analytical column that contains 5- μ m packing L1. The column temperature is maintained at 40°. The flow rate is about 1.0 mL per minute. The run time is about 20 minutes or two times the retention time of meloxicam. Chromatograph the *System suitability solution* (about 10 μ L), and record the peak responses as directed for Procedure at 360 nm and 260 nm: at 360 nm the resolution, R , between meloxicam and any other adjacent peak is not less than 1.5. The tailing factor for the meloxicam peak is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for Procedure at 360 nm: the relative standard deviation for replicate injections of the *Standard preparation* is not more than 1.5%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and record the peak areas at 360 nm. Calculate the amount of meloxicam ($C_{14}H_{13}N_3O_4S_2$), in mg per mL, in the portion of Oral Suspension taken by the formula:

$$50(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken to prepare the *Assay preparation*; r_U is the peak area obtained for meloxicam in the *Assay preparation* at 360 nm; and r_S is the peak area for meloxicam in the *Standard solution* at 360 nm.

Meloxicam Tablets

» Meloxicam Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of meloxicam ($C_{14}H_{13}N_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—
USP Meloxicam RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

0.1 N Methanolic sodium hydroxide—Dilute 100 mL of 1 N sodium hydroxide with methanol to 1000 mL.

Test solution—Transfer a portion of finely powdered Tablets, equivalent to about 50 mg of meloxicam, to a suitable flask. Add 5 mL of 0.1 N Methanolic sodium hydroxide, and mix. Add 20 mL of methanol, and stir for about 15 minutes. Filter the mixture to remove insoluble material, and use the filtrate.

Standard solution—Transfer about 20 mg of USP Meloxicam RS, accurately weighed, to a 10-mL volumetric flask, dissolve in 2 mL of 0.1 N Methanolic sodium hydroxide, dilute with methanol to volume, and mix.

Developing solvent system—Prepare a mixture of chloroform, methanol, and ammonia water (25%) (80:20:1).

Procedure—Proceed as directed in the chapter.

B: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution (711)—

Medium: pH 7.5 phosphate buffer (prepared by dissolving 6.81 g of potassium dihydrogen phosphate in 800 mL of water, adjusting the pH to 7.5 with 0.5 N sodium hydroxide, and diluting with water to 1 L); 900 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Determine the amount of meloxicam dissolved by employing the following method.

Standard solution—

FOR TABLETS LABELED TO CONTAIN 7.5 MG—Transfer about 33.3 mg of USP Meloxicam RS, accurately weighed, to a 100-mL volumetric flask. Add 5.0 mL of methanol, 1.0 mL of 0.1 N sodium hydroxide, dilute with Medium to volume, and mix. Transfer 5.0 mL to a 100-mL volumetric flask, dilute with Medium to volume, and mix. Transfer 25.0 mL of the resulting solution to a 50-mL volumetric flask, dilute with Medium to volume, and mix.

FOR TABLETS LABELED TO CONTAIN 15 MG—Transfer about 33.3 mg of USP Meloxicam RS, accurately weighed, to a 100-mL volumetric flask. Add 5.0 mL of methanol, 1.0 mL of 0.1 N sodium hydroxide, dilute with Medium to volume, and mix. Transfer 5.0 mL to a 100-mL volumetric flask, dilute with Medium to volume, and mix.

Test solution—Use portions of the solution under test passed through a suitable 10-μm filter, discarding the first few mL.

Procedure—Determine the percentage of the labeled amount of meloxicam dissolved by employing UV absorption, using a suitable spectrophotometer, at the wavelength of maximum absorbance at about 362 nm, using 1-cm cuvettes, on the Test solution in comparison with the Standard solution using Medium as blank. Calculate the percentage of meloxicam dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which A_U and A_S are the absorbances obtained from the Test solution and the Standard solution, respectively; C_S is the concentration, in mg per mL, of the Standard solution; 900 is the volume, in mL, of Medium; 100 is the conversion factor to percentage; and LC is the Tablet label claim, in mg.

Tolerances—Not less than 70% (Q) of the labeled amount of meloxicam is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Related compounds—

Solution A, Solution B, and Mobile phase—Proceed as directed in the Assay.

Standard solution—Use the Standard preparation from the Assay.

System sensitivity solution—Transfer 4 mL of the Standard solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5 mL of the resulting solution to a 50-mL volumetric flask, add 5 mL of 1 N sodium hydroxide, and dilute with methanol to volume.

Test solution—Use the Assay preparation.

Chromatographic system (see Chromatography (621))—Proceed as directed in the Assay, except to chromatograph the Standard solution and the System sensitivity solution: the tailing factor for the meloxicam peak is not more than 2.0; the relative standard deviation for replicate injections of the Standard solution is not more than 2.0%; and the signal-to-noise ratio of the meloxicam peak in the chromatogram of the System sensitivity solution is not less than 10.

Procedure—Separately inject equal volumes (about 25 μL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the peak responses. Determine the relative retention times for the impurity peaks relative to that of the meloxicam peak. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(5000/3)(1/F)(C/W)(A/L)(r_i/r_s)$$

in which F is the relative response factor for each impurity and is equal to 2.7 for the impurity with a relative retention time of about 0.5 (meloxicam related compound B [2-amino-5-methylthiazole]) and 1.0 for all other impurities; C is the concentration, in mg per mL, of USP Meloxicam RS in the Standard solution; W is the weight, in mg, of powdered Tablets taken to prepare the Test solution; A is the average weight of a Tablet; L is the labeled amount, in mg, of meloxicam in each Tablet; r_i is the peak response obtained for each impurity in the Test solution; and r_s is the peak response for meloxicam in the Standard solution: not more than 0.15% of meloxicam related compound B is found; not more than 0.2% of any individual unknown impurity is found; and not more than 0.5% of total impurities is found.

Assay—

Solution A—Dissolve 2.0 g of dibasic ammonium phosphate in 1 L of water, and adjust with phosphoric acid to a pH of 7.0 ± 0.1 .

Solution B—Mix 650 mL of methanol and 100 mL of isopropyl alcohol.

Mobile phase—Prepare a filtered and degassed mixture of Solution A and Solution B (63:37). Make adjustments if necessary (see System Suitability under Chromatography (621)).

Standard stock preparation—[NOTE—The Standard stock preparation is prepared so that the final concentration of meloxicam, in mg per mL, is approximately equivalent to the concentration of the Assay stock preparation.] Transfer a suitable quantity of USP Meloxicam RS, accurately weighed, to a 50-mL volumetric flask, dissolve in 1 mL of 1 N sodium hydroxide and 30 mL of methanol, and dilute with methanol to volume. Transfer 10 mL of the resulting solution to a 100-mL volumetric flask, add 10 mL of 1 N sodium hydroxide, and dilute with methanol to volume.

Standard preparation—Transfer 15 mL of the Standard stock preparation to a 25-mL volumetric flask, and dilute with water to volume.

Assay stock preparation—Transfer 10 Tablets to a 1000-mL volumetric flask, add about 100 mL of 1 N sodium hydroxide, shake to disperse the Tablets, and add 800 mL of methanol. Sonicate the solution for about 15 minutes, then stir for 30 minutes. Dilute with methanol to volume, and mix. Filter the resulting solution, and use the filtrate.

Assay preparation—Transfer 15 mL of the *Assay stock preparation* to a 25-mL volumetric flask, and dilute with water to volume.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector, a guard column that contains packing L1, and a 4-mm \times 10-cm column that contains packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the meloxicam peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard preparation* and the *Assay preparation* to the chromatograph, record the chromatograms, and measure the responses for the meloxicam peak. Calculate the quantity, in mg, of meloxicam ($C_{14}H_{13}N_3O_4S_2$) in the portion of Tablets taken by the formula:

$$5000(C/3)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Meloxicam RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Melphalan

$C_{13}H_{18}Cl_2N_2O_2$ 305.20

L-Phenylalanine, 4-bis(2-chloroethyl)amino]-

L-3-[p-[Bis(2-chloroethyl)amino]phenyl]alanine [148-82-3].

» Melphalan contains not less than 93.0 percent and not more than 100.5 percent of $C_{13}H_{18}Cl_2N_2O_2$, calculated on the dried and ionizable chlorine-free basis.

Caution—Handle Melphalan with exceptional care because it is a highly potent agent.

Packaging and storage—Preserve in tight, light-resistant, glass containers.

USP Reference standards (11)—

USP Melphalan Hydrochloride RS

Identification—

A: Ultraviolet Absorption (197U)—

Solution: 5 μ g per mL.

Medium: methanol.

B: To 1 mL of 1 in 10,000 solution in alcohol in a glass-stoppered test tube add 1 mL of pH 4.0 acid phthalate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), 1 mL of a 1 in 20 solution of 4-(p-nitrobenzyl)pyridine in acetone, and 1 mL of saline TS. Heat on a water bath at 80° for 20 minutes, and cool quickly. Add 10 mL of alcohol and 1 mL of 1 N potassium hydroxide: a violet to red-violet color is produced.

C: Heat 100 mg with 10 mL of 0.1 N sodium hydroxide on a water bath for 10 minutes; the resulting solution, after acidification with 2 N nitric acid, responds to the tests for Chloride (191).

Specific rotation (781S): between -30° and -36° .

Test solution: 7 mg per mL, in methanol, prepared with the aid of gentle heating.

Loss on drying (731): Dry it in vacuum at 105° to constant weight: it loses not more than 7.0% of its weight.

Residue on ignition (281): not more than 0.3%.

Ionizable chlorine—Dissolve about 500 mg of Melphalan, accurately weighed, in a mixture of 75 mL of water and 2 mL of nitric acid, allow to stand for 2 minutes, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically: not more than 1.0 mL of 0.1 N silver nitrate is required for each 500 mg of test specimen.

Nitrogen Determination (461)—Determine the nitrogen content as directed under *Method II*, using about 325 mg of Melphalan, accurately weighed, and 0.1 N sulfuric acid VS for the titration: not less than 8.90% and not more than 9.45% of N is found, calculated on the dried basis.

Assay—Transfer to a beaker about 200 mg of Melphalan, accurately weighed, and dissolve in 20 mL of 0.5 N sodium hydroxide. Cover the beaker with a watch glass, and boil the solution for 30 minutes, adding water as necessary to maintain the volume. Cool, neutralize to phenolphthalein TS with acetic acid, and add 1 mL of acetic acid in excess. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using silver and calomel electrodes, the latter modified to contain saturated potassium sulfate solution. From the results obtained in the test for *Ionizable chlorine*, calculate the volume, in mL, of 0.1 N silver nitrate that is equivalent to the ionizable chlorine in the quantity of Melphalan taken for the *Assay*, and subtract it from the *Assay* titration volume. Each mL of 0.1 N silver nitrate is equivalent to 15.26 mg of $C_{13}H_{18}Cl_2N_2O_2$.

Melphalan Tablets

» Melphalan Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of melphalan ($C_{13}H_{18}Cl_2N_2O_2$).

Packaging and storage—Preserve in well-closed, light-resistant, glass containers.

USP Reference standards (11)—

USP Melphalan Hydrochloride RS

Identification—

A: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: Shake a portion of finely powdered Tablets, equivalent to about 2 mg of melphalan, with 20 mL of alcohol, and filter: a 1-mL portion of the solution so obtained responds to *Identification* test B under *Melphalan*.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the amount of $C_{13}H_{18}Cl_2N_2O_2$ dissolved by employing the following method.

Mobile phase—Transfer 2 grams of ammonium acetate, 2 mL of glacial acetic acid, and 0.4 mL of triethylamine to a suitable flask containing 1500 mL of water and 500 mL of acetonitrile. Stir until all solids are dissolved and well mixed, then filter and degas.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 5-cm column that contains packing L7.

The flow rate is about 1.5 mL per minute. Chromatograph replicate injections of the Standard solution, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 3.0%.

Procedure—Inject a volume (about 50 μ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of $C_{13}H_{18}Cl_2N_2O_2$ dissolved in comparison with a Standard solution having a known concentration of USP Melphalan Hydrochloride RS in the same *Medium* and similarly chromatographed.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{13}H_{18}Cl_2N_2O_2$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—Place 1 Tablet in a 200-mL volumetric flask, add 10 mL of water and 10 mL of alcohol, sonicate to dissolve the soluble components in the mixture, dilute with alcohol to volume, mix, and filter to obtain a clear solution. Dissolve an accurately weighed quantity of USP Melphalan Hydrochloride RS in alcohol to obtain a Standard solution having a known concentration of about 10 μ g per mL. Concomitantly determine the absorbances of the solution from the Tablet and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 260 nm, with a suitable spectrophotometer, using alcohol as the blank. Calculate the quantity, in mg, of melphalan ($C_{13}H_{18}Cl_2N_2O_2$) in the Tablet taken by the formula:

$$(305.20/341.66)(T/D)C(A_U / A_S)$$

in which 305.20 and 341.66 are the molecular weights of melphalan and melphalan hydrochloride, respectively; *T* is the labeled quantity, in mg, of melphalan in the Tablet; *D* is the concentration, in μ g per mL, of melphalan in the solution from the Tablet, on the basis of the labeled quantity per Tablet and the extent of dilution; *C* is the concentration, in μ g per mL, of USP Melphalan Hydrochloride RS in the Standard solution; and *A_U* and *A_S* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

Assay—

Mobile phase—Prepare a solution of 0.025 M diethylamine in a mixture of methanol and water (1:1), adjust with 3.5 N hydrochloric acid to a pH of 5.5, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Melphalan Hydrochloride RS in alcohol, and quantitatively dilute with alcohol to obtain a solution having a known concentration of about 0.9 mg of melphalan hydrochloride per mL. Pipet 10 mL of this solution into a 100-mL volumetric flask containing 75 mL of alcohol and 2.0 mL of glacial acetic acid, dilute with alcohol to volume, and mix to obtain a *Standard preparation* having a known concentration of about 90 μ g of USP Melphalan Hydrochloride RS per mL (equivalent to about 80 μ g of melphalan per mL).

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to 8 mg of anhydrous melphalan, to a 100-mL volumetric flask. Add about 75 mL of alcohol and 2.0 mL of glacial acetic acid to the flask, and sonicate for 15 minutes. Cool, dilute with alcohol to volume, and mix. Filter through a medium-porosity, sintered-glass funnel, discarding the first few mL of the filtrate, and use the remainder of the filtrate as the *Assay preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector

and a 4.2-mm \times 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (between 10 and 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of melphalan ($C_{13}H_{18}Cl_2N_2O_2$) in the portion of Tablets taken by the formula:

$$(305.20/341.67)(0.1C)(r_U / r_S)$$

in which 305.20 and 341.67 are the molecular weights of melphalan and melphalan hydrochloride, respectively; *C* is the concentration, in μ g per mL, of melphalan hydrochloride in the *Standard preparation*; and *r_U* and *r_S* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Memantine Hydrochloride

$C_{12}H_{21}N \cdot HCl$
Tricyclo[3.3.1.1^{3,7}]decan-1-amine, 3,5-dimethyl-, hydrochloride;
1-Amino-3,5-dimethyladamantane hydrochloride
[41100-52-1].

215.76

DEFINITION

Memantine Hydrochloride contains NLT 98.0% and NMT 102.0% of memantine hydrochloride ($C_{12}H_{21}N \cdot HCl$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

ASSAY

• PROCEDURE

Internal standard solution: 4.0 mg/mL of adamantane in *n*-hexane

Standard solution: 4.0 mg/mL of USP Memantine Hydrochloride RS in *Internal standard solution* prepared as follows. Transfer 100 mg of USP Memantine Hydrochloride RS to a 50-mL centrifuge tube. Add 15 mL of 1 N sodium hydroxide, and mix. Add 25 mL of *Internal standard solution*, and shake for 15 min. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Sample solution: 4.0 mg/mL of Memantine Hydrochloride in *Internal standard solution* prepared as follows. Transfer 100 mg of Memantine Hydrochloride to a 50-mL centrifuge tube. Add 15 mL of 1 N sodium hydroxide, and mix. Add 25 mL of *Internal standard solution*, and shake for 15 min. Allow the layers to separate, and filter a portion of the top hexane layer through anhydrous sodium sulfate. Use the clear filtrate.

Chromatographic system(See *Chromatography* <621>, *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 50-m × 0.32-mm; 0.52-μm packing G27

Temperatures

Injection port: 220°

Detector: 300°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
50	5	145	0
145	10	250	20

Carrier gas: Helium

Flow rate: 4.0 ± 0.4 mL/min

Injection volume: 1 μL

Injection type: Split ratio, 1:50

System suitabilitySample: *Standard solution***Suitability requirements**

Tailing factor: NMT 2.0 each for memantine and adamantane

Relative standard deviation: NMT 2.0% for the ratio of the peak areas of adamantane and memantine

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of memantine hydrochloride (C₁₂H₂₁N · HCl) in the portion of Memantine Hydrochloride taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of memantine to the internal standard from the *Sample solution*

R_S = peak response ratio of memantine to the internal standard from the *Standard solution*

C_S = concentration of USP Memantine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Memantine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES**Delete the following:**

• **HEAVY METALS**, *Method II* <231>: NMT 10 ppm • (Official 1-

Jan-2018)

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **ORGANIC IMPURITIES**

Standard stock solution A: 2.5 mg/mL each of USP Memantine Related Compound A RS, USP Memantine Related Compound B RS, USP Memantine Related Compound C RS, USP Memantine Related Compound D RS, and USP Memantine Related Compound E RS in *n*-hexane

Standard stock solution B: 2.5 mg/mL of USP Memantine Hydrochloride RS prepared as follows. To the flask containing a weighed amount of USP Memantine Hydrochloride RS, add 5.0 N sodium hydroxide to fill 20% of the final volume and *n*-hexane to fill 20% of the final volume. Shake for 10 min, and transfer the contents to a separator. Allow the layers to separate, filter a portion of the top hexane layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to

stand for a few min to ensure all the remaining water has been removed. Use the clear filtrate.

System suitability solution: 25 μg/mL each of USP Memantine Related Compound A RS, USP Memantine Related Compound B RS, USP Memantine Related Compound C RS, USP Memantine Related Compound D RS, and USP Memantine Related Compound E RS, from *Standard stock solution A* in *Standard stock solution B*. The concentration of USP Memantine Hydrochloride RS is 2.5 mg/mL.

Standard solution: 25 μg/mL each of USP Memantine Related Compound A RS, USP Memantine Related Compound B RS, USP Memantine Related Compound C RS, USP Memantine Related Compound D RS, USP Memantine Related Compound E RS, and USP Memantine Hydrochloride RS, from *Standard stock solution A* and *Standard stock solution B*, respectively, in *n*-hexane

Sample solution: 25 mg/mL of Memantine Hydrochloride prepared as follows. Transfer the weighed amount of Memantine Hydrochloride to a suitable volumetric flask. Add 5.0 N sodium hydroxide to fill 30% of the final volume and *n*-hexane to fill 40% of the final volume. Shake for 10 min, and transfer the contents to a separator. Allow the layers to separate, filter a portion of the top hexane layer, dry the organic layer by swirling with anhydrous sodium sulfate, and allow to stand for a few min to ensure all the remaining water has been removed. Use the clear filtrate.

Chromatographic system: Proceed as directed in the *Assay*.

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 2 for the relative retention times.]

Suitability requirements

Resolution: NLT 6.0 between memantine and memantine related compound B; NLT 2.0 between memantine related compound B and memantine related compound C, *System suitability solution*

Tailing factor: NMT 2.0 for memantine, *Standard solution*

Relative standard deviation: NMT 10.0% for memantine, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

[NOTE—Ignore the peaks at the relative retention times 0.11, 0.12, 0.13, 0.18, and 0.26 with respect to the memantine peak, as they correspond to residual solvents.]

Calculate the percentage of each of memantine related compounds A, B, C, D, and E in the portion of Memantine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of memantine related compounds A, B, C, D, or E from the *Sample solution*

r_S = peak response of the corresponding USP Memantine Related Compound RS from the *Standard solution*

C_S = concentration of the corresponding USP Memantine Related Compound RS in the *Standard solution* (mg/mL)

C_U = concentration of Memantine Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity in the portion of Memantine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of any other impurity from the *Sample solution*

r_S = peak response of memantine hydrochloride from the *Standard solution*

- C_s = concentration of USP Memantine Hydrochloride RS in the *Standard solution* (mg/mL)
 C_u = concentration of Memantine Hydrochloride in the *Sample solution* (mg/mL)
Acceptance criteria: See Table 2.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Memantine related compound A	0.77	0.15
Memantine	1.0	—
Memantine related compound B	1.03	0.15
Memantine related compound C	1.07	0.15
Memantine related compound D	1.19	0.15
Memantine related compound E	1.44	0.15
Any individual unspecified impurity	—	0.10
Total impurities	—	0.50

Memantine Hydrochloride Tablets**DEFINITION**

Memantine Hydrochloride Tablets contain an amount of memantine hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of memantine hydrochloride ($C_{12}H_{21}N \cdot HCl$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
 Analytical range: 4000–400 cm^{-1}
Standard: 6.7 mg/mL of USP Memantine Hydrochloride RS in dichloromethane. Shake for 10 min, and pass through a suitable filter. Evaporate the solvent at room temperature. Collect the residue powder, and dry at 60° for 15 min. Prepare an approximate 1% (w/w) dispersion of the sample in potassium bromide.

Sample: 6.7 mg/mL of memantine hydrochloride in dichloromethane from NLT 20 crushed Tablets. Shake for 10 min, and centrifuge for 10 min. Pass the supernatant through a suitable filter. Evaporate the solvent at room temperature. Collect the residue powder, and dry at 60° for 15 min. Prepare an approximate 1% (w/w) dispersion of the sample in potassium bromide.

Acceptance criteria: Fingerprint region of the *Standard* and *Sample* spectrum exhibit maxima at the same wave numbers.

- **B.** The retention time of the memantine peak of the *Sample solution* corresponds to that of the memantine peak of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 200 mg/mL of sodium hydroxide in water

Internal standard solution: 25 $\mu g/mL$ of USP

Amantadine Hydrochloride RS in water

Standard stock solution: 25 $\mu g/mL$ of USP Memantine Hydrochloride RS prepared as follows. Weigh a suitable quantity of the Standard into a volumetric flask. Add methanol to fill 40% of the final flask volume, and sonicate. Dilute with water to volume.

Standard solution: Pipet 4.0 mL each of the *Internal standard solution* and the *Standard stock solution* into a test tube. Add 2 mL of *Solution A*, and mix on a vortex mixer for 1 min. Add 4.0 mL of toluene, and mix on a vortex mixer for 3 min. Allow the two layers to separate. Inject the toluene layer.

Sample stock solution: Nominally 20 $\mu g/mL$ of memantine hydrochloride prepared as follows. Transfer a suitable number of Tablets to a volumetric flask to obtain a 0.1 mg/mL memantine hydrochloride solution. Add methanol to fill 40% of the final flask volume, and sonicate for 30 min with intermittent shaking. Add water to fill 40% of the final flask volume, and sonicate for 30 min with intermittent shaking. Dilute with water to volume, and centrifuge a portion for 10 min. Pipet a suitable volume of the clear centrifugate into a volumetric flask, and dilute with water to volume.

Sample solution: Pipet 5.0 mL of the *Sample stock solution*, 4.0 mL of the *Internal standard solution*, and 2 mL of *Solution A* into a test tube, and mix on a vortex mixer for 1 min. Add 4.0 mL of toluene, and mix on a vortex mixer for 5 min. Allow the two layers to separate. Inject the toluene layer.

Blank: To 5.0 mL of 80 $\mu L/mL$ of methanol in water add 2 mL of *Solution A*, and mix on a vortex mixer for 1 min. Add 4.0 mL of toluene, and mix on a vortex mixer for 5 min. Allow the two layers to separate. Inject the toluene layer.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

50	0	50	2
50	20	140	0
140	30	200	5

Carrier gas: Helium
Flow rate: 34.8 psi
Injection volume: 4 μ L
Injection type: Split ratio, 1:10

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for amantadine and memantine are 0.97 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between amantadine and memantine

Tailing factor: NMT 2.5 for amantadine; NMT 2.0 for memantine

Relative standard deviation: NMT 2.0% for the ratio of the peak areas of amantadine and memantine

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of memantine hydrochloride ($C_{12}H_{21}N \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak area ratio of memantine to amantadine from the *Sample solution*

R_S = peak area ratio of memantine to amantadine from the *Standard solution*

C_S = concentration of USP Memantine Hydrochloride RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of memantine hydrochloride in the *Sample solution* (μ g/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION (711)**

Medium: 0.1 N hydrochloric acid with sodium chloride (2 g/L of sodium chloride in water), adjusted with hydrochloric acid to a pH of 1.2; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard stock solution: (L/900) mg/mL of USP Memantine Hydrochloride RS in *Medium*, where L is the label claim in mg/Tablet

Internal standard solution: 28 μ g/mL of USP Amantadine Hydrochloride RS in *Medium*

Standard solution

For Tablets labeled to contain 5 mg: Transfer 5 mL of the *Standard stock solution* to a test tube, add 1 mL of the *Internal standard solution* and 2 mL of 5 N sodium hydroxide, and mix for 1 min. Add 3 mL of toluene, and mix for 2 min. Use the toluene layer.

For Tablets labeled to contain 10 mg: Transfer 5 mL of the *Standard stock solution* to a test tube, add 2 mL of the *Internal standard solution* and 2 mL of 5 N sodium hydroxide, and mix for 1 min. Add 3 mL of toluene, and mix for 2 min. Use the toluene layer.

Sample solution: Pass a portion of the solution under test through a suitable filter.

For Tablets labeled to contain 5 mg: Transfer 5 mL of the filtrate to a test tube, add 1 mL of the *Internal standard solution* and 2 mL of 5 N sodium hydroxide, and mix for 1 min. Add 3 mL of toluene, and mix for 2 min. Use the toluene layer.

For Tablets labeled to contain 10 mg: Transfer 5 mL of the filtrate to a test tube, add 2 mL of the *Internal standard solution* and 2 mL of 5 N sodium hydroxide, and mix for 1 min. Add 3 mL of toluene, and mix for 2 min. Use the toluene layer.

Chromatographic system

» Menadiol Sodium Diphosphate contains not less than 97.5 percent and not more than 102.0 percent of $C_{11}H_8Na_4O_8P_2$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store in a cold place.

Identification—

A: Dissolve about 200 mg of Menadiol Sodium Diphosphate in 10 mL of water, add 10 mL of 2 N sulfuric acid, 10 mL of 0.1 N ceric sulfate, and 1 mL of 30 percent hydrogen peroxide previously diluted with 5 mL of water, and extract the solution with two 10-mL portions of chloroform. Gently evaporate the clear chloroform solution on a steam bath to dryness, and dry the residue at 80° for 1 hour: the menadione so obtained melts between 104° and 107°.

B: To 50 mg of the dried residue obtained in *Identification* test A add 5 mL of water, then add 75 mg of sodium bisulfite, and heat on a steam bath, shaking vigorously until the substance is dissolved and the solution is practically colorless. Dilute with water to 50 mL, and mix. To 2 mL of the solution add 2 mL of alcoholic ammonia (prepared by mixing equal volumes of alcohol and ammonium hydroxide), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, and on the addition of 1 mL of sodium hydroxide solution (1 in 3), it changes to green and then to yellow.

C: To about 20 mg contained in a small beaker add 1 mL of water, 2 drops of nitric acid, and 1 mL of sulfuric acid, and heat slowly to the evolution of white fumes. Cool, cautiously dilute with water to about 10 mL, and filter if not clear. Render the filtrate slightly alkaline to litmus with 6 N ammonium hydroxide, then render it acid with nitric acid, and add to the warm solution 3 mL of ammonium molybdate TS: a yellow precipitate is formed within a few minutes.

Water Determination, Method I (921): between 19.0% and 21.5%.

Assay—Dissolve about 100 mg of Menadiol Sodium Diphosphate, accurately weighed, in 25 mL of water, and add 25 mL of glacial acetic acid and 25 mL of 3 N hydrochloric acid. Titrate the solution with 0.02 N ceric sulfate VS, determining the endpoint potentiometrically using a calomel-platinum electrode system. Each mL of 0.02 N ceric sulfate is equivalent to 4.221 mg of $C_{11}H_8Na_4O_8P_2$.

Menadiol Sodium Diphosphate Injection

» Menadiol Sodium Diphosphate Injection is a sterile solution of Menadiol Sodium Diphosphate in Water for Injection. It contains not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$.

Packaging and storage—Preserve in single-dose, light-resistant containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Menadione RS

Identification—

A: Transfer a volume of Injection, equivalent to about 100 mg of menadiol sodium diphosphate, to a separator, add 10 mL of 2 N sulfuric acid, and extract with six 25-mL portions of ether, discarding the ether extracts. To the aqueous solution add 1 mL of 0.5 N ceric sulfate and 1 mL of

30 percent hydrogen peroxide, and extract with two 10-mL portions of chloroform. Evaporate the combined chloroform extracts on a steam bath just to dryness, then dry at 80° for 1 hour: the IR absorption spectrum of a potassium bromide dispersion of the menadione so obtained exhibits maxima at the same wavelengths as that of a similar preparation of USP Menadione RS. The solid also responds to *Identification test B* under *Menadiol Sodium Diphosphate*.

B: Adjust, if necessary, a volume of Injection, equivalent to about 20 mg of menadiol sodium diphosphate, by evaporation or dilution with water, as required, to 2 mL: the solution responds to *Identification test C* under *Menadiol Sodium Diphosphate*.

Bacterial Endotoxins Test (85)—It contains not more than 25.0 USP Endotoxin Units per mg of menadiol sodium diphosphate.

pH (791): between 7.5 and 8.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of menadiol sodium diphosphate, to a 125-mL separator, and extract with three 25-mL portions of chloroform, discarding the chloroform extracts. Transfer the aqueous solution to a 250-mL beaker, add 25 mL of glacial acetic acid and 25 mL of 3 N hydrochloric acid, vigorously bubble nitrogen through this solution for not less than 15 minutes, and titrate with 0.01 N ceric sulfate VS, determining the endpoint potentiometrically using a calomel-platinum electrode system. Each mL of 0.01 N ceric sulfate is equivalent to 2.651 mg of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$.

Menadiol Sodium Diphosphate Tablets

» Menadiol Sodium Diphosphate Tablets contain not less than 95.0 percent and not more than 110.0 percent of the labeled amount of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Menadione RS

Identification—

A: Triturate a quantity of powdered Tablets, equivalent to about 100 mg of menadiol sodium diphosphate, with a mixture of 10 mL of water and 10 mL of 2 N sulfuric acid, centrifuge the mixture, and filter the supernatant. To the filtrate add 1 mL of 0.5 N ceric sulfate, mix, extract with 10 mL of chloroform, and centrifuge. Evaporate the chloroform extract on a steam bath just to dryness, then dry at 80° for 1 hour: the IR absorption spectrum of a potassium bromide dispersion of the menadione so obtained exhibits maxima at the same wavelengths as that of a similar preparation of USP Menadione RS.

B: To 50 mg of the menadione obtained in *Identification test A* add 5 mL of water, then add 75 mg of sodium bisulfite, and heat on a steam bath, shaking vigorously until the substance is dissolved and the solution is almost colorless. Add water to make 50 mL, and mix. To 2 mL of the solution add 2 mL of alcoholic ammonia (prepared by mixing equal volumes of alcohol and ammonium hydroxide), shake, and add 3 drops of ethyl cyanoacetate: a deep purplish blue color is produced, and, on the addition of 1 mL of sodium hydroxide solution (1 in 3), it changes to green and then to yellow.

C: Triturate a quantity of powdered Tablets, equivalent to about 20 mg of menadiol sodium diphosphate, with 10 mL

of water, centrifuge the mixture, filter the supernatant, and evaporate to a volume of about 2 mL. Add 2 drops of nitric acid and 1 mL of sulfuric acid, and heat slowly to the evolution of white fumes. Cool, cautiously dilute with water to about 10 mL, and filter if not clear. Render the filtrate slightly alkaline to litmus with 6 N ammonium hydroxide, then render it acid with nitric acid, and add to the warm solution 3 mL of ammonium molybdate TS: a yellow precipitate is formed within a few minutes.

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 900 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 227 nm on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a standard solution prepared by dissolving in the same *Medium* an accurately weighed quantity of Menadiol Sodium Diphosphate, previously dried in vacuum over phosphorus pentoxide for 4 hours, the dried sample having a known concentration determined by titration with 0.01 N ceric sulfate VS as directed in the *Assay*.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Procedure for content uniformity—[NOTE—Use low-actinic glassware.] Transfer 1 finely powdered Tablet to a glass-stoppered centrifuge tube, add 25 mL of pH 8.0 phosphate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), and shake vigorously for several minutes. Filter into a 50-mL volumetric flask, rinse the centrifuge tube, and filter with three 5-mL portions of pH 8.0 phosphate buffer, adding the rinsings to the volumetric flask, dilute with pH 8.0 phosphate buffer to volume, and mix. Dilute a portion of this solution quantitatively and stepwise, if necessary, with pH 8.0 phosphate buffer to provide a solution containing approximately 40 µg of menadiol sodium diphosphate per mL. Concomitantly determine the absorbances of this solution and of a solution of Menadiol Sodium Diphosphate, previously dried in vacuum over phosphorus pentoxide for 4 hours, in the same *Medium* having a known concentration of about 40 µg per mL, at the wavelength of maximum absorbance at about 297 nm, with a suitable spectrophotometer, using pH 8.0 phosphate buffer as the blank. Calculate the quantity, in mg, of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$ in the Tablet taken by the formula:

$$(TC/D)(A_U/A_S)$$

in which *T* is the labeled quantity, in mg, of menadiol sodium diphosphate in the Tablet, *C* is the concentration, in µg per mL, of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$ in the Standard solution, *D* is the concentration, in µg per mL, of menadiol sodium diphosphate in the test solution, based upon the labeled quantity per Tablet and the extent of dilution, and *A_U* and *A_S* are the absorbances of the solution from the Tablet and the standard solution, respectively.

Assay—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of menadiol sodium diphosphate, to a 250-mL beaker. Moisten the powder with a few mL of glacial acetic acid, and then add sufficient quantity of the acid to make 25 mL. Add 25 mL of 3 N hydrochloric acid and 25 mL of water, mix, and titrate with 0.01 N ceric sulfate VS, determining the endpoint potentiometrically using a calomel-platinum electrode system. Each mL of 0.01 N ceric sulfate is equivalent to 2.651 mg of $C_{11}H_8Na_4O_8P_2 \cdot 6H_2O$.

Menadione

$C_{11}H_8O_2$ 172.18
1,4-Naphthalenedione, 2-methyl-;
2-Methyl-1,4-naphthoquinone [58-27-5].

DEFINITION

Menadione contains NLT 98.5% and NMT 101.0% of menadione ($C_{11}H_8O_2$), calculated on the dried basis.

[CAUTION—Menadione powder is irritating to the respiratory tract and to the skin, and a solution of it in alcohol is a vesicant.]

IDENTIFICATION

A. INFRARED ABSORPTION (197K)

B. ULTRAVIOLET ABSORPTION (197U)

Standard solution: 5 μ g/mL of USP Menadione RS in alcohol

Sample solution: 5 μ g/mL in alcohol

Analytical wavelength: 250 nm

Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

PROCEDURE

Sample solution: Transfer about 150 mg of Menadione into a 150-mL volumetric flask. Add 15 mL each of glacial acetic acid and 3 N hydrochloric acid, and rotate the flask until Menadione is dissolved. Add about 3 g of zinc dust, and close the flask with a stopper bearing a Bunsen valve. Shake, and allow to stand in the dark for 1 h, with frequent shaking. Rapidly decant the solution through a pledget of cotton into another flask, immediately wash the reduction flask with three 10-mL portions of freshly boiled and cooled water, and add 0.1 mL of orthophenanthroline TS.

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N ceric sulfate VS

Endpoint detection: Potentiometric

Analysis: Immediately titrate the combined filtrate and washings with *Titrant*. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N ceric sulfate is equivalent to 8.609 mg of menadione ($C_{11}H_8O_2$).

Acceptance criteria: 98.5%–101.0% on the dried basis

IMPURITIES

RESIDUE ON IGNITION (281): NMT 0.1%

ORDINARY IMPURITIES (466)

Standard solution and Sample solution: Methanol

Eluant: Chloroform

Visualization: 1

Acceptance criteria: Meets the requirements

SPECIFIC TESTS

MELTING RANGE OR TEMPERATURE, Class I (741):

105°–107°

LOSS ON DRYING (731)

Analysis: Dry over silica gel for 4 h.

Acceptance criteria: NMT 0.3%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

USP REFERENCE STANDARDS (11)

USP Menadione RS

Menadione Injection

» Menadione Injection is a sterile solution of Menadione in oil. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of $C_{11}H_8O_2$.

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Menadione RS

Bacterial Endotoxins Test (85)—It contains not more than 58.3 USP Endotoxin Units per mg of menadione.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—[NOTE—Avoid exposing Menadione and its solutions to light throughout the Assay.]

Standard preparation—Transfer about 25 mg of USP Menadione RS, accurately weighed, to a 100-mL volumetric flask, dissolve in a mixture of equal volumes of alcohol and ether, dilute with the same mixture to volume, and mix. Keep the solution tightly closed in a dark, cool place, and use it within 7 days.

Assay preparation—Transfer an accurately measured volume of Injection, equivalent to about 25 mg of menadione, to a 100-mL volumetric flask, dilute with a mixture of equal volumes of ether and alcohol to volume, and mix.

Procedure—Transfer 1.0 mL each of the *Standard preparation* and the *Assay preparation* to separate 50-mL volumetric flasks, add to each 4 mL of alcohol, and mix. Then to each flask add 1.0 mL of a solution prepared by dissolving 50 mg of 2,4-dinitrophenylhydrazine in 20 mL of a mixture of 2 volumes of 3 N hydrochloric acid and 1 volume of water. Place the flasks in a bath maintained at 70° to 75° for 15 minutes, shaking vigorously every 2 to 3 minutes. Immediately after the heating, cool the flasks to about 25°; then add to each 5 mL of alcoholic ammonia, prepared by mixing equal volumes of alcohol and ammonium hydroxide. Shake the flasks thoroughly, add alcohol to make 50.0 mL, mix, allow to stand for 15 minutes, and decant from any separated oil. Determine the absorbances of the solutions, in 1-cm cells at the wavelength of maximum absorbance at about 635 nm, with a suitable spectrophotometer, using a reagent blank to set the instrument. Calculate the quantity, in mg, of $C_{11}H_8O_2$ in each mL of the Injection taken by the formula:

$$(0.1C / V)(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Menadione RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Menthol

$C_{10}H_{20}O$ 156.27
Cyclohexanol, 5-methyl-2-(1-methylethyl)- [1490-04-6].

DEFINITION

Menthol is an alcohol obtained from oils derived from a variety of mints or prepared synthetically. Menthol may be levorotatory (*l*-menthol) from natural or synthetic sources, or racemic (*dl*-menthol). It contains NLT 98.0% and NMT 102.0% of menthol ($C_{10}H_{20}O$).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the menthol peak of the *Standard solution*, as obtained in the *Assay*.
- **B.** It meets the requirements in *Specific Tests for Optical Rotation* (781S), *Specific Rotation*.

ASSAY

PROCEDURE

Internal standard solution: 0.5 mg/mL of anethole in hexanes

Standard solution: 0.5 mg/mL of USP Menthol RS in *Internal standard solution*

Sample solution: 0.5 mg/mL of Menthol in *Internal standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm \times 30-m fused silica; coated with a 1- μ m layer of G16 stationary phase

Temperatures

Injection port: 250°

Detector: 250°

Column: 130° (isothermal)

Carrier gas: Helium

Flow rate: 10 mL/min

Injection volume: 1 μ L

Injection type: Split ratio of 10:1

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for menthol and anethole are about 0.5 and 1.0, respectively.]

Suitability requirements

Tailing factor: NMT 2.0 for the menthol peak

Relative standard deviation: NMT 2.0% for the peak response ratio of menthol to anethole in replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of menthol ($C_{10}H_{20}O$) in the portion of Menthol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of menthol to anethole from the *Sample solution*

R_S = peak response ratio of menthol to anethole from the *Standard solution*

C_S = concentration of USP Menthol RS in the *Standard solution* (mg/mL)

C_U = concentration of Menthol in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

LIMIT OF NONVOLATILE RESIDUE

Analysis: Evaporate 2 g, accurately weighed, in a tared open porcelain dish on a steam bath, and dry the residue at 105° for 1 h.

Acceptance criteria: NMT 0.05%

RELATED COMPOUNDS

Internal standard solution, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Sample solution: 5 mg/mL of Menthol in hexanes

Analysis

Sample: *Sample solution*

Calculate the percentage of each individual impurity in the portion of Menthol taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the responses of all the peaks from the *Sample solution*

Acceptance criteria

Individual impurities: NMT 0.3%

Total impurities: NMT 2.0%

READILY OXIDIZABLE SUBSTANCES IN *dl*-MENTHOL

Sample solution: Place 500 mg of *dl*-menthol in a clean, dry test tube, and add 10 mL of a solution of potassium permanganate, prepared by diluting 3 mL of 0.1 N potassium permanganate with water to 100 mL.

Analysis: Place the test tube in a beaker with water at a temperature between 45° and 50°. Remove the tube from the bath at intervals of 30 s, and mix quickly by shaking.

Acceptance criteria: The purple color of potassium permanganate is still apparent after 5 min.

SPECIFIC TESTS

CONGEALING RANGE OF *dl*-MENTHOL

(See *Congeeing Temperature* (651).)

[NOTE—Perform this test preferably in a room having a temperature below 30° and a relative humidity below 50%.]

Sample: 10 g of *dl*-menthol, previously dried in a desiccator over silica gel for 24 h

Analysis: Place the *Sample* in a dry test tube having an internal diameter of 18–20 mm, and melt the contents at a temperature of about 40°. Suspend the test tube in water having a temperature of 23°–25°, and stir the contents of the tube continually with a thermometer, keeping the bulb of the thermometer immersed in the liquid.

Acceptance criteria: *dl*-Menthol congeals at a temperature between 27° and 28°. Shortly after the temperature has stabilized at the congealing point, add a few mg of dried *dl*-menthol to the congealed mass, and continue stirring. After a few min, the temperature of the mass quickly rises to 30.5°–32.0°.

MELTING RANGE OF *l*-MENTHOL

(See *Melting Range or Temperature* (741).)

Acceptance criteria: 41°–44°

OPTICAL ROTATION (781S), *Specific Rotation*

Sample solution: 100 mg/mL in alcohol

Acceptance criteria

l-Menthol: –45° to –51°

dl-Menthol: –2° to +2°

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, preferably at controlled room temperature.

• **LABELING:** Label it to indicate whether it is levorotatory or racemic.

- **USP REFERENCE STANDARDS (11)**
USP Menthol RS

Menthol Lozenges

DEFINITION

Menthol Lozenges contain NLT 90.0% and NMT 125.0% of the labeled amount of menthol ($C_{10}H_{20}O$), in a suitable molded base.

IDENTIFICATION

- **A.** The retention time of the menthol peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 250 mg/mL of sodium chloride in water
Internal standard solution: 2 mg/mL of anethole in hexanes

Standard solution: 0.20L mg/mL of USP Menthol RS in *Internal standard solution*, where *L* is the labeled quantity, in mg, of menthol in each Lozenge

Sample solution: Transfer 20 Lozenges to a 1-L screw-capped conical flask. [NOTE—Use caps with inert white rubber liners.] Add 200 mL of water, 260 mL of *Solution A*, and 100.0 mL of the *Internal standard solution*, and shake by mechanical means for 30 min. Allow the phases to separate, and transfer a portion of the hexanes phase to a suitable container.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm \times 30-m fused silica; coated with a 1- μ m layer of G16 stationary phase

Temperatures

Column: 125° (isothermally)

Injection port: 250°

Detector: 250°

Carrier gas: Helium

Flow rate: 10 mL/min

Injection volume: 1 μ L

Injection type: Split ratio of 10:1

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for menthol and anethole are about 0.5 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 15 between menthol and anethole

Tailing factor: NMT 2.0 for menthol and anethole

Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of menthol ($C_{10}H_{20}O$) in the portion of Lozenges taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of the menthol to the anethole from the *Sample solution*

R_S = peak response ratio of the menthol to the anethole from the *Standard solution*
 C_S = concentration of USP Menthol RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of menthol in the hexanes phase of the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–125.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Menthol RS

Meperidine Hydrochloride

$C_{15}H_{21}NO_2 \cdot HCl$ 283.79
4-Piperidinecarboxylic acid, 1-methyl-4-phenyl-, ethyl ester, hydrochloride;
Ethyl 1-methyl-4-phenylisopiecotate hydrochloride [50-13-5].

DEFINITION

Meperidine Hydrochloride contains NLT 98.0% and NMT 102.0% of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181):**
Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Chloride (191)**
Sample solution: 10 mg/mL
Acceptance criteria: Meets the requirements
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: Transfer about 6.8 g of monobasic potassium phosphate to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume. Add 10 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 7.0, and filter.

Mobile phase: Acetonitrile and *Solution A* (550:450), filtered and degassed

Standard stock solution: 0.6 mg/mL of USP Meperidine Hydrochloride RS in water

Standard solution: 0.12 mg/mL of USP Meperidine Hydrochloride RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: 0.6 mg/mL of Meperidine Hydrochloride in water

Sample solution: 0.12 mg/mL of Meperidine Hydrochloride from the *Sample stock solution* in *Mobile phase*

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitabilitySample: *Standard solution***Suitability requirements**

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 2 for the meperidine peak

Relative standard deviation: NMT 2%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$) in the portion of Meperidine Hydrochloride taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of meperidine from the *Sample solution*

r_s = peak response of meperidine from the *Standard solution*

C_s = concentration of USP Meperidine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = concentration of Meperidine Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

OTHER COMPONENTS**• CONTENT OF CHLORIDE**

Sample solution: Transfer about 500 mg of Meperidine Hydrochloride, previously dried, to a 250-mL conical flask. Add 15 mL of water, 5 mL of glacial acetic acid, 50 mL of methanol, and 0.2 mL of eosin Y TS.

Analysis: Titrate the *Sample solution* with 0.1 N silver nitrate VS to a rose-colored endpoint. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride.

Acceptance criteria: 12.2%–12.7% of chloride is found.

Tailing factor: NMT 2

Relative standard deviation: NMT 2%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of the labeled amount of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$) in the portion of Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Meperidine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of meperidine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

- **PH (791):** 3.5–6.0
- **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 2.4 USP Endotoxin Units/mg of meperidine hydrochloride.
- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Meperidine Hydrochloride RS

Meperidine Hydrochloride Oral Solution

DEFINITION

Meperidine Hydrochloride Oral Solution contains NLT 95.0% and NMT 105.0% of the labeled amount of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).

IDENTIFICATION

- **A.**
Sample solution: Transfer a volume of Oral Solution nominally equivalent to about 100 mg of meperidine hydrochloride to a 125-mL separator. Add 40 mL of water and 3 mL of 1 N sodium hydroxide, and extract with three 25-mL portions of *n*-hexane. Wash the combined extracts with two 20-mL portions of water, discard the water, and then extract with three 25-mL portions of 0.1 N hydrochloric acid. Transfer the extracts to a 100-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.
Standard solution: Prepare in a way similar to that for the *Sample solution*, using USP Meperidine Hydrochloride RS.
Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as those of the *Standard solution*.

ASSAY

• PROCEDURE

- Sample solution:** Transfer a suitable volume of Oral Solution nominally equivalent to about 250 mg of meperidine hydrochloride to a separator, and add 3 mL of 1 N sodium hydroxide. Extract with five 20-mL portions of chloroform, and filter the extracts through a pledget of cotton into a 250-mL conical flask. Wash the cotton with 5 mL of chloroform, and add the washing to the combined filtrates. Add 10 mL of glacial acetic acid and 2 drops of crystal violet TS.
Analysis: Titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 28.38 mg of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).
Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME (698):** Meets the requirements for oral solution packaged in multiple-unit containers

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for oral solution packaged in single-unit containers

SPECIFIC TESTS

- **PH (791):** 3.5–4.1

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Meperidine Hydrochloride RS

Meperidine Hydrochloride Tablets

DEFINITION

Meperidine Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$).

IDENTIFICATION

• A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)

Sample solution: Transfer an amount nominally equivalent to about 50 mg of meperidine hydrochloride from powdered Tablets to a separator, add 10 mL of water, and shake. Add 5 mL of saturated sodium chloride solution and 1 mL of sodium hydroxide solution (1 in 25). Extract with three 20-mL portions of chloroform, filtering the extracts through cotton overlaid with anhydrous sodium sulfate. Evaporate the chloroform on a steam bath, and dissolve the residue in 4 mL of carbon disulfide.

Standard solution: In a second separator, proceed as directed in the *Sample solution*, using 50 mg of USP Meperidine Hydrochloride RS.

Analysis: Proceed as directed in the chapter, beginning with "Determine the absorption spectra".

Acceptance criteria: Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: Transfer about 6.8 g of monobasic potassium phosphate to a 1000-mL volumetric flask. Dissolve in and dilute with water to volume. Add 10 mL of triethylamine, and mix. Adjust with phosphoric acid to a pH of 7.0, and filter.

Mobile phase: Acetonitrile and *Solution A* (550:450), filtered and degassed

Standard stock solution: 0.6 mg/mL of USP Meperidine Hydrochloride RS in water

Standard solution: 0.12 mg/mL of USP Meperidine Hydrochloride RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: Transfer an amount nominally equivalent to about 60 mg of meperidine hydrochloride from NLT 20 finely powdered Tablets to a 100-mL volumetric flask. Add about 70 mL of *Mobile phase*, and sonicate for 10 min with occasional shaking. Shake by mechanical means for about 30 min, dilute with *Mobile phase* to volume, mix, and filter.

Sample solution: Nominally equivalent to 0.12 mg/mL of meperidine hydrochloride in *Mobile phase* from the *Sample stock solution*

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 3.9-mm × 30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitabilitySample: *Standard solution***Suitability requirements**

Column efficiency: NLT 2000 theoretical plates

Tailing factor: NMT 2 for the meperidine peak

Relative standard deviation: NMT 2%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of meperidine hydrochloride ($C_{15}H_{21}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response of meperidine from the *Sample solution* r_S = peak response of meperidine from the *Standard solution* C_S = concentration of USP Meperidine Hydrochloride RS in the *Standard solution* (mg/mL) C_U = nominal concentration of meperidine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

Medium: Water; 500 mL

- **USP REFERENCE STANDARDS (11)**
USP Mephenytoin RS

Mephobarbital

$C_{13}H_{14}N_2O_3$ 246.26
2,4,6-(1H,3H,5H)-Pyrimidinetrione, 5-ethyl-1-methyl-5-phenyl-;
5-Ethyl-1-methyl-5-phenylbarbituric acid [115-38-8].

DEFINITION

Mephobarbital contains NLT 98.0% and NMT 100.5% of mephobarbital ($C_{13}H_{14}N_2O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**

- **B.**

Sample: 200 mg of Mephobarbital

Analysis: Boil the *Sample* with 10 mL of 1 N sodium hydroxide.

Acceptance criteria: Ammonia is evolved.

- **C.**

Diluent: Sodium hydroxide solution (1 in 500)

Sample solution: 12 mg/mL of Mephobarbital prepared as follows. Shake about 60 mg of Mephobarbital with 5 mL of *Diluent*, and filter. Use the filtrate.

Analysis 1: Add 3 drops of mercuric nitrate TS to 1 mL of the *Sample solution*.

Acceptance criteria 1: A white precipitate is formed, and it is soluble in 6 N ammonium hydroxide.

Analysis 2: Add silver nitrate TS to 1 mL of the *Sample solution*.

Acceptance criteria 2: A white precipitate is formed, and it dissolves readily in 6 N ammonium hydroxide.

ASSAY

- **PROCEDURE**

Sample solution: 10 mg/mL of Mephobarbital in dimethylformamide

Analysis: Transfer 50 mL of *Sample solution* to a 200-mL flask. Add 4 drops of thymolphthalein TS. Titrate with 0.1 N lithium methoxide in toluene VS using a magnetic stirrer and a cover for the flask to protect against atmospheric carbon dioxide. Perform a blank determination. Each mL of 0.1 N lithium methoxide is equivalent to 24.63 mg of mephobarbital ($C_{13}H_{14}N_2O_3$).

Acceptance criteria: 98.0%–100.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

SPECIFIC TESTS

- **LOSS ON DRYING (731)**

Analysis: Dry a sample at 105° for 4 h.

Acceptance criteria: NMT 1.0%

- **MELTING RANGE OR TEMPERATURE, Class I (741):** 176°–181°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**
USP Mephobarbital RS

Mephobarbital Tablets

DEFINITION

Mephobarbital Tablets contain NLT 95.0% and NMT 110.0% of the labeled amount of mephobarbital ($C_{13}H_{14}N_2O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION—GENERAL (197M)**
Sample: Residue obtained in the Assay
Acceptance criteria: The infrared absorption spectrum of Sample is consistent with that of USP Mephobarbital RS.
- **B. MELTING RANGE OR TEMPERATURE (741)**
Sample: Residue obtained in the Assay
Acceptance criteria: 174°–181°

ASSAY

• PROCEDURE

Sample: Weigh a suitable number of powdered Tablets (NLT 20), and transfer an accurately weighed portion of powder, equivalent to 300 mg of mephobarbital, to a suitable extraction thimble. Extract with 15 mL of hexane, allow the thimble to drain, transfer to a continuous-extraction apparatus provided with a tared flask, and extract the mephobarbital with chloroform for 2 h. Evaporate the chloroform on a steam bath with the aid of a current of air, and cool.

Analysis: Dissolve the residue in 10 mL of alcohol, and evaporate. Dry the residue at 105°; for 1 h, cool, and weigh. The weight of the residue represents the weight of mephobarbital ($C_{13}H_{14}N_2O_3$) in the portion of Tablets taken.

Acceptance criteria: 95.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Buffer: 1 L of 1% of 3-(dodecyldimethylammonio) propanesulfonate in pH 8.0 phosphate buffer prepared as follows. Transfer 10.0 g of 3-(dodecyldimethylammonio) propanesulfonate in 400 mL of warm water, and add 250 mL of 0.2 M monobasic potassium phosphate and about 220 mL of 0.2 M sodium hydroxide. Cool to room temperature, adjust with 0.2 M sodium hydroxide to a pH of 8.0, dilute with water to 1000 mL, mix, and degas.

Medium: Buffer; 900 mL

Apparatus 2: 75 rpm

Time: 75 min

Standard solution: Known concentration of USP Mephobarbital RS in Medium

Sample solution: Pass a portion of the solution through a nylon filter of 0.45- μ m pore size, and, if necessary, suitably dilute with Medium.

Instrumental conditions

Mode: UV

Analytical wavelength: 244 nm

Analysis

Samples: Standard solution and Sample solution

Tolerances: NLT 70% (Q) of the labeled amount of mephobarbital ($C_{13}H_{14}N_2O_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS, Content Uniformity (905)**
Prepare all of the solutions concomitantly.

Diluent: 6.2 g of boric acid and 7.45 g of potassium chloride in 500 mL of water. Add 210 mL of sodium hydroxide solution (1 in 25). Add water to make 2000 mL of Diluent.

Standard stock solution: 10 mg/mL of USP Mephobarbital RS in Diluent

Standard solution: 1.5 mg/mL of USP Mephobarbital RS in water from Standard stock solution

Sample solution: Nominally 1.5 mg/mL of mephobarbital prepared as follows. Transfer 1 Tablet to a glass-stoppered centrifuge tube, crush the Tablet, and add 25.0 mL of Diluent. Insert the stopper, shake for 10 min, and, if necessary, centrifuge until clear, filtering the supernatant. Dilute a portion of the subsequent liquid with water.

Instrumental conditions

Mode: UV

Analytical wavelength: 245 nm

Cell: 1 cm

Blank: Diluent and water (1:3)

Analysis

Samples: Standard solution and Sample solution

Transfer 3.0 mL each of the Standard solution and the Sample solution to separate 200-mL volumetric flasks, and dilute each with Blank to volume.

Determine the percentage of the labeled amount of mephobarbital ($C_{13}H_{14}N_2O_3$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the Sample solution

A_S = absorbance of the Standard solution

C_S = concentration of the USP Mephobarbital RS in the Standard solution (mg/mL)

C_U = nominal concentration of mephobarbital in the Sample solution (mg/mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Mephobarbital RS

Mepivacaine Hydrochloride

$C_{15}H_{22}N_2O \cdot HCl$ 282.81
2-Piperidinecarboxamide, N-(2,6-dimethylphenyl)-1-methyl-, monohydrochloride, (\pm);
(\pm)-1-Methyl-2',6'-pipecoloxylidide monohydrochloride [1722-62-9].

DEFINITION

Mepivacaine Hydrochloride contains NLT 98.0% and NMT 102.0% of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride (191)**
Sample solution: 10 mg/mL
Acceptance criteria: Meets the requirements

Total impurities	—	0.4

^a N-(2,6-Dimethylphenyl)piperidine-2-carboxamide.

^b N-(2,6-Dimethylphenyl)picolinamide.

2,6-DIMETHYLANILINE

Prepare the *Standard solution* and *Sample solution* fresh, just before use.

Standard stock solution: 0.6 µg/mL of USP Ropivacaine Related Compound A RS in 1 N hydrochloric acid. [NOTE—Ropivacaine related compound A is 2,6-dimethylaniline hydrochloride.]

Standard solution: Transfer 2.0 mL of the *Standard stock solution* and 1.0 mL of 3 N sodium hydroxide to a 20-mL headspace vial, and immediately close the vial with a cap.

Sample stock solution: 30 mg/mL of Mepivacaine Hydrochloride in 1 N hydrochloric acid

Sample solution: Transfer 2.0 mL of the *Sample stock solution* and 1.0 mL of 3 N sodium hydroxide to a 20-mL headspace vial, and immediately close the vial with a cap.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 0.53-mm × 30-m capillary; coated with 3-µm film of G43

Temperatures

Injection port: 225°

Detector: 250°

Column: See Table 2.

Table 2

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
130	10	230	5

Carrier gas: Helium
 Flow rate: 4 mL/min
 Injection type: Split ratio, 1:1
 Headspace sampler
 Equilibration time: 15 min
 Equilibration temperature: 90°
 Loop temperature: 215°
 Transfer line temperature: 220°
 Vial pressure: About 15 psi
 Loop size: 3 mL
 System suitability
 Sample: *Standard solution*
 Suitability requirements
 Tailing factor: NMT 2.0
 Relative standard deviation: NMT 15%

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the quantity, in ppm, of 2,6-dimethylaniline in the portion of Mepivacaine Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 10^6$$

r_U = peak response of 2,6-dimethylaniline from the *Sample solution*

r_S = peak response of 2,6-dimethylaniline from the *Standard solution*

C_S = concentration of USP Ropivacaine Related Compound A RS in the *Standard solution* (µg/mL)

C_U = concentration of Mepivacaine Hydrochloride in the *Sample solution* (µg/mL)

M_{r1} = molecular weight of 2,6-dimethylaniline, 121.18

M_{r2} = molecular weight of 2,6-dimethylaniline hydrochloride (ropivacaine related compound A), 157.64

Acceptance criteria: NMT 20 ppm

SPECIFIC TESTS• **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 4 h.

Acceptance criteria: NMT 1.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Bupivacaine Related Compound B RS
 N-(2,6-Dimethylphenyl)piperidine-2-carboxamide.

$C_{14}H_{20}N_2O$ 232.32

USP Ropivacaine Related Compound A RS

2,6-Dimethylaniline hydrochloride.

$C_8H_{11}N \cdot HCl$ 157.64

Mepivacaine Hydrochloride Injection**DEFINITION**

Mepivacaine Hydrochloride Injection is a sterile solution of Mepivacaine Hydrochloride in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$).

IDENTIFICATION

• **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES** (181): Meets the requirements

• **B. Analysis:** Extract a volume of Injection, equivalent to 200 mg of mepivacaine, with two 10-mL portions of ether, and discard the ether extracts. Render the remaining solution slightly alkaline with sodium carbonate

TS, and extract the precipitate with ether. Evaporate the ether extract on a steam bath to dryness, and dry the residue under vacuum at 60° for 1 h.

Acceptance criteria: The mepivacaine obtained melts between 149° and 153°.

ASSAY• **PROCEDURE**

Buffer: 3.40 g/L of monobasic potassium phosphate and 4.35 g/L of dibasic potassium phosphate in water. Adjust with potassium hydroxide or phosphoric acid to a pH of 6.3.

Mobile phase: Acetonitrile and *Buffer* (35:65)

System suitability solution: 0.05 mg/mL of methylparaben and 1.0 mg/mL of USP Mepivacaine Hydrochloride RS in *Mobile phase*

Standard solution: 1.0 mg/mL of USP Mepivacaine Hydrochloride RS in *Mobile phase*

Sample solution: Nominally 1 mg/mL of mepivacaine hydrochloride from Injection in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 263 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1[†]

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 10 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for mepivacaine and methylparaben are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methylparaben and mepivacaine, *System suitability solution*

Capacity factor: NLT 1.0 for the mepivacaine peak, *System suitability solution*

Tailing factor: NMT 2.0 for the mepivacaine peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$) in the volume of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Mepivacaine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

SPECIFIC TESTS

• **pH** (791): 4.5–6.8

• **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 0.8 USP Endotoxin Unit/mg of mepivacaine hydrochloride.

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Injection labeled to contain 2% or less of mepivacaine hydrochloride may be packaged in 50-mL multiple-dose containers.

[†] A Whatman Partisphere RTF C18 brand of L1 column has been shown to be an appropriate column.

• **USP REFERENCE STANDARDS (11)**

- USP Endotoxin RS
- USP Mepivacaine Hydrochloride RS

Mepivacaine Hydrochloride and Levonordefrin Injection

DEFINITION

Mepivacaine Hydrochloride and Levonordefrin Injection is a sterile solution of Mepivacaine Hydrochloride and Levonordefrin in Water for Injection. It contains NLT 95.0% and NMT 105.0% of the labeled amount of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$) and NLT 90.0% and NMT 110.0% of the labeled amount of levonordefrin ($C_9H_{13}NO_3$).

IDENTIFICATION

- A.**
Analysis: Extract a volume of Injection, equivalent to 200 mg of mepivacaine, with two 10-mL portions of ether, and discard the ether extracts. Render slightly alkaline with sodium carbonate TS, extract the precipitate with ether, evaporate the ether extract on a steam bath to dryness, and dry the residue under vacuum at 60° for 1 h.
Acceptance criteria: The mepivacaine obtained melts between 149° and 153°.
- B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

ASSAY

• MEPIVACAINE HYDROCHLORIDE

Buffer: 3.40 g/L of monobasic potassium phosphate and 4.35 g/L of dibasic potassium phosphate in water. Adjust with potassium hydroxide or phosphoric acid to a pH of 6.3.

Mobile phase: Acetonitrile and Buffer (35:65)

System suitability solution: 0.05 mg/mL of methylparaben and 1.0 mg/mL of USP Mepivacaine Hydrochloride RS in Mobile phase

Standard solution: 1.0 mg/mL of USP Mepivacaine Hydrochloride RS in Mobile phase

Sample solution: Nominally 1 mg/mL of mepivacaine hydrochloride from Injection in Mobile phase

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 263 nm

Column: 4.6-mm × 25-cm; 5-μm packing L1¹

Column temperature: 40°

Flow rate: 1 mL/min

Injection volume: 10 μL

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for mepivacaine and methylparaben are 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 2.0 between methylparaben and mepivacaine, System suitability solution

Capacity factor: NLT 1.0 for the mepivacaine peak, System suitability solution

Tailing factor: NMT 2.0 for the mepivacaine peak, System suitability solution

Relative standard deviation: NMT 2.0%, Standard solution

Analysis

Samples: Standard solution and Sample solution
 Calculate the percentage of the labeled amount of mepivacaine hydrochloride ($C_{15}H_{22}N_2O \cdot HCl$) in the volume of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the Sample solution
- r_S = peak response from the Standard solution
- C_S = concentration of USP Mepivacaine Hydrochloride RS in the Standard solution (mg/mL)
- C_U = nominal concentration of mepivacaine hydrochloride in the Sample solution (mg/mL)

Acceptance criteria: 95.0%–105.0%

• LEVONORDEFRIN

Ferro-citrate solution and Buffer solution: Prepare as directed in Epinephrine Assay (391).

Standard stock solution: With the aid of 20 mL of sodium bisulfite solution (1 in 50), transfer 25 mg of USP Levonordefrin RS to a 50-mL volumetric flask, and dilute with water to volume.

Standard solution: 50 μg/mL of USP Levonordefrin RS in sodium bisulfite solution (1 in 500) from the Standard stock solution. Make the final dilution at the time the Assay is to be carried out.

Sample solution: Nominally 50 μg/mL of levonordefrin from Injection, diluting if necessary

Analysis: Proceed as directed in Epinephrine Assay (391), except use levonordefrin wherever epinephrine [base] is called for. When the Ferro-citrate solution and the Buffer solution are mixed with the Sample solution, a fine precipitate may be formed. Remove this precipitate by centrifugation or by passing through dry filter paper before the colorimetric measurements are taken.

Calculate the percentage of the labeled amount of levonordefrin ($C_9H_{13}NO_3$) in the volume of Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- A_U = absorbance of the Sample solution
- A_S = absorbance of the Standard solution
- C_S = concentration of USP Levonordefrin RS in the Standard solution (μg/mL)
- C_U = nominal concentration of levonordefrin in the Sample solution (μg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• COLOR AND CLARITY

Standard solution: Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, and dilute with water to volume.

Analysis

Samples: Standard solution and Sample solution

Visually examine a portion of the Injection (Sample solution) in a suitable clear glass test tube against a white background: it is not pinkish, and it contains no precipitate. If any yellow color is observed in the Sample solution, concomitantly determine the absorbances of the Sample solution and Standard solution in 1-cm cells with a suitable spectrophotometer set at 460 nm.

Acceptance criteria: The absorbance of the Sample solution does not exceed that of the Standard solution.

• PH (791): 3.3–5.5

• **BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.8 USP Endotoxin Unit/mg of mepivacaine hydrochloride.

• **OTHER REQUIREMENTS:** It meets the requirements in Injections and Implanted Drug Products (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

¹ A Whatman Partisphere RTF C18 brand of L1 column has been shown to be an appropriate column.

- **LABELING:** The label indicates that the Injection is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.
- **USP REFERENCE STANDARDS (11)**
 - USP Endotoxin RS
 - USP Levonordefrin RS
 - USP Mepivacaine Hydrochloride RS

Meprednisone

$C_{22}H_{28}O_5$ 372.45
 Pregna-1,4-diene-3,11,20-trione, 17,21-dihydroxy-16-methyl-, (16 β)-;
 17,21-Dihydroxy-16 β -methylpregna-1,4-diene-3,11,20-trione [1247-42-3].

DEFINITION

Meprednisone contains NLT 97.5% and NMT 102.5% of meprednisone ($C_{22}H_{28}O_5$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197M)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
 Analytical wavelength: 238 nm
 Standard solution: 10 μ g/mL of USP Meprednisone RS in methanol
 Sample solution: 10 μ g/mL in methanol
 Acceptance criteria: Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.
- **C. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
 Diluent: Toluene and alcohol (1:1)
 Sample solution: 20 mg/mL in Diluent
 Chromatographic system
 Spray reagent: 10% (v/v) sulfuric acid in alcohol
 Analysis: Proceed as directed in the chapter. Locate the spots on the plate by spraying with *Spray reagent* and heating at 105° for 10 min.
 Acceptance criteria: Meets the requirements

ASSAY

PROCEDURE

Diluent: Alcohol and chloroform (1:1)
 Standard solution: Prepare as directed in *Single-Steroid Assay* (511), *Standard Preparation* using USP Meprednisone RS.
 Sample solution: 2 mg/mL of previously dried Meprednisone in Diluent
 Instrumental conditions
 Mode: UV
 Analytical wavelength: Maximum at about 238 nm
 Cell: 1 cm
 Analysis
 Samples: *Standard solution* and *Sample solution*
 Proceed as directed in *Single-Steroid Assay* (511), *Procedure* using a solvent system consisting of chloroform, methanol, and water (180:15:1), through the fourth sentence of the second paragraph. Then centrifuge the tubes for 5 min. Determine the absorbances of the supernatants against a blank.
 Calculate the percentage of meprednisone ($C_{22}H_{28}O_5$) in the portion of Meprednisone taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of USP Meprednisone RS in the *Standard solution* (mg/mL)
 C_U = concentration of the *Sample solution* (mg/mL)
 Acceptance criteria: 97.5%–102.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%

SPECIFIC TESTS

- **LOSS ON DRYING (731)**
 Analysis: Dry at 105° for 3 h.
 Acceptance criteria: NMT 1.0%
- **OPTICAL ROTATION, Specific Rotation (781S)**
 Sample solution: 10 mg/mL in dioxane
 Acceptance criteria: +180° to +188°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS (11)**
 USP Meprednisone RS

Meprobamate

$C_9H_{18}N_2O_4$ 218.25
 1,3-Propanediol, 2-methyl-2-propyl-, dicarbamate;
 2-Methyl-2-propyl-1,3-propanediol dicarbamate [57-53-4].

DEFINITION

Meprobamate contains NLT 97.0% and NMT 101.0% of meprobamate ($C_9H_{18}N_2O_4$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
 Sample: 1 mg in 200 mg
 Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the *Sample*, previously dried, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Meprobamate RS. If a difference appears, dissolve portions of both the *Sample* and the Reference Standard in acetone at a concentration of 8 mg/mL. Dilute 0.1-mL portions of the acetone solutions with 1 mL of *n*-heptane, and remove the solvents by evaporation under nitrogen at a temperature of 30°. Dry the residues under vacuum at room temperature for 30 min, and repeat the test on the residues.
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

PROCEDURE

Mobile phase: Acetonitrile and water (30:70)
 Standard solution: 5 mg/mL of USP Meprobamate RS prepared as follows. Dissolve the Standard first in acetonitrile using 30% of final volume. Sonicate if necessary to dissolve, and cool to room temperature. Dilute with water to volume.
 Sample solution: 5 mg/mL of Meprobamate prepared as follows. Dissolve the sample first in acetonitrile using 30% of final volume. Sonicate if necessary to dissolve, and cool to room temperature. Dilute with water to volume.

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 4.6-mm × 25-cm; 4-μm packing L1

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: 2 times the retention time of meprobamate

System suitabilitySample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*Calculate the percentage of meprobamate (C₉H₁₈N₂O₄) in the portion of Meprobamate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 r_U = peak response from the *Sample solution* r_S = peak response from the *Standard solution* C_S = concentration of USP Meprobamate RS in the *Standard solution* (mg/mL) C_U = concentration of Meprobamate in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–101.0% on the dried basis

IMPURITIES• **ORGANIC IMPURITIES: PROCEDURE 1**

Standard solutions: Dissolve USP Meprobamate RS in alcohol, and mix to obtain *Standard solution A* with a known concentration of 1.0 mg/mL. Dilute quantitatively with alcohol to obtain the *Standard solutions* with the compositions given in *Table 1*.

Table 1

Standard Solution	Dilution	Concentration (mg RS/mL)	Percentage (% for Comparison with Sample)
A	(Undiluted)	1.0	1.0
B	(4 in 5)	0.8	0.8
C	(3 in 5)	0.6	0.6
D	(2 in 5)	0.4	0.4
E	(1 in 5)	0.2	0.2

Sample solution: 100 mg/mL of Meprobamate in alcohol

Chromatographic system(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: Thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel

Application volume: 2 μL

Developing solvent system: Hexane, acetone, and pyridine (70:30:10)

Spray reagent: 5 mg/mL of vanillin in a cooled mixture of sulfuric acid and alcohol (80:20)

AnalysisSamples: *Standard solutions* and *Sample solution*

Position the plate in a chromatographic chamber, and develop the chromatograms in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry the plate for 15 min. Heat the plate at 100° for 15 min, cool, and spray with *Spray reagent*. Heat the plate at 110° for 15–20 min, cool, and allow the plate to develop blue-purple spots at room temperature. [NOTE—Color development requires about 30–60 min.] Examine the plate, and compare the in-

tensities of any secondary spots of the *Sample solution* with those of the principal spots of the *Standard solutions*.

Acceptance criteria: No secondary spot of the *Sample solution* is larger or more intense than the principal spot of *Standard solution A* (1.0%), and the sum of the intensities of all secondary spots of the *Sample solution* corresponds to NMT 2.0%.

• **ORGANIC IMPURITIES, PROCEDURE 2: LIMIT OF METHYL CARBAMATE****Standard solution:** 1.0 mg/mL of methyl carbamate

Sample solution: Transfer 1.0 g of finely powdered Meprobamate to a beaker, add 5.0 mL of water, and stir to wet the powder completely. Filter the slurry through a small plug of glass wool in the stem of a glass funnel. Use the clear filtrate.

Mobile phase: Water

Chromatographic system(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 3.9–4.6-mm × 25–30-cm; packing L1

Flow rate: 1 mL/min

Injection volume: 50 μL

System suitabilitySample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

AnalysisSamples: *Standard solution* and *Sample solution*

Acceptance criteria: The peak response of the *Sample solution* is not greater than that of the *Standard solution*, corresponding to NMT 0.5% of methyl carbamate.

SPECIFIC TESTS• **LOSS ON DRYING (731)**

Analysis: Dry a sample under vacuum at 60° for 3 h.

Acceptance criteria: NMT 0.5%

• **MELTING RANGE OR TEMPERATURE (741):** 103°–107°, but the range between the beginning and end of melting is NMT 2°.**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers.• **USP REFERENCE STANDARDS (11)**

USP Meprobamate RS

Meprobamate Oral Suspension**DEFINITION**

Meprobamate Oral Suspension contains NLT 95.0% and NMT 110.0% of the labeled amount of meprobamate (C₉H₁₈N₂O₄).

IDENTIFICATION• **A.****Sample solution:** 2 mL of Oral Suspension

Analysis: Mix the *Sample solution* with 2 mL of acetone and 2 mL of furfural in glacial acetic acid (1 in 100), add 5 mL of hydrochloric acid, and shake.

Acceptance criteria: A purple color is produced, and, on standing, it changes to blue, then to blue-black, and finally to black-brown.

ASSAY• **PROCEDURE**

Sample solution: Transfer an equivalent to 400 mg of meprobamate from Oral Suspension to a separator, and completely extract the meprobamate with 20-mL portions of chloroform, filtering the extracts through a pledget of cotton enclosed in glass wool that previously has been moistened with chloroform. Collect the filtrate

in a conical flask, add several glass beads to the flask, and evaporate on a steam bath to dryness. To the residue add 20 mL of water, heat on a steam bath for several min, then add 40 mL of hydrochloric acid, and reflux for 90 min. Remove the condenser, and continue boiling until the volume is reduced to about 20 mL. Cool to room temperature, add 50 mL of water, and cool in an ice bath. Add 1 drop of methyl red TS, and, while cooling continuously, cautiously neutralize with sodium hydroxide solution (4 in 10) until the indicator begins to change color. Add hydrochloric acid, if necessary, to restore the pink color, then carefully neutralize with 0.1 N sodium hydroxide VS. Add 30 mL of neutral formaldehyde solution (18% w/w).

Analysis: Titrate with 0.1 N sodium hydroxide VS until the solution becomes yellow. Add 0.2 mL of phenolphthalein TS, and continue the titration with 0.1 N sodium hydroxide VS to a distinct pink color. Perform a blank determination. Each mL of the total volume of 0.1 N sodium hydroxide consumed after the addition of the formaldehyde solution is equivalent to 10.91 mg of meprobamate ($C_9H_{18}N_2O_4$).

Acceptance criteria: 95.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for oral suspension packaged in single-unit containers
- **DELIVERABLE VOLUME (698):** Meets the requirements for oral suspension packaged in multiple-unit containers

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.

Meprobamate Tablets

DEFINITION

Meprobamate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of meprobamate ($C_9H_{18}N_2O_4$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: A portion of finely powdered Tablets, equivalent to 800 mg of meprobamate

Analysis: To the *Sample* add 5 mL of dehydrated alcohol, and heat to just below boiling for about 5 min, with occasional swirling. Cool, and filter into 15 mL of solvent hexane. With the aid of suction, filter the crystals that form, and dry at 60°.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion (about 1 mg in 200 mg) from a portion of crystals obtained from the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Meprobamate RS. If a difference appears, dissolve portions of both the *Sample* and the Reference Standard in acetone at a concentration of 8 mg/mL. Dilute 0.1-mL portions of the acetone solutions with 1 mL of *n*-heptane, and remove the solvents by evaporation under nitrogen at a temperature of about 30°. Dry the residues under vacuum at room temperature for 30 min, and repeat the test on the residues.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and water (30:70)

Phenacetin stock solution: 125 µg/mL of phenacetin in acetonitrile

Phenacetin solution: 25 µg/mL of phenacetin prepared as follows from the *Phenacetin stock solution*. Pipet a suitable volume of *Phenacetin stock solution* into a volumetric flask. Add acetonitrile to fill 30% of the final flask volume, and dilute with water to volume.

Standard solution: 5 mg/mL of USP Meprobamate RS prepared as follows. Transfer a suitable amount of the Reference Standard to a suitable volumetric flask. Dissolve in 30% of the final flask volume of acetonitrile, and dilute with water to volume.

System suitability solution: 5 mg/mL of USP Meprobamate RS and 5 µg/mL of phenacetin prepared as follows. Dissolve a weighed amount of USP Meprobamate RS, first in acetonitrile, using 20% final volume. Shake to dissolve. Add a suitable volume of *Phenacetin solution*, and dilute with water to volume.

Sample solution: Nominally equivalent to 5 mg/mL of meprobamate prepared as follows. Transfer an amount of meprobamate from a portion of finely powdered Tablets (NLT 20) to a suitable volumetric flask. Add acetonitrile to fill 30% of final volume, and shake to dissolve. Dilute with water to volume, and filter, discarding the first 10 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 200 nm

Column: 3.9–4.6-mm × 25–30-cm; 5-µm packing L1

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for meprobamate and phenacetin are about 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the meprobamate and the phenacetin peaks, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of meprobamate ($C_9H_{18}N_2O_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of meprobamate from the *Sample solution*

r_S = peak response of meprobamate from the *Standard solution*

C_S = concentration of USP Meprobamate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of meprobamate in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Procedure for a pooled sample

Medium: Deaerated water; 900 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution, System suitability solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Calculate the percentage of the labeled amount of meprobamate ($C_9H_{18}N_2O_4$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

- C_s = concentration of USP Meprobamate RS in the Standard solution (mg/mL)
 V = volume of the Medium, 900 mL
 L = label claim (mg/Tablet)
 Acceptance criteria: NLT 75% (Q) of the labeled amount of meprobamate ($C_9H_{18}N_2O_4$) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Meprobamate RS

Meradimate

$C_{17}H_{25}NO_2$ 275.39
 Cyclohexanol, 5-methyl-2-(1-methylethyl)-, 2-aminobenzoate;
 Anthranilic acid, *p*-menth-3-yl ester [134-09-8].

DEFINITION

Meradimate contains NLT 95.0% and NMT 105.0% of meradimate ($C_{17}H_{25}NO_2$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (177F)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
Sample solution: 5 µg/mL in alcohol
Acceptance criteria: Meets the requirements
- **C.** The retention time of the major peak of the Sample solution corresponds to that of the Standard solution, as obtained in the Assay.

ASSAY• **PROCEDURE**

Standard solution: 20.0 mg/mL of USP Meradimate RS in *tert*-butyl methyl ether

Sample solution: 20 mg/mL of Meradimate in *tert*-butyl methyl ether

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: GC

Detector: Flame ionization

Column: 0.32-mm × 25-m; coated with a 0.1-µm film of G1

Temperatures

Injector: 240°

Detector: 260°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
60	8	240	10

Carrier gas: Helium

Flow rate: 6 mL/min

Injection type: Split ratio, 30:1

[NOTE—The split ratio can be modified to optimize performance.]

Injection volume: 1 µL

System suitability

Sample: Standard solution

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of meradimate ($C_{17}H_{25}NO_2$) in the portion of Meradimate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the Sample solution

r_s = peak response from the Standard solution

C_s = concentration of USP Meradimate RS in the Standard solution (mg/mL)

C_u = concentration of the Sample solution (mg/mL)

Acceptance criteria: 95.0%–105.0%

IMPURITIES• **ORGANIC IMPURITIES**

Standard solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Analysis

Sample: Sample solution

Calculate the percentage of each impurity in the portion of Meradimate taken:

$$\text{Result} = (r_u/r_t) \times 100$$

r_u = peak response of each impurity

r_t = sum of all the peak responses

Acceptance criteria

Any individual impurity: NMT 0.5%

Total impurities: NMT 2.0%

SPECIFIC TESTS• **ACIDITY**

Sample: 5.0 mL of Meradimate

Titrimetric system

Mode: Direct titration

Titrant: 0.1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Transfer 50 mL of alcohol to a suitable container, add 1 mL of phenolphthalein TS, and add sufficient volume of Titrant to obtain a persistent pink color. Transfer 50 mL of this solution to a suitable container, add the Sample, and titrate with Titrant.

Acceptance criteria: NMT 0.2 mL of Titrant per mL of Meradimate is necessary.

• **OPTICAL ROTATION, Specific Rotation (781S):** -4° to $+4^\circ$

Sample solution: 10 mg/mL in alcohol

• **REFRACTIVE INDEX (831):** 1.540–1.544 at 20°**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS (11)**

USP Meradimate RS

Mercaptopurine

$C_5H_4N_4S \cdot H_2O$

170.19

$C_5H_4N_4S$

152.18

6H-Purine-6-thione, 1,7-dihydro-, monohydrate;
 Purine-6-thiol monohydrate [6112-76-1].

Anhydrous [50-44-2].

DEFINITION

Mercaptopurine contains NLT 97.0% and NMT 102.0% of mercaptopurine ($C_5H_4N_4S$), calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Solution A: 0.77 g/L of ammonium acetate in water
Mobile phase: Methanol and *Solution A* (25:75)

Standard stock solution: 0.2 mg/mL of USP Mercaptopurine RS in a mixture of methanol and water (1:1). Transfer USP Mercaptopurine RS into a suitable volumetric flask, and add methanol equivalent to 50% of the final volume. Shake mechanically to dissolve, and dilute with water to volume.

Standard solution: 0.02 mg/mL of USP Mercaptopurine RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: Transfer 25 mg of Mercaptopurine into a 50-mL volumetric flask. Add 25 mL of methanol, shake mechanically for at least 45 min, and dilute with water to volume. Transfer 20 mL of this solution into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume.

Sample solution: 0.02 mg/mL of Mercaptopurine in *Mobile phase* from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 325 nm

Column: 4.6-mm × 15-cm; 5-μm packing L68

SPECIFIC TESTS

• PHOSPHORUS

Standard phosphate solution: 43.96 µg/mL of dried monobasic potassium phosphate (equivalent to 10 µg of phosphorus)

Standard solution: Transfer 2 mL of *Standard phosphate solution* to a 25-mL volumetric flask. Add 1 mL of 15 N sulfuric acid, 0.5 mL of nitric acid, 0.75 mL of ammonium molybdate TS, and 1 mL of aminonaphtholsulfonic acid TS, then dilute with water to volume, and mix. Allow to stand for 5 min.

Sample solution: Digest 200 mg with 2 mL of 15 N sulfuric acid in a large test tube, periodically adding nitric acid, dropwise and with caution. Continue heating until practically all of the liquid has evaporated and the residue is colorless. Transfer the residue, with the aid of small portions of water, to a 25-mL volumetric flask. Add 1 mL of 15 N sulfuric acid, 0.5 mL of nitric acid, 0.75 mL of ammonium molybdate TS, and 1 mL of aminonaphtholsulfonic acid TS, then dilute with water to volume. Allow to stand for 5 min.

Blank: Transfer 2 mL of 15 N sulfuric acid to a large test tube, periodically adding nitric acid, dropwise and with caution. Continue heating until practically all of the liquid has evaporated and the residue is colorless. Transfer the residue, with the aid of small portions of water, to a 25-mL volumetric flask. Add 1 mL of 15 N sulfuric acid, 0.5 mL of nitric acid, 0.75 mL of ammonium molybdate TS, and 1 mL of aminonaphtholsulfonic acid TS, then dilute with water to volume. Allow to stand for 5 min.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV-Vis

Analytical wavelength: 750 nm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Acceptance criteria: The absorbance of the *Sample solution* is NMT that of the *Standard solution* (NMT 100 ppm).

• WATER DETERMINATION, Method I (921)

Medium: 30 mL of methanol and 5 g of salicylic acid in the titration vessel

Sample: 0.3 g of Mercaptopurine

Acceptance criteria: NMT 12.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light. Store at room temperature.

• **USP REFERENCE STANDARDS (11)**

USP Mercaptopurine RS

Mercaptopurine Tablets

DEFINITION

Mercaptopurine Tablets contain NLT 93.0% and NMT 110.0% of the labeled amount of mercaptopurine ($C_5H_4N_4S \cdot H_2O$).

IDENTIFICATION

• **A.** The UV absorption spectrum exhibits a maximum at 325 ± 2 nm, and the ratio A_{255}/A_{325} does not exceed 0.09.

Sample: 5 µg/mL of mercaptopurine in a mixture of methanol and water (1:1), from the *Sample solution* in the Assay

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY

• PROCEDURE

Solution A: 0.77 g/L of ammonium acetate in water

Solution B: Methanol and *Solution A* (5:95)

Solution C: Methanol and *Solution A* (30:70)

Mobile phase: *Solution B* and *Solution C* (80:20)

Diluent: Methanol and water (1:1)

Standard solution: 0.25 mg/mL of USP Mercaptopurine RS in a mixture of methanol and water (1:1). Transfer USP Mercaptopurine RS into a suitable volumetric flask, and add methanol equivalent to 50% of the final volume. Shake mechanically to dissolve, and dilute with water to volume.

Sample stock solution: 0.5 mg/mL of mercaptopurine in *Diluent* from NLT 5 Tablets. Place the Tablets into a suitable volumetric flask, add methanol equivalent to 50% of the final volume, and shake mechanically for a minimum of 30 min. Dilute with water to volume. Pass through a PVDF filter of 0.45-µm pore size, and discard the first 3 mL of filtrate.

Sample solution: 0.25 mg/mL of mercaptopurine in *Diluent* from the *Sample stock solution*

- **USP REFERENCE STANDARDS (11)**
USP Mercaptopurine RS

Ammoniated Mercury

Hg(NH₂)Cl 252.07
Mercury amide chloride [10124-48-8].

DEFINITION

Ammoniated Mercury contains NLT 98.0% and NMT 100.5% of ammoniated mercury $[\text{Hg}(\text{NH}_2)\text{Cl}]$.

IDENTIFICATION

- **A.**
Sample: 0.1 g
Analysis: Place the *Sample* in a cold solution of 1 g of sodium thiosulfate in 2 mL of water.
Acceptance criteria: The *Sample* is soluble, with the evolution of ammonia. When this solution is heated gently, a rust-colored mixture is formed, from which a red precipitate is obtained on centrifugation. If the solution is strongly heated, a black mixture forms.
- **B.**
Sample: A suitable quantity
Analysis: Heat the *Sample* with 1 N sodium hydroxide.
Acceptance criteria: The solution becomes yellow, and ammonia is evolved.
- **C.**
Sample solution: A suitable quantity in warm acetic acid
Analysis: *Sample solution* with potassium iodide TS
Acceptance criteria: The solution yields a red precipitate that is soluble in an excess of the reagent. The solution yields a white precipitate with silver nitrate TS.

ASSAY**• PROCEDURE**

Sample solution: Mix 0.25 g of Ammoniated Mercury with 10 mL of water. Add 3 g of potassium iodide, mix occasionally until dissolved, add about 40 mL of water, and add methyl red TS.

Analysis: Titrate with 0.1 N hydrochloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N hydrochloric acid is equivalent to 12.60 mg of ammoniated mercury $[\text{Hg}(\text{NH}_2)\text{Cl}]$.

Acceptance criteria: 98.0%–100.5%

IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.2%

• MERCUROS COMPOUNDS

Sample: 2.5 g

Analysis: Dissolve the *Sample* in 25 mL of warm hydrochloric acid. Pass through a tared filtering crucible, wash with water, and dry at 60° to constant weight.

Acceptance criteria: NMT 0.2%; the weight of the residue does not exceed 5 mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

Meropenem

$\text{C}_{17}\text{H}_{25}\text{N}_3\text{O}_5\text{S} \cdot 3\text{H}_2\text{O}$ 437.51

1-Azabicyclo[3.2.0]hept-2-ene-2-carboxylic acid, 3-[[5-[(dimethylamino)carbonyl]-3-pyrrolidinyl]thio]-6-(1-hydroxyethyl)-4-methyl-7-oxo, trihydrate, [4R-[3(3S*, 5S*), 4α, 5β, 6β(R*)]]-, (4R, 5S, 6S)-3-[[[(3S, 5S)-5-(Dimethylcarbamoyl)-3-pyrrolidinyl]thio]-6-[(1R)-1-hydroxyethyl]-4-methyl-7-oxo-1-azabicyclo[3.2.0]hept-2-ene-carboxylic acid, trihydrate [119478-56-7].

Anhydrous 383.47 [96036-03-2].

» Meropenem contains not less than 98.0 percent and not more than 101.0 percent of $\text{C}_{17}\text{H}_{25}\text{N}_3\text{O}_5\text{S}$, calculated on the anhydrous basis.

Packaging and storage—Preserve in tight containers. Store the dry powder at controlled room temperature.

Labeling—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

USP Reference standards (11)—

USP Endotoxin RS

USP Meropenem RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 30 µg per mL.

Medium: water.

Specific rotation (781): between −17° and −21°, measured at 20°.

Test solution: 5 mg per mL, in water.

pH (791): between 4.0 and 6.0, in a solution (1 in 100).

Water Determination, Method 1c (921): between 11.4% and 13.4%.

Residue on ignition (281): not more than 0.1%, igniting at $500 \pm 50^\circ$, instead of at $800 \pm 25^\circ$. Use a desiccator containing silica gel.

Delete the following:**• Heavy metals—**

Sodium sulfide reagent—Dissolve 5 g of sodium sulfide in a mixture of 10 mL of water and 30 mL of glycerin. Preserve in well-filled, light-resistant bottles, and use within 3 months.

Test solution—Transfer 1.0 g of Meropenem to a quartz or porcelain crucible, cover loosely with a lid, and carbonize by gentle ignition. After cooling, add 2 mL of nitric acid and 5 drops of sulfuric acid, heat cautiously until white fumes evolve, and incinerate by ignition at 500° to 600°. Cool, add 2 mL of hydrochloric acid, and evaporate on a water bath to dryness. Moisten the residue with 3 drops of hydrochloric acid, add 10 mL of hot water, and warm for 2 minutes. Add 1 drop of phenolphthalein TS, add ammonia TS, dropwise, until the solution develops a pale red color, and add 2 mL of 1 N acetic acid. Filter, if necessary, to obtain a clear solution, washing the filter with 10 mL of water. Transfer the filtrate and the washing to a 50-mL color-comparison tube, and add water to obtain a volume of 50 mL.

Standard solution—Evaporate a mixture of 2 mL of nitric acid, 5 drops of sulfuric acid, and 2 mL of hydrochloric acid on a water bath, further evaporate to dryness on a hot sand bath, and moisten the residue with 3 drops of hydrochloric acid. Proceed as directed for *Test solution*, beginning with "add 10 mL of hot water," except add water to obtain a volume of 49 mL. Add 1.0 mL of *Standard Lead Solution* (see *Heavy Metals* (231)).

Procedure—To the tubes containing the *Test solution* and the *Standard solution*, add 1 drop of *Sodium sulfide reagent*, mix, and allow to stand for 5 minutes. The color in the tube containing the *Test solution* is not darker than the color in the tube containing the *Standard solution* (0.001%). (Official 1-Jan-2018)

Limit of acetone—

Internal standard solution—Prepare a solution in dimethylformamide containing 0.05 µL of ethyl acetate per mL.

Standard solution—Transfer about 50 mg of acetone, accurately weighed, to a 100-mL volumetric flask, dilute with dimethylformamide to volume, and mix. To 1.0 mL of this

solution, add 10.0 mL of the *Internal standard solution*, and mix.

Test solution—Dissolve 100 mg of Meropenem, accurately weighed, in 0.2 mL of dimethylformamide and 2.0 mL of *Internal standard solution*.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 3-mm × 2-m column that contains support S2 and is maintained at a constant temperature of about 150°. The injection port temperature is maintained at about 170°. Nitrogen is the carrier gas, with the flow rate adjusted so that the retention time for acetone is about 3 minutes.

Procedure—Separately inject equal volumes (about 2 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for the acetone peak and the internal standard peak. Calculate the percentage of acetone in the portion of Meropenem taken by the formula:

$$(W_A/5W_U)(R_U/R_S)$$

in which W_A is the weight, in mg, of acetone in the *Standard solution*; W_U is the quantity, in mg, of Meropenem in the *Test solution*; and R_U and R_S are the peak area ratios of acetone to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 0.05% is found.

Chromatographic purity—

Diluted phosphoric acid—Dilute 10 mL of phosphoric acid with water to make 100 mL of solution.

Solvent—Transfer 1.0 mL of triethylamine to a 1000-mL volumetric flask containing 900 mL of water. Adjust with *Diluted phosphoric acid* to a pH of 5.0 ± 0.1 , dilute with water to volume, and mix.

Mobile phase—Transfer 1.0 mL of triethylamine to a 1000-mL volumetric flask containing 900 mL of water. Adjust with *Diluted phosphoric acid* to a pH of 5.0 ± 0.1 , dilute with water to volume, and mix. Mix this solution with 70 mL of acetonitrile. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Prepare a solution of USP Meropenem RS in *Solvent* having a known concentration of about 0.025 mg of USP Meropenem RS per mL. [NOTE—Immediately after preparation, store this solution in a refrigerator and use within 24 hours.]

Test solution—Dissolve an accurately weighed quantity of Meropenem quantitatively in *Solvent* to obtain a solution having a known concentration of about 5 mg per mL. Use this *Test solution* immediately.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1 and is maintained at a constant temperature of about 40°. The flow rate is about 1.6 mL per minute, and is adjusted so that the retention time of meropenem is between 5 and 7 minutes. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, using a period of chromatography for the *Test solution* that is about 3 times the retention time of meropenem, and measure the peak responses. Major impurity peaks may be observed at retention times of about 0.45 and 1.9 in relation to the retention time of meropenem. Calculate the percentage of each im-

purity in the chromatogram obtained from the *Test solution* by the formula:

$$(C_S/C_U)(P)(r_i/r_s)$$

in which C_S is the concentration, in mg per mL, of USP Meropenem RS in the *Standard solution*; C_U is the concentration, in mg per mL, of Meropenem in the *Test solution*; P is the stated percentage, calculated on the anhydrous basis, of meropenem in USP Meropenem RS; r_i is the peak response of any individual impurity obtained from the *Test solution*; and r_s is the peak response of meropenem obtained from the *Standard solution*. Not more than 0.3% of any of two major impurities is found, calculated on the anhydrous basis; not more than 0.1% of any other impurity is found, calculated on the anhydrous basis; and the sum of all such other impurities is not more than 0.3%.

Other requirements—Where the label states that Meropenem is sterile, it meets the requirements for *Sterility Tests* (71) and for *Bacterial endotoxins* under *Meropenem for Injection*. Where the label states that Meropenem must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Meropenem for Injection*.

Assay—

Diluted phosphoric acid—Dilute 10 mL of phosphoric acid with water to make 100 mL of solution.

Solvent—Transfer 1.0 mL of triethylamine to a 1000-mL volumetric flask containing 900 mL of water. Adjust with *Diluted phosphoric acid* to a pH of 5.0 ± 0.1 , dilute with water to volume, and mix.

Mobile phase—Prepare a mixture of *Solvent* and methanol (5:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer about 25 mg of USP Meropenem RS, accurately weighed, to a 50-mL volumetric flask, add *Solvent*, swirl to dissolve, dilute with *Solvent* to volume, and mix. [NOTE—Immediately after preparation, store this solution in a refrigerator. It may be used for 24 hours.]

Assay preparation—Transfer about 25 mg of Meropenem, accurately weighed, to a 50-mL volumetric flask, add *Solvent*, swirl to dissolve, dilute with *Solvent* to volume, and mix. Use this solution immediately after preparation.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 300-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. Adjust the flow rate so that the retention time for meropenem is about 6 to 8 minutes. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2500 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 5 µL) of *Standard preparation* and *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of $C_{17}H_{25}N_3O_5S$ in the portion of Meropenem taken by the formula:

$$(W_S/W_U)(P)(r_U/r_S)$$

in which W_S is the weight, in mg, of USP Meropenem RS taken to prepare the *Standard preparation*, calculated on the anhydrous basis; W_U is the weight, in mg, of Meropenem taken to prepare the *Assay preparation*; P is the stated percentage, calculated on the anhydrous basis, of meropenem in USP Meropenem RS; and r_U and r_S are the meropenem peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Meropenem for Injection

DEFINITION

Meropenem for Injection is a sterile dry mixture of Meropenem and Sodium Carbonate. It contains NLT 90.0% and NMT 120.0% of the labeled amount of meropenem ($C_{17}H_{25}N_3O_5S$).

IDENTIFICATION

- A.** The retention time of the meropenem peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Solution A: 1:10 solution of phosphoric acid and water

Buffer: Dilute 15 mL of tetrabutylammonium hydroxide solution (25% in water) with water to 750 mL. Adjust with *Solution A* to a pH of 7.5 ± 0.1 .

Mobile phase: Acetonitrile, methanol, and *Buffer* (150:100:750)

Standard solution: 0.11 mg/mL of USP Meropenem RS in *Mobile phase*. Immediately after preparation, store this solution in a refrigerator, and use within 24 h.

Sample stock solution 1 (where it is represented as being a single-dose container): Nominally 1 mg/mL of meropenem, prepared as follows. Constitute a container of Meropenem for Injection with a volume of water, corresponding to the quantity of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and transfer to a suitable volumetric flask. Dilute with water to volume, and mix.

Sample solution 1: Nominally 0.1 mg/mL of meropenem in *Mobile phase* from *Sample stock solution 1*. Hold this *Sample solution 1* for 2 h at $25 \pm 1^\circ$ before testing.

Sample stock solution 2 (where the label states the quantity of meropenem in a given volume of constituted solution): Nominally 1 mg/mL of meropenem, prepared as follows. Constitute a container of Meropenem for Injection with a volume of water corresponding to the quantity of solvent specified in the labeling, and dilute with water.

Sample solution 2: Nominally 0.1 mg/mL of meropenem in *Mobile phase* from *Sample stock solution 2*. Hold this *Sample solution 2* for 2 h at $25 \pm 1^\circ$ before testing.

Chromatographic system

(See *Chromatography* (621), *System Suitability*)

Mode: LC

Detector: UV 300 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min. [NOTE—Adjust the flow rate to obtain a retention time for meropenem of about 6–8 min.]

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Tailing factor: NMT 1.5

Analysis

Samples: *Standard solution* and *Sample solution 1* or *Sample solution 2*

Calculate the percentage of the labeled amount of meropenem ($C_{17}H_{25}N_3O_5S$) in the portion of Meropenem for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times 100$$

r_U = peak response of meropenem from *Sample solution 1* or *Sample solution 2*

r_S = peak response of meropenem from the *Standard solution*

C_S = concentration of USP Meropenem RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of meropenem in *Sample solution 1* or *Sample solution 2* (mg/mL)

P = potency of meropenem in USP Meropenem RS (mg/mg)

Acceptance criteria: 90.0%–120.0%

OTHER COMPONENTS

CONTENT OF SODIUM

Solution A: 38.1 g/L of potassium chloride in water

Standard stock solution: 25.42 μ g/mL of sodium chloride (previously dried at 105° for 2 h) in water

Standard solution: 2.5 μ g/mL of sodium chloride from the *Standard stock solution* mixed first with *Solution A* to 10% of the final volume and diluted with water to volume

Sample stock solution 1 (where it is represented as being a single-dose container): Nominally 0.125 mg/mL of meropenem prepared as follows. Constitute a container of Meropenem for Injection with a volume of water corresponding to the quantity of solvent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and transfer to a suitable volumetric flask. Dilute with water to volume.

Sample stock solution 2 (where the label states the quantity of meropenem in a given volume of constituted solution): Nominally 0.125 mg/mL of meropenem prepared as follows. Constitute a container of Meropenem for Injection with a volume of water, corresponding to the quantity of solvent specified in the labeling. Transfer the constituted solution to a suitable volumetric flask, and dilute with water to volume.

Sample solution: Nominally 0.0125 mg/mL of meropenem from *Sample stock solution 1* or *Sample stock solution 2* mixed first with *Solution A* to 10% of the final volume, and dilute with water to volume

Blank: 1:10 mixture of *Solution A* and water

Instrumental conditions

(See *Atomic Absorption Spectroscopy* (852).)

Mode: Atomic absorption spectrophotometry

Analytical wavelength: 589.6 nm sodium emission line

Burner: Single-slot

Flame: Air–acetylene

Lamp: Sodium hollow-cathode

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of sodium (Na) in the portion of Meropenem for Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of sodium chloride in the *Standard solution* (μ g/mL)

C_U = nominal concentration of meropenem in the *Sample solution* (μ g/mL)

M_{r1} = atomic weight of sodium, 22.99

M_{r2} = molecular weight of sodium chloride, 58.44

Acceptance criteria: 80%–120% of the labeled amount of sodium

PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements

IMPURITIES**• ORGANIC IMPURITIES**

Solution A: 1:10 solution of phosphoric acid and water
Buffer: Mix 1 mL of triethylamine and 900 mL of water. Adjust with *Solution A* to a pH of 5.0 ± 0.1 , and dilute with water to 1000 mL.

Mobile phase: Acetonitrile and *Buffer* (70:1000)

Standard solution: 0.029 mg/mL of USP Meropenem RS in *Buffer*. Store this solution in a refrigerator immediately after preparation, and use within 24 h.

Sample solution: Nominally prepare 5 mg/mL of meropenem in *Buffer* from Meropenem for Injection. This solution has to be prepared fresh and used immediately.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Temperature: 40°

Flow rate: 1.6 mL/min. [NOTE—Adjust to obtain a retention time for meropenem of 5–7 min.]

Injection volume: 10 μ L

Run time: 3 times the retention time of meropenem

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Tailing factor: NMT 1.5

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Meropenem for Injection taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times 100$$

r_u = peak response of each individual impurity from the *Sample solution*

r_s = peak response of meropenem from the *Standard solution*

C_s = concentration of USP Meropenem RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of meropenem in the *Sample solution* (mg/mL)

P = potency of meropenem in USP Meropenem RS (mg/mg)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Meropenem impurity I ^a	0.45	0.8
Meropenem impurity II ^a	1.9	0.6

^a Specified, unidentified impurities.

SPECIFIC TESTS

• BACTERIAL ENDOTOXINS TEST (85): NMT 0.125 USP Endotoxin Unit/mg of meropenem

• CONSTITUTED SOLUTION: At the time of use, it meets the requirements for *Injections and Implanted Drug Products* (1), *Specific Tests, Completeness and clarity of solutions*.

• LOSS ON DRYING (731)

Analysis: Dry in a vacuum at 65° for 6 h.

Acceptance criteria: 9.0%–12.0%

• PARTICULATE MATTER IN INJECTIONS (788): Meets the requirements for small-volume injections

• pH (791)

Sample solution: 50 mg/mL

Acceptance criteria: 7.3–8.3

• STERILITY TESTS (71): Meets the requirements when tested as directed for *Test for Sterility of the Product to Be Examined, Membrane Filtration*

ADDITIONAL REQUIREMENTS**Change to read:**

• PACKAGING AND STORAGE: Preserve in tight containers as described in *Packaging and Storage Requirements* (659), *Injection Packaging, Packaging for constitution* (CN 1-May-2017). Store at controlled room temperature.

• LABELING: Meets the requirements for *Labeling* (7), *Labels and Labeling for Injectable Products*. Label it to state the quantity, in mg, of sodium (Na) in a given dosage of meropenem.

• USP REFERENCE STANDARDS (11)

USP Meropenem RS

Mesalamine

$C_7H_7NO_3$

Benzoic acid, 5-amino-2-hydroxy-;

5-Aminosalicylic acid [89-57-6].

153.14

DEFINITION

Mesalamine contains NLT 98.5% and NMT 101.5% of mesalamine ($C_7H_7NO_3$), calculated on the dried basis.

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B. The retention time of the mesalamine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer: Transfer 7.1 g of anhydrous dibasic sodium phosphate and 6.9 g of monobasic sodium phosphate to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 7.5 mL of a solution of tetrabutylammonium hydroxide 30-hydrate in methanol (1 in 4), dilute with water to volume, and mix.

Mobile phase: Methanol and *Buffer* (15:85)

System suitability solution: 0.25 mg/mL of 4-aminosalicylic acid and 0.4 mg/mL of USP Mesalamine RS in *Mobile phase*

Standard stock solution: 1 mg/mL of USP Mesalamine RS in *Mobile phase*

Standard solution: 0.4 mg/mL of USP Mesalamine RS in *Mobile phase* from the *Standard stock solution*

Sample stock solution: 1 mg/mL of Mesalamine in *Mobile phase*

Sample solution: 0.4 mg/mL of Mesalamine in *Mobile phase* from the *Sample stock solution*

Mesalamine Extended-Release Capsules**DEFINITION**Mesalamine Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of mesalamine ($C_7H_7NO_3$).**IDENTIFICATION****• A. INFRARED ABSORPTION (197K)**

Sample: Use the powdered, undried Capsule contents.

Analysis: Record the spectra in the range between 2000 cm^{-1} and 1240 cm^{-1} .

Acceptance criteria: Meet the requirements

ASSAY**• PROCEDURE****Buffer:** Dissolve 6.8 g of monobasic potassium phosphate and 1.65 g of sodium hydroxide in 800 mL of water. Adjust with 1 N sodium hydroxide to a pH of 7.5, dilute with water to 1000 mL, and mix.**Solution A:** Dissolve 3.4 g of tetrabutylammonium hydrogen sulfate and 1.4 g of sodium acetate trihydrate in 1000 mL of water. Adjust with 1 N sodium hydroxide to a pH of 6.6. Add 200 mL of acetonitrile, mix, and pass through a filter of 0.5- μ m or finer pore size. [NOTE—Increasing the proportion of acetonitrile decreases the retention times. Prepare fresh daily.]**Solution B:** Dissolve 4.6 g of tetrabutylammonium hydrogen sulfate and 1.9 g of sodium acetate trihydrate in 1000 mL of water, and adjust with 1 N sodium hydroxide to a pH of 6.6. Add 650 mL of acetonitrile, mix, and pass through a filter of 0.5- μ m or finer pore size. [NOTE—Prepare fresh daily.]Mobile phase: See *Table 1*.**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
5	100	0
7	0	100
15	0	100
17	100	0
20	100	0

Internal standard solution: 35 mg/mL of sodium benzoate in *Buffer***Standard solution:** Transfer about 50 mg of USP Mesalamine RS to a 100-mL volumetric flask. Add 4.0 mL of the *Internal standard solution*, dilute with *Buffer* to volume, and mix. Dilute 5.0 mL of this solution with *Buffer* to 25 mL.

Sample solution: Transfer, as completely as possible, the contents of NLT 20 Capsules to a suitable tared container, and determine the average weight of the contents of a Capsule. Finely powder the Capsule contents so that the powder thus obtained passes through a No. 40 sieve (see *Powder Fineness* (811)). Transfer a portion of the powder, nominally equivalent to about 250 mg of mesalamine, to a 500-mL volumetric flask. Add 20.0 mL of the *Internal standard solution* and about 300 mL of *Buffer*, and shake by mechanical means for 1 h. Dilute with *Buffer* to volume, and mix. Transfer 5.0 mL of this solution to a 25-mL volumetric flask. Dilute with *Buffer* to volume, mix, and pass about 10 mL of this solution through a filter of 0.5- μ m or finer pore size. Use the filtrate as the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4.6-mm \times 25-cm; 5- μ m packing L1

Flow rate: 1.5 mL/min

Injection volume: 10 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for mesalamine and sodium benzoate are about 0.6 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.5 between mesalamine and sodium benzoate

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) in the portion of Capsule contents taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of mesalamine to sodium benzoate from the *Sample solution*

R_S = peak response ratio of mesalamine to sodium benzoate from the *Standard solution*

C_S = concentration of USP Mesalamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mesalamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Buffer: 0.05 M pH 7.5 phosphate buffer prepared as follows. Dissolve 6.8 g of monobasic potassium phosphate and 1 g of sodium hydroxide in water to make 1000 mL of solution, and adjust with 10 N sodium hydroxide to a pH of 7.50 ± 0.05 .

Medium: *Buffer*, 900 mL

Apparatus 2: 100 rpm

Times: 1, 2, 4, and 8 h

Standard solution: A known concentration of USP Mesalamine RS in *Medium*

Sample solution: Filter portions of the solution under test suitably diluted with *Medium*, if necessary.

Analysis: Calculate the percentages of the labeled amount of mesalamine ($C_7H_7NO_3$) dissolved at the wavelength of maximum absorbance at about 330 nm by comparing the UV absorbances of the *Sample solution* with that of the *Standard solution*.

Tolerances: See *Table 2*.

Table 2

Time (h)	Amount Dissolved
1	5%–25%
2	30%–50%

Table 2 (Continued)

Time (h)	Amount Dissolved
4	60%–90%
8	NLT 85%

The percentages of the labeled amount of mesalamine ($C_7H_7NO_3$) dissolved at the times specified conform to *Acceptance Table 2* in (711).

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Mesalamine RS

Mesalamine Rectal Suspension

DEFINITION

Mesalamine Rectal Suspension is a suspension of Mesalamine in a suitable aqueous vehicle. It contains NLT 90.0% and NMT 110.0% of the labeled amount of mesalamine ($C_7H_7NO_3$). It contains one or more suitable preservatives.

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: Transfer 7.1 g of anhydrous dibasic sodium phosphate and 6.9 g of monobasic sodium phosphate to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 7.5 mL of a solution of tetrabutylammonium hydroxide in methanol (1 in 4), dilute with water to volume, and mix.

Mobile phase: Methanol and *Buffer* (15:85)

System suitability solution: 0.25 mg/mL of 4-aminosalicylic acid and 0.4 mg/mL of USP Mesalamine RS in *Mobile phase*

Standard stock solution: 1 mg/mL of USP Mesalamine RS in *Mobile phase*

Standard solution: 0.4 mg/mL of USP Mesalamine RS in *Mobile phase* from the *Standard stock solution*

Sample solution: Transfer an accurately measured, well-shaken quantity of Rectal Suspension, nominally equivalent to about 100 mg of mesalamine, to a 100-mL volumetric flask. Add 55 mL of *Mobile phase*, and dissolve by shaking for about 10 min. Dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Pass this solution through a suitable filter of 0.5- μ m or finer pore size, and use the filtrate as the *Sample solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 15 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between 4-aminosalicylic acid and mesalamine, *System suitability solution*

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) in the portion of Rectal Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of mesalamine from the *Sample solution*

r_S = peak response of mesalamine from the *Standard solution*

C_S = concentration of USP Mesalamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mesalamine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• CONTENT OF SODIUM BENZOATE (if present)

Mobile phase: Transfer 390 mg of ammonium acetate to a 1000-mL volumetric flask, add 100 mL of water, and dissolve by swirling. Add 6 mL of glacial acetic acid and 300 mL of methanol, dilute with water to volume, and mix. Pass this solution through a filter of 0.5- μ m or finer pore size.

Standard solution: 1 mg/mL of sodium benzoate in water. To 5.0 mL of this solution add 40 mL of methanol, and dilute with water to 100 mL. Pass this solution through a filter of 0.5- μ m or finer pore size.

Sample solution: Transfer about 5 g of well-shaken Rectal Suspension to a 100-mL volumetric flask. Add 40 mL of methanol, dilute with water to volume, and mix. Pass the solution through a filter of 0.5- μ m or finer pore size.

Chromatographic system

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25.0-cm; packing L7

Flow rate: 1.5 mL/min

Injection volume: 15 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage (w/w) of sodium benzoate in the Rectal Suspension taken:

$$\text{Result} = (r_U/r_S) \times C_S \times (10/W)$$

r_U = peak response of sodium benzoate from the *Sample solution*

r_S = peak response of sodium benzoate from the *Standard solution*

C_S = concentration of sodium benzoate in the *Standard solution* (mg/mL)

W = weight of Rectal Suspension taken (g)

Acceptance criteria: 0.05%–0.125%

PERFORMANCE TESTS

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Buffer: Transfer 7.1 g of anhydrous dibasic sodium phosphate and 6.9 g of monobasic sodium phosphate to a 1000-mL volumetric flask, add 500 mL of water, and swirl to dissolve. Add 7.5 mL of a solution of tetrabutylammonium hydroxide in methanol (1 in 4), dilute with water to volume, and mix.

Mobile phase: Methanol and Buffer (15:85)

System suitability solution: 0.25 mg/mL of 4-aminosalicylic acid and 0.4 mg/mL of USP Mesalamine RS in *Mobile phase*

Standard stock solution: Transfer about 100 mg of USP Mesalamine RS to a 50-mL volumetric flask, add 15 mL of 2 N hydrochloric acid, and dissolve by swirling. Dilute with 2 N hydrochloric acid to volume, and mix.

Standard solution: Add 5 mL of 2 N sodium hydroxide to 5.0 mL of the *Standard stock solution*, and dilute with *Mobile phase* to 25 mL. Pass this solution through a filter of 0.5- μ m or finer pore size.

Sample stock solution: Transfer, with the aid of 2 N hydrochloric acid, the contents of a container of Rectal Suspension to a 200-mL volumetric flask. Add 2 N hydrochloric acid to obtain about 160 mL of solution, and shake for 10 min. Dilute with 2 N hydrochloric acid to volume, and mix.

Sample solution: Transfer a suitable volume of the *Sample stock solution*, nominally equivalent to 40 mg of mesalamine, to a 100-mL volumetric flask. Add a volume of 2 N hydrochloric acid, equal to the added volume of the *Sample stock solution*, dilute with *Mobile phase* to volume, and mix. Pass this solution through a suitable filter of 0.5- μ m or finer pore size.

Chromatographic system

(See Chromatography (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm \times 30-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 15 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 2.0 between 4-aminosalicylic acid and mesalamine, *System suitability solution*

Tailing factor: NMT 2.5, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) in the container of Rectal Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of mesalamine from the *Sample solution*

r_S = peak response of mesalamine from the *Standard solution*

C_S = concentration of USP Mesalamine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mesalamine in the *Sample solution* (mg/mL)

Acceptance criteria: Meets the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase: Dissolve 1.36 g of monobasic potassium phosphate and 2.2 g of sodium 1-octanesulfonate in 890 mL of water, and adjust with phosphoric acid to a pH of 2.2. Pass through a filter of 0.5- μ m or finer pore size. To the filtrate add 80 mL of methanol and 30 mL of acetonitrile.

Standard solution: 1 μ g/mL each of USP Mesalamine RS and 3-aminosalicylic acid in *Mobile phase*

Sample solution: Transfer a volume of Rectal Suspension, previously well shaken, nominally equivalent to 100 mg of mesalamine, to a beaker. Add water to give a volume of about 80 mL, and adjust with phosphoric acid to a pH of 2.0. Sonicate briefly to dissolve, transfer

to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 220 nm

Column: 4.6-mm × 15-cm; 5-μm packing L7

Flow rate: 1.2 mL/min

Injection volume: 20 μL

Run time: 3 times the retention time of mesalamine

System suitability

Sample: Standard solution

[NOTE—The relative retention times for mesalamine and 3-aminosalicylic acid are about 1.0 and 1.3, respectively.]

Suitability requirements

Resolution: NLT 2 between mesalamine and 3-aminosalicylic acid

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of each impurity in the portion of Rectal Suspension taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of any individual impurity from the Sample solution

r_s = peak response of mesalamine from the Standard solution

C_s = concentration of USP Mesalamine RS in the Standard solution (μg/mL)

C_u = nominal concentration of mesalamine in the Sample solution (μg/mL)

Acceptance criteria

Individual impurities: NMT 0.2%

Total impurities: NMT 1.0%

SPECIFIC TESTS

• PH (791)

Sample solution: Dilute the Rectal Suspension 1 to 10 with water.

Acceptance criteria: 3.5–5.5

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Mesalamine RS

Mesalamine Delayed-Release Tablets

DEFINITION

Mesalamine Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of mesalamine ($C_7H_7NO_3$).

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

Sample solution: To about 50 mL of water add a quantity of finely powdered Tablets, nominally equivalent to about 800 mg of mesalamine. Boil the mixture for about 5 min, with constant stirring. Filter the hot solution, and allow the filtrate to cool. Collect the precipitated crystals, and dry at about 110°.

Acceptance criteria: Meet the requirements

ASSAY

• **PROCEDURE**

Mobile phase: Dissolve 4.3 g of sodium 1-octanesulfonate in 1 L of water. Adjust with phosphoric acid to a pH

of 2.15, pass through a filter of 0.45-μm or finer pore size, and degas.

System suitability stock solution:

Transfer about 20 mg each of 3-aminosalicylic acid and USP Salicylic Acid RS to a 200-mL volumetric flask. Dissolve in 50 mL of 1 N hydrochloric acid, sonicate to dissolve, dilute with water to volume, and mix.

System suitability solution:

0.01 mg/mL each of 3-aminosalicylic acid and salicylic acid in water from the System suitability stock solution

Standard stock solution:

Transfer about 25 mg of USP Mesalamine RS to a 25-mL volumetric flask. Dissolve in 5 mL of 0.25 N hydrochloric acid, sonicate to dissolve, dilute with water to volume, and mix.

Standard solution: Transfer 10.0 mL of the Standard stock solution and 5.0 mL of the System suitability solution to a 50-mL volumetric flask. Dilute with water to volume, mix, and pass through a filter of 0.5-μm or finer pore size.

Sample solution: Pipet a 25.0-mL aliquot of the Sample solution, obtained as directed in Organic Impurities, into a 100-mL volumetric flask. Dilute with water to volume, and pass through a filter of 0.5-μm or finer pore size.

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: LC

Detector: UV 230 nm

Columns

Precolumns: Two 4.6-mm × 3.0-cm; each containing 10-μm packing L1 and located between the pump and the injector

Analytical: 4.6-mm × 3.3-cm; 3-μm base-deactivated packing L1

Flow rate: 2 mL/min

Injection volume: 20 μL

System suitability

Sample: Standard solution

Suitability requirements

Resolution: NLT 2 between mesalamine and salicylic acid or 3-aminosalicylic acid

Tailing factor: NMT 2

Relative standard deviation: NMT 2.0%

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of mesalamine from the Sample solution

r_s = peak response of mesalamine from the Standard solution

C_s = concentration of USP Mesalamine RS in the Standard solution (mg/mL)

C_u = nominal concentration of mesalamine in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION (711)**

Solution A: Transfer about 43.35 g of monobasic potassium phosphate and 1.65 g of sodium hydroxide to a 2-L volumetric flask. Dissolve in and dilute with water to volume, and mix. Adjust with 1 N sodium hydroxide or phosphoric acid to a pH of 6.0, and mix.

Solution B: Transfer 133.6 g of sodium hydroxide to a 2-L volumetric flask, dissolve in and dilute with water to volume, and mix.

Medium

Acid stage: 500 mL of 0.1 N hydrochloric acid

Buffer stages: 900 mL of *Solution A*

Apparatus 2

Acid stage: 100 rpm

Buffer stage 1: 100 rpm

Buffer stage 2: 50 rpm

Times

Acid stage: 2 h

Buffer stage 1: 1 h

Buffer stage 2: 90 min

Acid stage

After 2 h of operation, withdraw an aliquot of the fluid, discard the remaining solution, and retain the Tablets in proper order so that each will be returned later to its respective vessel. Blot the Tablets with a paper towel to dry, and proceed immediately as directed in *Buffer stage 1*.

Standard solution: A known concentration of USP Mesalamine RS in *Medium*, equivalent to about 1% of the labeled amount of mesalamine ($C_7H_7NO_3$)

Sample solution: Filter portions of the solution under test, and suitably dilute with *Medium*, if necessary.

Analysis: Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) dissolved by comparing the UV maximum absorbance at about 302 nm of the *Sample solution* with that of the *Standard solution*.

Tolerances: See *Table 1*. Continue testing through all levels unless the results conform at an earlier level.

Buffer stage 1

[NOTE—Use *Solution A* that has been equilibrated to a temperature of $37 \pm 0.5^\circ$.]

Transfer *Solution A* to each of the dissolution vessels, and place each Tablet from the *Acid stage* into its respective vessel. After 1 h, remove a 50-mL aliquot, and proceed immediately as directed in *Buffer stage 2*.

Standard solution: A known concentration of USP Mesalamine RS in *Medium*, equivalent to about 1% of the labeled amount of mesalamine ($C_7H_7NO_3$)

Sample solution: Filter portions of the solution under test, and suitably dilute with *Medium*, if necessary.

Analysis: Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) dissolved by comparing the UV maximum absorbance at about 330 nm of the *Sample solution* with that of the *Standard solution*.

Tolerances: See *Table 1*. Continue testing through all levels unless the results conform at an earlier level.

Table 1

Level	Number Tested	Acceptance Criteria
L1	6	No individual value exceeds 1% dissolved.
L2	6	Average of the 12 units ($L_1 + L_2$) is NMT 1% dissolved, and no individual unit is greater than 10% dissolved.
L3	12	Average of the 24 units ($L_1 + L_2 + L_3$) is NMT 1% dissolved, and NMT one individual unit is greater than 10% dissolved.

Buffer stage 2

Add 50 mL of *Solution B* to each dissolution vessel to adjust to a pH of 7.2, and continue the run.

Standard solution: A known concentration of USP Mesalamine RS in *Medium*

Sample solution: Filter portions of the solution under test, and suitably dilute with *Medium*, if necessary.

Analysis: Calculate the percentage of the labeled amount of mesalamine ($C_7H_7NO_3$) dissolved by comparing the UV maximum absorbance at about 332 nm of the *Sample solution* with that of the *Standard solution*.

Tolerances: NLT 80% (Q) of the labeled amount of mesalamine ($C_7H_7NO_3$) is dissolved. The requirements are met if the quantities dissolved from the product conform to *Acceptance Table 4* in (711). Continue testing through all levels unless the results conform at an earlier level.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Weight Variation*

IMPURITIES• **ORGANIC IMPURITIES**

Mobile phase, System suitability stock solution, System suitability solution, Standard stock solution, Standard solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Sample solution: Transfer a portion nominally equivalent to about 400 mg of mesalamine, from NLT 20 finely powdered Tablets, to a 500-mL volumetric flask. Add 50 mL of 1 N hydrochloric acid, and sonicate to dissolve. Shake by mechanical means for 10 min, dilute with water to volume, mix, and pass through a filter of 0.5- μ m or finer pore size.

[NOTE—Use an aliquot of this solution for the preparation of the *Sample solution* in the *Assay*.]

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_i/r_T) \times 100$$

r_i = peak response for each impurity

r_T = sum of all the peak responses

Acceptance criteria

Individual impurity: The largest secondary peak is NMT 1.0% of the total area.

Any other individual impurity: NMT 0.5%

Total impurities: NMT 2.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Mesalamine RS
USP Salicylic Acid RS

Mesna

$C_2H_5NaO_3S_2$ 164.18
Ethanesulfonic acid, 2-mercapto-, monosodium salt;
Sodium 2-mercaptoethanesulfonate [19767-45-4].

DEFINITION

Mesna contains NLT 96.0% and NMT 102.0% of mesna ($C_2H_5NaO_3S_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. IDENTIFICATION TESTS—GENERAL (191), Sodium**
Acceptance criteria: Meet the requirements

ASSAY• **PROCEDURE**

Sample solution: 120 mg of Mesna in 10 mL of water

Analysis: To the *Sample solution* add 10 mL of 1 M sulfuric acid and 10 mL of 0.1 N iodine VS. Titrate with 0.1 N sodium thiosulfate VS, adding 1 mL of starch TS near the endpoint. Perform a blank determination, and make any necessary corrections (see *Titrimetry* (541)).

Each mL of sodium thiosulfate is equivalent to 16.42 mg of mesna ($C_2H_5NaO_3S_2$).

Acceptance criteria: 96.0%–102.0% on the dried basis

IMPURITIES

• LIMIT OF CHLORIDE

Chloride standard solution: 8.24 µg/mL of sodium chloride in water

Sample solution: 200 mg/mL of Mesna in carbon dioxide-free water

Analysis: To 1 mL of the *Sample solution* and 15 mL of water add 1 mL of 2 M nitric acid. Add the resulting solution to 1 mL of silver nitrate solution (17 g in 1000 mL), and allow to stand for 5 min, protected from light. To 10 mL of the *Chloride standard solution* add 5 mL of water and 1 mL of 2 M nitric acid. To this solution add 1 mL of silver nitrate solution (17 g in 1000 mL) and allow to stand for 5 min, protected from light. When viewed against a dark background, the *Sample solution* is not more turbid than the *Chloride standard solution*.

Acceptance criteria: NMT 250 ppm

• LIMIT OF SULFATE

Diluent: 30% (v/v) ethanol in water

Sulfate standard stock solution: 1.81 mg/mL of potassium sulfate in *Diluent*

Sulfate standard solution: 0.0181 mg/mL of potassium sulfate in *Diluent*, prepared immediately before use from *Sulfate standard stock solution*

Sample solution: Add 5.0 mL of the *Sample solution* prepared as directed in the test for *Limit of Chloride* to a 30-mL volumetric flask, and dilute with water to volume.

Analysis: Add 3 mL of a 250-g/L solution of barium chloride to 4.5 mL of *Sulfate standard solution*. Shake and allow to stand for 1 min. To 2.5 mL of this solution add 15 mL of the *Sample solution* and 0.5 mL of acetic acid. Use 15 mL of this mixture for comparison with 15 mL of the *Sulfate standard solution*, prepared in the same manner, but using the *Sulfate standard solution* instead of the *Sample solution*. After 5 min, any opalescence in the *Sample solution* is not more intense than that in the *Sulfate standard solution*.

Acceptance criteria: NMT 300 ppm

Delete the following:

• **HEAVY METALS**, *Method I* (231): 10 ppm • (Official 1-Jan-2018)

• ORGANIC IMPURITIES

Mobile phase: In a 1000-mL volumetric flask dissolve 2.94 g of potassium dihydrogen phosphate, 2.94 g of dipotassium hydrogen phosphate, and 2.6 g of tetrabutylammonium hydrogen sulfate in about 600 mL of water. Adjust with phosphoric acid to a pH of 2.3, add 335 mL of methanol, and dilute with water to volume.

System suitability solution: 0.18 mg/mL and 0.004 mg/mL of USP Mesna RS and USP Mesna Related Compound A RS, respectively, in *Mobile phase*

Standard solution 1: 8 µg/mL and 120 µg/mL of USP Mesna Related Compound A RS and USP Mesna Related Compound B RS, respectively, in *Mobile phase*

Standard solution 2: 12 µg/mL of USP Mesna RS in *Mobile phase*

Sample solution: 4 mg/mL of Mesna in *Mobile phase*

Chromatographic system

Mode: LC

Detector: UV 235 nm

Column: 4.6-mm × 25-cm; 10-µm packing L1

Flow rate: 1 mL/min

Run time: Four times the elution time for mesna

Injection volume: 20 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for mesna and mesna related compound A are about 1.0 and 1.4, respectively.]

Suitability requirements

Resolution: NLT 3.0 between mesna and mesna related compound A

Analysis

Samples: *Standard solution 1*, *Standard solution 2*, and *Sample solution*

[NOTE—Identify the peaks using the relative retention times provided in *Table 1*.]

Calculate the percentage of mesna related compound A in the portion of Mesna taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of mesna related compound A from the *Sample solution*

r_s = peak response of mesna related compound A from *Standard solution 1*

C_s = concentration of USP Mesna Related Compound A RS in *Standard solution 1* (mg/mL)

C_u = concentration of Mesna in the *Sample solution* (mg/mL)

Calculate the percentage of mesna related compound B in the portion of Mesna taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response of mesna related compound B from the *Sample solution*

r_s = peak response of mesna related compound B from *Standard solution 1*

C_s = concentration of USP Mesna Related Compound B RS in *Standard solution 1* (mg/mL)

C_u = concentration of Mesna in the *Sample solution* (mg/mL)

Calculate the percentage of any specified impurities (thiuronium ethanesulfonic acid, guanidinothiuronium ethanesulfonic acid, and mesna triazine analog) and any unspecified impurities in the portion of Mesna taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times (1/F) \times 100$$

r_u = peak response of any specified or unspecified individual impurity from the *Sample solution*

r_s = peak response of mesna from *Standard solution 2*

C_s = concentration of USP Mesna RS in *Standard solution 2* (mg/mL)

C_u = concentration of Mesna in the *Sample solution* (mg/mL)

F = relative response factors (see *Table 1*)

Acceptance criteria: See *Table 1*.

Table 1

Solution: 10 µg per mL.

Medium: methanol.

Absorptivities at 263 nm, calculated on the dried basis, do not differ by more than 3.0%.

pH (791): between 4.2 and 5.7, in a freshly prepared solution (1 in 100).

Loss on drying (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.2%.

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. (Official 1-Jan-2018)

Selenium (291)—The absorbance of the solution from the Test Solution, prepared with 100 mg of Mesoridazine Besylate and 100 mg of magnesium oxide, is not greater than one-half that from the Standard Solution (0.003%).

Ordinary impurities (466)—

Test solution: a solution in methanol having a known concentration of 14.1 mg per mL equivalent to 10 mg of mesoridazine per mL.

Standard solution: methanol.

Eluant: a mixture of chloroform, isopropyl alcohol, and ammonium hydroxide (87:12:1).

Visualization: 3, followed by spraying with 3% (v/v) aqueous hydrogen peroxide.

Application volume: 10 µL.

Limit: 3.0%.

Assay—Dissolve about 150 mg of Mesoridazine Besylate, accurately weighed, in 70 mL of acetic anhydride, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.24 mg of C₂₁H₂₆N₂O₅S₂ · C₆H₅O₃S.

Mesoridazine Besylate Injection**DEFINITION**

Mesoridazine Besylate Injection is a sterile solution of Mesoridazine Besylate in Water for Injection. It contains mesoridazine besylate (C₂₁H₂₆N₂O₅S₂ · C₆H₅O₃S) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of mesoridazine (C₂₁H₂₆N₂O₅S₂).

Throughout the following procedures, protect samples, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

IDENTIFICATION**• A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)**

Sample solution: Dilute a volume of Injection, equivalent to 50 mg of mesoridazine besylate, with 0.01 N hydrochloric acid to 25 mL.

Analysis: Proceed as directed in the chapter, beginning with "Transfer the liquid to a separator".

Acceptance criteria: Meets the requirements

ASSAY

PROCEDURE

Conduct this procedure with minimum exposure to light.

Standard solution and Sample solution: Proceed with Injection as directed in *Salts of Organic Nitrogenous Bases* (501), except use 1.0 mL each of the *Standard Preparation* and the *Assay Preparation* in the *Procedure*.

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: Maximum at about 262 nm

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$) in the portion of Injection taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Mesoridazine Besylate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of mesoridazine besylate in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of mesoridazine, 386.59

M_{r2} = molecular weight of mesoridazine besylate, 544.75

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 7.0 USP Endotoxin Units/mg of mesoridazine besylate.

• **pH** (791): 4.0–5.0

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass, protected from light.

• **USP REFERENCE STANDARDS** (11)

USP Endotoxin RS

USP Mesoridazine Besylate RS

Mesoridazine Besylate Oral Solution

DEFINITION

Mesoridazine Besylate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$).

Throughout the following procedures, protect samples, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

IDENTIFICATION

A.

Conduct this test without exposure to daylight and with the minimum necessary exposure to artificial light.

Standard solution: 14 mg/mL of USP Mesoridazine Besylate RS in methanol

Sample solution: Transfer 4.0 mL of Oral Solution into a separator, add 6 mL of 1 N sodium hydroxide and 10 mL of chloroform, shake for 2 min, and filter the chloroform layer through anhydrous sodium sulfate into a small, glass-stoppered conical flask.

Chromatographic system

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 10 μL

Developing solvent system: To a separator add benzene, alcohol, and ammonium hydroxide (10:2:1). Shake, and allow the layers to separate. Use the upper layer.

Spray reagent: Perchloric acid and water (15:85)

Analysis

Samples: *Standard solution* and *Sample solution*

Allow the spots to dry and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in a fume hood. Spray the plate with *Spray reagent*, and heat at 80° for 2 min.

Acceptance criteria: The principal spot of the *Sample solution* corresponds in R_f value and color to that of the *Standard solution*.

ASSAY

PROCEDURE

Conduct this procedure with the minimum necessary exposure to light.

Standard stock solution: 0.14 mg/mL of USP Mesoridazine Besylate RS in chloroform prepared as follows. Transfer 14 mg of USP Mesoridazine Besylate RS to a 125-mL separator containing 30 mL of water. Render the solution alkaline with 10 mL of 1 N sodium hydroxide, and extract with three 30-mL portions of chloroform. Filter the extracts through anhydrous sodium sulfate into a 100-mL volumetric flask. Rinse the filter with small portions of chloroform, collecting the rinsings in the volumetric flask, and dilute with chloroform to volume.

Standard solution: 0.014 mg/mL of USP Mesoridazine Besylate RS from a suitable volume of *Standard stock solution* and chloroform

Sample stock solution: Nominally 1 mg/mL of mesoridazine in chloroform prepared as follows. Pipet a volume of Oral Solution, equivalent to 100 mg of mesoridazine, into a separator containing 30 mL of water. Render the solution alkaline with 10 mL of 1 N sodium hydroxide, and extract with three 30-mL portions of chloroform. Filter the extracts through anhydrous sodium sulfate into a 100-mL volumetric flask. Rinse the filter with small portions of chloroform, collecting the rinsings in the volumetric flask, and dilute with chloroform to volume.

Sample solution: Nominally 0.1 mg/mL of mesoridazine from a suitable volume of *Sample stock solution* and chloroform

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: About 267 nm

Cell: 1 cm

Blank: Chloroform

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$) in the portion of Oral Solution taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Mesoridazine Besylate RS in the *Standard solution* ($\mu\text{g/mL}$)

C_U = nominal concentration of mesoridazine in the *Sample solution* ($\mu\text{g/mL}$)

M_{r1} = molecular weight of mesoridazine, 386.59

M_{r2} = molecular weight of mesoridazine besylate, 544.75

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **DELIVERABLE VOLUME** (698)
For multiple-unit containers
Acceptance criteria: Meets the requirements
- **UNIFORMITY OF DOSAGE UNITS** (905)
For single-unit containers
Acceptance criteria: Meets the requirements

SPECIFIC TESTS

- **ALCOHOL DETERMINATION**, Method I (611): 0.25%–1.0% of the labeled amount of alcohol (C_2H_5OH) is found.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at a temperature not exceeding 25°.
- **LABELING:** Label it to indicate that it is to be diluted to the appropriate strength with water or other suitable fluid before administration.
- **USP REFERENCE STANDARDS** (11)
USP Mesoridazine Besylate RS

Mesoridazine Besylate Tablets

DEFINITION

Mesoridazine Besylate Tablets contain mesoridazine besylate ($C_{21}H_{26}N_2O_5 \cdot C_6H_5O_3S$) equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$).

Throughout the following procedures, protect samples, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES** (181):
Meet the requirements

ASSAY

PROCEDURE

Mobile phase: Acetonitrile, triethylamine, and water (850:1:150)

Standard solution: 0.35 mg/mL of USP Mesoridazine Besylate RS in methanol

System suitability solution: 0.025 mg/mL of thioridazine hydrochloride in *Standard solution*

Sample solution: Nominally 0.25 mg/mL of mesoridazine prepared as follows. Transfer an amount of powder equivalent to NLT 50 mg of mesoridazine, from NLT 20 powdered Tablets, to a suitable volumetric flask. Add 75% of the flask volume of methanol, shake by mechanical means for 15 min, and dilute with methanol to volume. Sonicate for 30 min, and allow dispersed material to settle. Filter through a 0.25- μ m disk, discarding the first 20 mL of the filtrate.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 265 nm

Column: 4.6-mm \times 25-cm; packing L1

Flow rate: 2.5 mL/min

Injection volume: 10 μ L

System suitability

Samples: *Standard solution* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.0 between mesoridazine besylate and thioridazine hydrochloride, *System suitability solution*

Column efficiency: NLT 750 theoretical plates for the mesoridazine peak, *System suitability solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Mesoridazine Besylate RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of mesoridazine in the *Sample solution* (mg/mL)

M_{r1} = molecular weight of mesoridazine, 386.59

M_{r2} = molecular weight of mesoridazine besylate, 544.75

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.01 N hydrochloric acid; 1000 mL

Apparatus 2: 100 rpm

Time: 60 min

Standard solution: USP Mesoridazine Besylate RS in *Medium*. [NOTE—A volume of methanol not exceeding 1% of the final total volume may be used to prepare the *Standard solution*.]

Sample solution: Filter the solution under test, suitably diluted with *Medium*, if necessary, to a concentration that is similar to the *Standard solution*.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 261 nm

Tolerances: NLT 80% (Q) of the labeled amount of mesoridazine ($C_{21}H_{26}N_2O_5$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Preserve Tablets with an opaque coating in well-closed containers.
- **USP REFERENCE STANDARDS** (11)
USP Mesoridazine Besylate RS

Mestranol

$C_{21}H_{26}O_2$ 310.43
19-Norpregna-1,3,5(10)-trien-20-yn-17-ol, 3-methoxy-, (17 α)-;
3-Methoxy-19-nor-17 α -pregna-1,3,5(10)-trien-20-yn-17-ol
[72-33-3].

DEFINITION

Mestranol contains NLT 97.0% and NMT 102.0% of mestranol ($C_{21}H_{26}O_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
- **B. ULTRAVIOLET ABSORPTION (197U)**
Sample solution: 100 µg/mL of Mestranol in methanol
Acceptance criteria: Meets the requirements
- **C.**
Standard solution: 1 mg/mL of USP Mestranol RS in chloroform
Sample solution: 1 mg/mL of Mestranol in chloroform
Chromatographic system
(See *Chromatography* (621), *Thin-Layer Chromatography*.)
Mode: TLC
Adsorbent: 0.25-mm layer of chromatographic silica gel mixture
Application volume: 10 µL
Developing solvent system: Chloroform and dehydrated alcohol (29:1)
Spray reagent: Prepare as directed in *Solution A* in the Assay.

Analysis

Samples: *Standard solution* and *Sample solution*
Apply both solutions to a line parallel to and 2.5 cm from the bottom edge of a thin-layer chromatographic plate. Place the plate in the *Developing solvent system*. Develop the chromatogram until the solvent front has moved about 15 cm from the origin. Remove the plate from the chamber, allow the solvent to evaporate, and spray with *Spray reagent*. Heat the plate in an oven at 105° for 5 min, and observe under long-wavelength UV light.

Acceptance criteria: The R_f value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

ASSAY• **PROCEDURE**

Solution A: Pipet 30 mL of methanol into a 100-mL volumetric flask contained in an ice bath. Add slowly and cautiously and with continuous stirring about 65 mL of sulfuric acid, taking care that the temperature remains below 15°. Allow the solution to warm to room temperature, and dilute with sulfuric acid to volume.

Standard solution: 5 µg/mL of USP Mestranol RS in chloroform

Sample solution: 5 µg/mL of Mestranol in chloroform

Analysis: Pipet 4 mL each of the *Standard solution* and the *Sample solution* into separate glass-stoppered, 25-mL conical flasks. Evaporate the solutions under a slow current of air, without the aid of heat, to dryness. Dissolve the residue in 0.3 mL of methanol. Place the flasks in a water bath maintained at a temperature of 25°, and pipet into each, with constant swirling, 10 mL of *Solution A*. Insert the stoppers in the flasks. At 6 min, accurately timed after the addition of *Solution A*, concomitantly determine the absorbances of the solutions.

Instrumental conditions

Mode: Vis

Analytical wavelength: Maximum at about 545 nm

Cell: 1 cm

Blank: *Solution A*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Calculate the percentage of mestranol ($C_{21}H_{26}O_2$) in the portion of Mestranol taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

- A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of USP Mestranol RS in the *Standard solution* (µg/mL)
 C_U = concentration of Mestranol in the *Sample solution* (µg/mL)

Acceptance criteria: 97.0%–102.0% on the dried basis

SPECIFIC TESTS

- **LOSS ON DRYING (731)**
Analysis: Dry at 105° for 3 h.
Acceptance criteria: NMT 1.0%
- **MELTING RANGE OR TEMPERATURE (741):** 146°–154°, but the range between beginning and end of melting does not exceed 4°.
- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 20 mg, previously dried, per mL, in dioxane
Acceptance criteria: +2° to +8°

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS (11)**
USP Mestranol RS

Metacresol

C_7H_8O

3-Methylphenol;

3-Hydroxytoluene [108-39-4].

108.14

DEFINITION

Metacresol contains NLT 98.0% and NMT 102.0% of metacresol (C_7H_8O).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197F)**
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

ASSAY• **PROCEDURE**

Internal standard solution: 1 mg/mL of USP Phenol RS in methanol

System suitability solution: 5 mg/mL each of metacresol, orthocresol, and paracresol in methanol

Standard solution: 1 mg/mL of USP Metacresol RS in the *Internal standard solution*

Sample solution: 1 mg/mL of Metacresol in the *Internal standard solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame-ionization

Column: 0.25-mm × 30-m; 0.25-µm coating of G7

Temperatures

Injection port: 200°

Detector: 200°

Column: See Table 1.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
90	0	90	10
90	2	120	0
120	10	150	3

Carrier gas: Helium

Flow rate: 1.8 mL/min

Injection type: Split ratio of 1:40

Injection volume: 1 μ L

System suitability

Samples: System suitability solution and Standard solution

[NOTE—The relative retention times for phenol, orthocresol, paracresol, and metacresol are about 0.77, 0.85, 0.99, and 1.00, respectively.]

Suitability requirements

Resolution: NLT 1.4 between the paracresol and metacresol peaks, System suitability solution

Relative standard deviation: NMT 1.0% for the peak ratio of metacresol to phenol, Standard solution

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of metacresol (C_7H_8O) in the portion of Metacresol taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = ratio of the metacresol peak response to the phenol peak response from the Sample solution

R_S = ratio of the metacresol peak response to the phenol peak response from the Standard solution

C_S = concentration of USP Metacresol RS in the Standard solution (mg/mL)

C_U = concentration of Metacresol in the Sample solution (mg/mL)

Acceptance criteria: 98.0%–102.0%

IMPURITIES

• ORGANIC IMPURITIES

System suitability solution: 5 mg/mL each of metacresol, orthocresol, and paracresol in methanol

Sensitivity solution: 5 μ g/mL of USP Metacresol RS in methanol

Sample solution: 10 mg/mL of Metacresol in methanol

Chromatographic system

(See Chromatography <621>, System Suitability.)

Mode: GC

Samples: System suitability solution and Sensitivity solution

Suitability requirements

Resolution: NLT 1.4 between the paracresol and metacresol peaks, System suitability solution

Signal-to-noise ratio: NLT 10, Sensitivity solution

Analysis

Sample: Sample solution

Calculate the percentage of each individual impurity in the portion of Metacresol taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak area of each individual impurity from the Sample solution

r_T = sum of all the peak areas from the Sample solution

Acceptance criteria: See Table 3. Disregard any peak less than 0.05%.

Table 3

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Orthocresol	0.85	0.5
Paracresol	0.99	0.5
Metacresol	1.00	—
Any unspecified impurity	—	0.1
Total impurities	—	1.0

SPECIFIC TESTS

• CLARITY OF SOLUTION

A.

Analysis: Add 10 mL of Metacresol to 10 mL of hexane, and mix.

Acceptance criteria: A clear solution is obtained.

B.

Analysis: Add 1.0 mL of Metacresol to 20 mL of 1 N sodium hydroxide, and mix.

Acceptance criteria: A clear solution is obtained.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Metacresol RS

USP Phenol RS

Phenol.

C_6H_6O 94.11

Metaproterenol Sulfate

$(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$ 520.59

1,3-Benzenediol, 5-[1-hydroxy-2-(1-methylethyl)amino]-ethyl-, (\pm)-, sulfate (2:1) (salt).

(\pm)-3,5-Dihydroxy- α -[(isopropylamino)methyl]benzyl alcohol sulfate (2:1) [5874-97-5].

» Metaproterenol Sulfate contains not less than 98.0 percent and not more than 102.0 percent of $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$, calculated on the anhydrous, isopropyl alcohol-free, and methanol-free basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Metaproterenol Sulfate RS

Identification—**A:** *Infrared Absorption* (197K).**B:** To a solution of 10 mg in 1 mL of water add 1 drop of ferric chloride TS: a violet color is produced.**C:** It responds to the tests for *Sulfate* (191).**D:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for metaproterenol, the retention time of which corresponds with that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.**pH** (791): between 4.0 and 5.5, in a solution containing 100 mg per mL.**Water Determination, Method I** (921): not more than 2.0%.**Residue on ignition** (281): not more than 0.1%.**Delete the following:****•Heavy metals, Method II** (231): 0.001%. (Official 1-Jan-2018)**Iron** (241)—Dissolve 2.0 g in 45 mL of water, add 2 mL of hydrochloric acid, and mix: the limit is 5 ppm.**Limit of metaproterenone sulfate**—Its absorptivity (see *Ultraviolet-Visible Spectroscopy* (857)) at 328 nm, determined in an aqueous solution containing 9.0 mg per mL, is not more than 0.009 (0.1%).**Isopropyl alcohol and methanol—****Isopropyl alcohol standard solution**—Transfer about 0.3 g of isopropyl alcohol, accurately weighed, to a 100-mL volumetric flask containing about 10 mL of water, dilute with water to volume, and mix. Pipet 10 mL of the resulting solution into a 100-mL volumetric flask, add about 85 mL of pyridine, mix, and allow to stand for 1 hour. Dilute with pyridine to volume, and mix. Pipet 5 mL of this solution to a 50-mL volumetric flask, dilute with pyridine to volume, and mix. The solution so obtained contains about 30 µg of isopropyl alcohol per mL.**Methanol standard solution**—Prepare as directed for *Isopropyl alcohol standard solution*, using about 0.1 g of methanol, accurately weighed. The resulting solution contains about 10 µg of methanol per mL.**Test preparation**—Transfer about 1 g of Metaproterenol Sulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in about 2 mL of water, dilute with pyridine to volume, and mix.**Chromatographic system**—The gas chromatograph is equipped with a flame-ionization detector and contains a 2-m × 2-mm column packed with 0.1% liquid phase G25 on 80- to 100-mesh support S7. The injection port is maintained at a temperature of about 150°; the column is programmed for 2 minutes at 40°, to increase at a rate of about 15° per minute to 200°, and for 10 minutes at 200°; the detector is maintained at about 250°; and helium is used as the carrier gas at a flow rate of about 15 mL per minute.**Procedure**—Inject equal volumes (about 2 µL) of the *Test preparation*, the *Isopropyl alcohol standard solution*, and the *Methanol standard solution* successively into the gas chromatograph. Measure the responses of the isopropyl alcohol peak and the methanol peak in each chromatogram. Determine the quantities, in mg, of isopropyl alcohol and methanol in the portion of Metaproterenol Sulfate taken by the formula:

$$0.1C(r_u / r_s)$$

in which *C* is the concentration, in µg per mL, of isopropyl alcohol or methanol in the *Isopropyl alcohol standard solution* or the *Methanol standard solution*; and *r_u* and *r_s* are the re-sponses of the respective analytes in the *Test preparation* and of the corresponding *Isopropyl alcohol standard solution* or *Methanol standard solution*: not more than 0.3% of isopropyl alcohol and not more than 0.1% of methanol are found.**Assay—****Mobile phase**—Dissolve 11.9 g of anhydrous dibasic sodium phosphate in water to make 1000 mL of solution, and mix (*Solution A*). Dissolve 9.1 g of monobasic potassium phosphate in water to make 1000 mL of solution, and mix (*Solution B*). Mix 735 mL of *Solution A* and 140 mL of *Solution B*, add 125 mL of methanol, and mix. Filter and degas this solution before use.**Standard preparation**—Dissolve an accurately weighed quantity of USP Metaproterenol Sulfate RS in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 2 mg per mL.**Assay preparation**—Transfer about 100 mg of Metaproterenol Sulfate, accurately weighed, to a 50-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector and a 4.6-mm × 5-cm guard column that contains packing L7 and a 4.6-mm × 25-cm analytical column that contains 10-µm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 500 theoretical plates, the tailing factor for the analyte peak is not more than 3.0, and the relative standard deviation for replicate injections is not more than 2.0%.**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of (C₁₁H₁₇NO₃)₂ · H₂SO₄ in the portion of Metaproterenol Sulfate taken by the formula:

$$50C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Metaproterenol Sulfate RS in the *Standard preparation*, and *r_u* and *r_s* are the peak responses from the *Assay preparation* and the *Standard preparation*, respectively.**Metaproterenol Sulfate Inhalation Aerosol**» Metaproterenol Sulfate Inhalation Aerosol is a suspension of microfine Metaproterenol Sulfate in fluorochlorohydrocarbon propellants in a pressurized container. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metaproterenol sulfate [(C₁₁H₁₇NO₃)₂ · H₂SO₄].**Packaging and storage**—Preserve in small, nonreactive, light-resistant aerosol containers equipped with metered-dose valves and provided with oral inhalation actuators.**USP Reference standards (11)—**

USP Metaproterenol Sulfate RS

Identification—The UV absorption spectrum of the solution from the *Assay preparation*, obtained as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of the *Standard preparation* prepared as directed in the *Assay*.

Delivered dose uniformity over the entire contents: meets the requirements for *Metered-Dose Inhalers* under *Aerosols, Nasal Sprays, Metered-Dose Inhalers, and Dry Powder Inhalers* (601).

PROCEDURE FOR DOSE UNIFORMITY—

Standard preparation—Using a suitable quantity of USP Metaproterenol Sulfate RS, accurately weighed, prepare a solution in 0.01 N hydrochloric acid to obtain a solution having a known concentration of 0.05 mg per mL.

Test preparation—Discharge the minimum recommended dose into the sampling apparatus and detach the inhaler as directed. Rinse the apparatus (filter and interior) with four 5.0-mL portions of 0.01 N hydrochloric acid, and quantitatively transfer the rinsings to a 25-mL volumetric flask. Dilute with 0.01 N hydrochloric acid to volume, and mix.

Procedure—Transfer 20.0 mL portions of the *Standard preparation*, the *Test preparation*, and 0.01 N hydrochloric acid to serve as a blank to separate centrifuge tubes. Add 10.0 mL of chloroform to each, shake by mechanical means for 5 minutes, and separate the layers by centrifuging for 5 minutes. Determine the absorbances of the respective aqueous layers in 1-cm cells, at the wavelength of maximum absorbance at about 276 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ contained in the minimum dose taken by the formula:

$$12.5CN(A_U / A_S)$$

in which *C* is the concentration, in mg per mL, of USP Metaproterenol Sulfate RS in the *Standard preparation*; *N* is the number of sprays discharged to obtain the minimum dose; and *A_U* and *A_S* are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

Particle size—Prime the valve of an Inhalation Aerosol container by alternately shaking and firing it several times, and then actuate one measured spray onto a clean, dry microscope slide held 5 cm from the end of the oral inhalation actuator, perpendicular to the direction of the spray. Carefully rinse the slide with about 2 mL of chloroform, and allow to dry. Examine the slide under a microscope equipped with a calibrated ocular micrometer, using 450× magnification. Focus on the particles of 25 fields of view near the center of the test specimen pattern, and note the size of the great majority of individual particles: they are less than 5 μm along the longest axis. Record the number and size of all individual crystalline particles (not agglomerates) more than 10 μm in length measured along the longest axis: not more than 10 such particles are observed.

Water—Transfer the contents of a weighed container to the titration vessel by attaching the valve stem to an inlet tube. Weigh the empty container and determine the weight of the specimen taken. The water content, determined by *Method I* under *Water Determination* (921), is not more than 0.075%.

Assay—Cool an accurately weighed Inhalation Aerosol container for 10 minutes in a bath consisting of a mixture of acetone and solid carbon dioxide. Cut the valve from the aerosol container and allow the container to warm to room temperature. When most of the propellants have evaporated, transfer the residue in the container to a 250-mL separator with the aid of 30 mL of chloroform and 50 mL of 0.01 N hydrochloric acid. Reserve the valve and the empty container. Shake the separator for 1 minute and allow the phases to separate. Transfer the chloroform phase to a second 250-mL separator and the aqueous phase to a 250-mL volumetric flask. Wash the chloroform phase with two 50-mL portions of 0.01 N hydrochloric acid, add the washings to the 250-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Transfer an accurately measured volume of this stock solution, equivalent to about 10 mg of metaproterenol sulfate, to a 100-mL volumetric

flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Dissolve an accurately weighed quantity of USP Metaproterenol Sulfate RS in 0.01 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 100 μg per mL. Concomitantly determine the absorbances of both solutions at the wavelength of maximum absorbance at about 276 nm, with a suitable spectrophotometer, using 0.01 N hydrochloric acid as the blank. Rinse the empty aerosol container and the valve with water and dry them at 105° for 10 minutes, allow to cool, and weigh. Subtract the weight thus obtained from the original weight of the Inhalation Aerosol container to obtain the weight of the Inhalation Aerosol taken. Calculate the quantity, in mg, of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ in each mL of the Inhalation Aerosol taken by the formula:

$$25(C/V)(d/W)(A_U/A_S)$$

in which *C* is the concentration, in μg per mL, of USP Metaproterenol Sulfate RS in the Standard solution, *V* is the volume, in mL, of stock solution taken, *W* is the weight, in g, of the Inhalation Aerosol taken, and *A_U* and *A_S* are the absorbances of the solution from the Inhalation Aerosol and the Standard solution, respectively. [The density, *d*, is determined as follows: Weigh a known volume (*v*) of the Inhalation Aerosol in a suitable 5-mL gas-tight syringe equipped with a linear valve. Calibrate the volume of the syringe by filling to the 5-mL mark with dichlorotetrafluoroethane withdrawn from a plastic-coated glass vial sealed with a neoprene multiple-dose rubber stopper and an aluminum seal, using 1.456 g per mL as the density of the calibrating liquid. Maintain the dichlorotetrafluoroethane, the Inhalation Aerosol sample, and the syringe (protected from becoming wet) at 25° in a water bath. Obtain the sample, equivalent to the same volume as that obtained during the sampling procedure, from the Inhalation Aerosol by means of a sampling device consisting of a replaceable rubber septum engaged in the plate threads at one end of a threaded fitting, the opposite end of which contains a sharpened tube capable of puncturing the aerosol container, and a rubber gasket around the tube to prevent leakage of the container contents after puncture.* Calculate the density taken by the formula:

$$w/v$$

in which *w* is the weight of the volume, *v*, of the Inhalation Aerosol taken.]

Metaproterenol Sulfate Inhalation Solution

» Metaproterenol Sulfate Inhalation Solution is a sterile solution of Metaproterenol Sulfate in Purified Water. It may contain Sodium Chloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$.

Packaging and storage—Store in small, tight containers that are well-filled or otherwise protected from oxidation. Protect from light.

Labeling—Label it to indicate that the Inhalation Solution is not to be used if its color is pinkish or darker than slightly yellow or if it contains a precipitate.

* A suitable sampling system is available from Alltek Associates, P. O. Box 498, Arlington Heights, IL 60006.

USP Reference standards (11)—

USP Metaproterenol Sulfate RS

Color and clarity—

Standard solution—Transfer 2.0 mL of 0.100 N iodine VS to a 500-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Visually examine a portion of the Inhalation Solution (*Test solution*) in a suitable clear glass test tube against a white background: it is not pinkish, and it contains no precipitate. If any yellow color is observed in the *Test solution*, concomitantly determine the absorbances of the *Test solution* and the *Standard solution* in 1-cm cells with a suitable spectrophotometer set at 460 nm: the absorbance of the *Test solution* does not exceed that of the *Standard solution*.

Identification—

A: Apply 4 μ L of the Inhalation Solution and 4 μ L of an aqueous solution of USP Metaproterenol Sulfate RS containing about 50 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of the upper layer of a freshly prepared mixture of butyl alcohol, water, and formic acid (50:25:7) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the R_f value of the principal spot obtained from the Inhalation Solution corresponds to that obtained from the *Standard solution*.

B: The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for metaproterenol, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

Sterility Tests (71): meets the requirements.

pH (791): between 2.8 and 4.0.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the *Assay* under *Metaproterenol Sulfate*.

Assay preparation—Transfer an accurately measured volume of Inhalation Solution, equivalent to about 200 mg of metaproterenol sulfate, to a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix.

Procedure—Proceed as directed for *Procedure* in the *Assay* under *Metaproterenol Sulfate*. Calculate the quantity, in mg, of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ in each mL of the Inhalation Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which V is the volume, in mL, of Inhalation Solution taken; and C , r_U , and r_S are as defined therein.

Metaproterenol Sulfate Oral Solution

» Metaproterenol Sulfate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Metaproterenol Sulfate RS

Identification—

A: Transfer a portion of Oral Solution, equivalent to about 10 mg of metaproterenol sulfate, to a separator, and extract with four 30-mL portions of ether, discarding the ether extracts. Apply 10 μ L of the extracted portion of Oral Solution to the lower right corner of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow to dry. Develop the chromatogram in a solvent system consisting of the lower layer of a well-shaken mixture of dioxane, methylene chloride, alcohol, and ammonium hydroxide (4:4:1:1). Allow the solvent front to move about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry in vacuum at 35° to 40° for 30 minutes. Rotate the plate 90°. At a point about four-fifths of the distance between the initial application of the Oral Solution extract and the solvent front, apply 10 μ L of a *Standard solution* of USP Metaproterenol Sulfate RS in water containing about 2 mg per mL. Proceed as directed in *Identification* test A under *Metaproterenol Sulfate Inhalation Solution*, beginning with "Allow the spots to dry": the R_f value of the principal spot obtained from the Oral Solution corresponds to that obtained from the *Standard solution*.

B: The retention time of the major peak for metaproterenol in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

pH (791): between 2.5 and 4.0, in a solution obtained by mixing 1 volume of Oral Solution and 4 volumes of water.

Assay—

Mobile phase—Mix 10 mL of formic acid and water to make 1000 mL of solution. Filter and degas this solution before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Metaproterenol Sulfate RS in water to obtain a solution having a known concentration of about 0.2 mg per mL.

Assay preparation—Transfer an accurately measured volume of Oral Solution, equivalent to about 20 mg of metaproterenol sulfate, to a 100-mL volumetric flask, dilute with water to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 278-nm detector, a 4.6-mm \times 5-cm guard column that contains packing L2, and a 3.9-mm \times 30-cm analytical column that contains packing L1. [NOTE—After use, rinse the analytical column with water and store with water in it.] The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 100 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ in each mL of the Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Metaproterenol Sulfate RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and r_U and r_S are the peak responses from the *Assay preparation* and the *Standard preparation*, respectively.

Metaproterenol Sulfate Tablets

» Metaproterenol Sulfate Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Metaproterenol Sulfate RS

Identification—

A: Powder a number of Tablets, equivalent to about 100 mg of metaproterenol sulfate, add 10 mL of water, stir for about 3 minutes, and centrifuge. Use the clear solution so obtained as the *Test solution*. Dissolve a suitable quantity of USP Metaproterenol Sulfate RS in water to obtain a Standard solution having a concentration of 10 mg per mL. Apply separate 10- μ L portions of the *Test solution* and the Standard solution to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Proceed as directed in Identification test A under Metaproterenol Sulfate Inhalation Solution, beginning with "Allow the spots to dry": the R_f value of the principal spot obtained from the *Test solution* corresponds to that obtained from the Standard solution.

B: Mix a quantity of powdered Tablets, equivalent to about 20 mg of metaproterenol sulfate, with 5 mL of water, and filter: the filtrate responds to the tests for Sulfate (191).

C: The chromatogram of the Assay preparation obtained as directed in the Assay exhibits a major peak for metaproterenol, the retention time of which corresponds to that exhibited in the chromatogram of the Standard preparation obtained as directed in the Assay.

Dissolution (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Procedure—Determine the amount of $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 276 nm of filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Metaproterenol Sulfate RS in the same Medium.

Tolerances—Not less than 70% (Q) of the labeled amount of $(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase, Standard preparation, and Chromatographic system—Prepare as directed in the Assay under Metaproterenol Sulfate.

Assay preparation—Transfer 20 Tablets to a 500-mL conical flask. Add an accurately measured volume of 0.01 N hydrochloric acid sufficient to yield a solution containing about 2 mg of metaproterenol sulfate per mL, shake by mechanical means for 30 minutes, and filter. Use the filtrate so obtained as the Assay preparation.

Procedure—Proceed as directed for Procedure in the Assay under Metaproterenol Sulfate. Calculate the quantity, in mg, of metaproterenol sulfate $[(C_{11}H_{17}NO_3)_2 \cdot H_2SO_4]$ in each Tablet taken by the formula:

$$(CV/20)(r_u/r_s)$$

in which V is the volume, in mL, of 0.01 N hydrochloric acid added; and C , r_u , and r_s are as defined therein.

Metaraminol Bitartrate

$C_9H_{13}NO_2 \cdot C_4H_6O_6$ 317.29

Benzenemethanol, α -(1-aminoethyl)-3-hydroxy-, [R -(R^* , S^*)]-, [R -(R^* , R^*)]-2,3-dihydroxybutanedioate (1:1) (salt).

(-)- α -(1-Aminoethyl)- m -hydroxybenzyl alcohol tartrate (1:1) (salt) [33402-03-8].

» Metaraminol Bitartrate contains not less than 99.0 percent and not more than 100.5 percent of $C_9H_{13}NO_2 \cdot C_4H_6O_6$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Metaraminol Bitartrate RS

Identification—

A: Infrared Absorption (197K).

B: To 0.5 mL of a solution (1 in 2000) add 1 mL of Folin-Ciocalteu phenol TS, then add 5 mL of sodium carbonate solution (1 in 10), mix, and allow to stand for 5 minutes: an intense blue color appears (*presence of a phenol*).

C: To 4 mL of a solution (1 in 2000) add 5 mL of pH 9.6 alkaline borate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*), then add about 5 mg of β -naphthoquinone-4-sodium sulfonate, mix until dissolved, and allow to stand for 5 minutes. Add 0.2 mL of benzalkonium chloride solution (1 in 100), mix, add 5 mL of toluene, and shake: the toluene layer turns purple immediately (*distinction from phenylephrine*).

Melting range (741): between 171° and 175°.

Specific rotation (781S): between -31.5° and -33.5° (λ =405 nm).

Test solution: 100 mg per mL, in 0.5 N hydrochloric acid.

pH (791): between 3.2 and 3.5, in a solution (1 in 20).

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method I** (231): 0.002%. • (Official 1-Jan-2018)

Assay—Dissolve about 600 mg of Metaraminol Bitartrate, accurately weighed, in 20 mL of glacial acetic acid, warming slightly to effect solution. Cool the solution to room temperature, add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to an emerald-green color. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.73 mg of $C_9H_{13}NO_2 \cdot C_4H_6O_6$.

Metaraminol Bitartrate Injection

» Metaraminol Bitartrate Injection is a sterile solution of Metaraminol Bitartrate in Water for Injection. It contains, in each mL, an amount of metaraminol bitartrate equivalent to not less than 9.0 mg and not more than 11.0 mg of metaraminol ($C_9H_{13}NO_2$).

Packaging and storage—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

USP Reference standards (11)—

USP Endotoxin RS
USP Metaraminol Bitartrate RS

Identification—

A: Evaporate a 1-mL portion to dryness: the residue so obtained meets the requirements for *Identification test A* under *Metaraminol Bitartrate*.

B: It meets the requirements for *Identification tests B* and *C* under *Metaraminol Bitartrate*.

Bacterial Endotoxins Test (85)—It contains not more than 3.5 USP Endotoxin Units per mg of metaraminol.

pH (791): between 3.2 and 4.5.

Particulate Matter in Injections (788): meets the requirements for small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

0.0032 M Hexanesulfonate buffer—Mix 600 mg of sodium 1-hexanesulfonate with water to obtain 1000 mL of solution, adjust with phosphoric acid to a pH of 3.0 ± 0.05 , and filter.

Mobile phase—Prepare a suitable degassed and filtered mixture of methanol and **0.0032 M Hexanesulfonate buffer** (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Metaraminol Bitartrate RS in water to obtain a solution having a known concentration of about 0.2 mg of metaraminol per mL.

Assay preparation—Transfer an accurately measured volume of injection, equivalent to about 20 mg of metaraminol, to a 100-mL volumetric flask, dilute with water to volume, and mix.

System suitability preparation—Prepare a solution of propylparaben in alcohol containing 0.4 mg per mL. Mix 1 volume of this solution with 99 volumes of the *Standard preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 264-nm detector and a 4-mm \times 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability preparation* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2600 theoretical plates, the resolution, R , between the metaraminol bitartrate and propylparaben peaks is not less than 3.0 with propylparaben eluting first, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of metaraminol ($C_9H_{13}NO_2$) in each mL of the injection taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which C is the concentration, in mg per mL, of metaraminol represented by the USP Metaraminol Bitartrate RS in the *Standard preparation*; V is the volume, in mL, of injection taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Metaxalone

$C_{12}H_{15}NO_3$ 221.25
2-Oxazolidinone, 5-[(3,5-dimethylphenoxy)methyl]-;
5-[(3,5-Xylyloxy)methyl]-2-oxazolidinone;
5-[(3,5-Dimethylphenoxy)methyl]-1,3-oxazolidin-2-one
[1665-48-1].

DEFINITION

Metaxalone contains NLT 98.0% and NMT 102.0% of metaxalone ($C_{12}H_{15}NO_3$), calculated on dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197A) or (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Sample solution*, as obtained in the *Assay*.

ASSAY

• **PROCEDURE**

Buffer: 0.68 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 4.5.

Mobile phase: Methanol and *Buffer* (50:50)

Standard stock solution: 0.5 mg/mL of USP Metaxalone RS prepared as follows. Transfer a suitable quantity of USP Metaxalone RS to a suitable volumetric flask. Add 50% of the flask volume of methanol. Sonicate for 5 min to dissolve. Add 40% of the flask volume of *Buffer*, and mix. Cool to room temperature. Dilute with *Buffer* to volume.

Standard solution: 0.05 mg/mL of USP Metaxalone RS from the *Standard stock solution* in *Mobile phase*

Sample stock solution: 0.5 mg/mL of Metaxalone prepared as follows. Transfer a suitable quantity of Metaxalone to a suitable volumetric flask. Add 50% of the flask volume of methanol. Sonicate for 5 min to dissolve. Add 40% of the flask volume of *Buffer*, and mix. Cool to room temperature. Dilute with *Buffer* to volume.

Sample solution: 0.05 mg/mL of Metaxalone from the *Sample stock solution* in *Mobile phase*

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 226 nm

Column: 4.6-mm \times 15-cm; 5- μ m packing L1

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μ L

Run time: NLT 2 times the retention time of metaxalone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of metaxalone ($C_{12}H_{15}NO_3$) in the portion of Metaxalone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Metaxalone RS in the *Standard solution* (mg/mL)

C_U = concentration of Metaxalone in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.30%

• ORGANIC IMPURITIES, PROCEDURE 1

If metaxalone related compound B, metaxalone related compound C, or *N*-benzyl metaxalone is a known process impurity, *Organic Impurities, Procedure 2* is recommended.

Solution A: 0.1% Trifluoroacetic acid in water

Solution B: 0.1% Trifluoroacetic acid in acetonitrile

Mobile phase: See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
10.0	65	35
11.0	75	25
15.0	75	25

Diluent: Acetonitrile and water (75:25)

System suitability solution: 4 mg/mL of USP Metaxalone RS and 0.01 mg/mL of 3,5-dimethylphenol in *Diluent*

Sensitivity solution: 0.002 mg/mL of USP Metaxalone RS in *Diluent*

Sample solution: 4 mg/mL of Metaxalone in *Diluent*

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 273 nm

Column: 4.6-mm × 25-cm; 5-μm packing L68

Flow rate: 2.0 mL/min

Injection volume: 10 μL

System suitability

Samples: *System suitability solution* and *Sensitivity solution*

[NOTE—See *Table 2* for the relative retention times.]

Suitability requirements

Resolution: NLT 2.0 between metaxalone and 3,5-dimethylphenol, *System suitability solution*

Signal-to-noise ratio: NLT 10, *Sensitivity solution*

Analysis

Sample: *Sample solution*

Calculate the percentage of each impurity in the portion of Metaxalone taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_T = sum of the peak responses of metaxalone and impurities from the *Sample solution*

Acceptance criteria: See *Table 2*. Disregard any impurity peaks less than 0.03%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Metaxalone	1.0	—
3,5-Dimethylphenol	1.1	0.05
Any individual unspecified impurity	—	0.05
Total impurities	—	0.50

• ORGANIC IMPURITIES, PROCEDURE 2

If metaxalone related compound B, metaxalone related compound C, or *N*-benzyl metaxalone is a known pro-

cess impurity, *Organic Impurities, Procedure 2* is recommended. If the article complies with *Procedure 2*, the labeling indicates that it meets *Organic Impurities, Procedure 2*.

Buffer, Mobile phase, and Standard stock solution: Proceed as directed in the *Assay*.

Standard solution: 0.001 mg/mL of USP Metaxalone RS from the *Standard stock solution* in *Mobile phase*

Impurity stock solution: 0.2 mg/mL each of USP Metaxalone Related Compound B RS and USP Metaxalone Related Compound C RS in methanol. Sonicate to dissolve if necessary.

Peak identification solution: 1 mg/mL of USP Metaxalone RS and 0.02 mg/mL each of USP Metaxalone Related Compound B RS and USP Metaxalone Related Compound C RS prepared as follows. Transfer a suitable quantity of USP Metaxalone RS to a suitable volumetric flask. Add 50% of the flask volume of methanol, and sonicate to dissolve. Transfer suitable volumes of *Impurity stock solution* to the flask. Dilute with *Buffer* to volume.

Sample solution: 2.0 mg/mL of Metaxalone prepared as follows. Transfer a suitable quantity of Metaxalone to a suitable volumetric flask. Add 50% of the flask volume of methanol. Sonicate for 5 min to dissolve. Add 40% of the flask volume of *Buffer*, and mix. Cool to room temperature. Dilute with *Buffer* to volume.

Chromatographic system
(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 226 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 8 times the retention time of metaxalone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 10.0%

Signal-to-noise ratio: NLT 25

Analysis

Samples: *Standard solution* and *Sample solution*

Use the *Peak identification solution* to identify the peaks. Calculate the percentage of each impurity in the portion of Metaxalone taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of metaxalone from the *Standard solution*

C_S = concentration of USP Metaxalone RS in the *Standard solution* (mg/mL)

C_U = concentration of Metaxalone in the *Sample solution* (mg/mL)

F = relative response factor for the corresponding impurity (see *Table 3*)

Acceptance criteria: See *Table 3*. Disregard any impurity peaks less than 0.03%.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Metaxalone related compound B	0.35	1.0	0.05
Metaxalone	1.0	—	—

* 3-Benzyl-5-[(3,5-dimethylphenoxy)methyl]oxazolidin-2-one.

Table 3 (Continued)

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Metaxalone related compound C	3.6	1.0	0.05
N-Benzylmetaxalone ^a	6.9	0.64	0.05
Any individual unspecified impurity	—	1.0	0.05
Total impurities	—	—	0.3

^a 3-Benzyl-5-[(3,5-dimethylphenoxy)methyl]oxazolidin-2-one.

SPECIFIC TESTS• **LOSS ON DRYING** (731)

Analysis: Dry at 90° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** The label states with which *Organic Impurities* procedure the article complies if *Organic Impurities, Procedure 1* is not used.
- **USP REFERENCE STANDARDS** (11)
 - USP Metaxalone RS
 - USP Metaxalone Related Compound B RS
 - 1-Amino-3-(3,5-dimethylphenoxy)propan-2-ol.
C₁₁H₁₇NO₂ 195.26
 - USP Metaxalone Related Compound C RS
 - Bis[2-hydroxy-3-(3,5-dimethylphenoxy)propyl]amine.
C₂₂H₃₁NO₄ 373.49

Metaxalone Tablets**DEFINITION**

Metaxalone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metaxalone (C₁₂H₁₅NO₃).

IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY• **PROCEDURE**

Buffer: 0.68 g/L of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 4.5.

Mobile phase: Methanol and *Buffer* (50:50)

Standard stock solution: 0.5 mg/mL of USP Metaxalone RS prepared as follows. Transfer a suitable amount of USP Metaxalone RS to a suitable volumetric flask. Add 50% of the flask volume of methanol and sonicate to dissolve. Dilute with *Buffer* to volume.

Standard solution: 0.05 mg/mL of USP Metaxalone RS from *Standard stock solution* in *Mobile phase*.

Sample stock solution: Nominally 1.0 mg/mL of metaxalone from NLT 20 Tablets prepared as follows. Transfer a portion of finely powdered Tablets equivalent to NLT 500 mg of metaxalone to a suitable volumetric flask. Add 50% of the flask volume of methanol and sonicate for 10 min with occasional swirling. Shake on a mechanical shaker for 15 min. Add 40% of the flask volume of *Buffer* and allow the solution to cool to room temperature. Dilute with *Buffer* to volume. Pass a portion of the solution through a PVDF filter of 0.45-μm pore size. Discard the first 5 mL. Use the filtrate.

Sample solution: Nominally 0.05 mg/mL of metaxalone from *Sample stock solution* and *Mobile phase*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 226 nm

Column: 4.6-mm × 15-cm; 5-μm packing L1

Column temperature: 50°

Flow rate: 1 mL/min

Injection volume: 20 μL

Run time: NLT 2 times the retention time of metaxalone

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Relative standard deviation: NMT 0.73%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metaxalone (C₁₂H₁₅NO₃) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of metaxalone from the *Sample solution*

r_S = peak response of metaxalone from the *Standard solution*

C_S = concentration of USP Metaxalone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metaxalone in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS• **DISSOLUTION** (711)

Medium: 0.5% sodium lauryl sulfate; 900 mL

Apparatus 2: 100 rpm

Time: 60 min

Buffer, Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the *Assay*, except use 270 nm for analysis.

Standard solution: (L/900) mg/mL of USP Metaxalone RS, where L is the label claim of metaxalone, in mg/ Tablet, prepared as follows. Transfer a suitable quantity of USP Metaxalone RS to a suitable volumetric flask. Add 4% of the flask volume of methanol, sonicate to dissolve, and dilute with *Medium* to volume.

Sample solution: Pass a portion of the solution under test through a suitable PVDF membrane filter of 0.45-μm pore size. Discard the first 5 mL of the filtrate and use the remaining amount for analysis.

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metaxalone (C₁₂H₁₅NO₃) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Metaxalone RS in the *Standard solution* (mg/mL)

V = volume of the *Medium*, 900 mL

L = label claim of metaxalone (mg/Tablet)

Tolerances: NLT 60% (Q) of the labeled amount of metaxalone (C₁₂H₁₅NO₃) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

• **ORGANIC IMPURITIES**

Buffer, Mobile phase, Standard solution, and Chromatographic system: Proceed as directed in the *Assay*.

Impurity stock solution: 0.2 mg/mL each of USP Metaxalone Related Compound B RS and USP Metax-

alone Related Compound C RS in methanol. Sonicate to dissolve if necessary.

Peak identification solution: 1 mg/mL of USP Metaxalone RS and 0.02 mg/mL each of USP Metaxalone Related Compound B RS and USP Metaxalone Related Compound C RS prepared as follows. Transfer a suitable quantity of USP Metaxalone RS to a suitable volumetric flask. Add 50% of the flask volume of methanol and sonicate to dissolve. Transfer suitable volumes of *Impurity stock solution* to the flask. Dilute with *Buffer* to volume.

Sensitivity solution: 0.5 µg/mL of USP Metaxalone RS from *Standard solution* and *Mobile phase*

Sample solution: Nominally 1.0 mg/mL of metaxalone prepared from NLT 20 Tablets as follows. Transfer a portion of NLT 20 finely powdered Tablets equivalent to NLT 500 mg of metaxalone to a suitable volumetric flask. Add 50% of the flask volume of methanol and sonicate for 10 min with occasional swirling. Shake on a mechanical shaker for 15 min. Add 40% of the flask volume of *Buffer* and cool to room temperature. Dilute with *Buffer* to volume. Pass a portion of the solution through a PVDF filter of 0.45-µm pore size. Discard the first 5 mL.

System suitability

Samples: *Peak identification solution* and *Sensitivity solution*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Tailing factor: NMT 2.0, *Sensitivity solution*

Relative standard deviation: NMT 10.0% for the metaxalone peak, *Sensitivity solution*

Signal-to-noise ratio: NLT 25 for the metaxalone peak, *Sensitivity solution*

Analysis

Samples: *Standard solution*, *Peak identification solution*, and *Sample solution*

Use the *Peak identification solution* to identify the peaks. Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each degradation product from the *Sample solution*

r_S = peak response of metaxalone from the *Standard solution*

C_S = concentration of USP Metaxalone RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metaxalone in the *Sample solution* (mg/mL)

Acceptance criteria: See *Table 1*.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)

Metformin Hydrochloride

$C_4H_{11}N_5 \cdot HCl$ 165.62
Imidodicarbonimidic diamide, *N,N*-dimethyl-, monohydrochloride;
1,1-Dimethylbiguanide monohydrochloride [1115-70-4].

DEFINITION

Metformin Hydrochloride contains NLT 98.5% and NMT 101.0% of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION (197K)**

• **B. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

ASSAY

• PROCEDURE

Sample: 60 mg of Metformin Hydrochloride

Analysis

[NOTE—To avoid overheating of the reaction medium, mix thoroughly throughout the titration, and stop the titration immediately after the endpoint has been reached.]

Dissolve the *Sample* in 4 mL of anhydrous formic acid, and add 50 mL of acetic anhydride. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 8.28 mg of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

Acceptance criteria: 98.5%–101.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method I** (231): NMT 10 ppm (Official).

(Jan-2018)

ORGANIC IMPURITIES

Mobile phase: 17 g/L of monobasic ammonium phosphate in water, adjusted with phosphoric acid to a pH of 3.0

System suitability stock solution: 0.25 mg/mL of metformin hydrochloride and 0.1 mg/mL of melamine in water

System suitability solution: Transfer 1.0 mL of the System suitability stock solution to a 50-mL volumetric flask, and dilute with Mobile phase to volume.

Standard stock solution: 0.2 mg/mL of USP Metformin Related Compound A RS in water

Standard solution: 0.001 mg/mL of USP Metformin Related Compound A RS in Mobile phase from the Standard stock solution

Sample solution: 5 mg/mL of Metformin Hydrochloride in Mobile phase

Diluted sample solution: 0.005 mg/mL of Metformin Hydrochloride in Mobile phase from the Sample solution

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 218 nm

Column: 4.6-mm × 25-cm; packing L9

Flow rate: 1.0–1.7 mL/min

Run time: NLT twice the retention time of metformin

Injection volume: 20 µL

System suitability

Sample: System suitability solution

Suitability requirements

Resolution: NLT 10 between melamine and metformin

Analysis

Samples: Standard solution, Sample solution, and Diluted sample solution

Calculate the percentage of metformin related compound A in the portion of Metformin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of metformin related compound A from the Sample solution

r_S = peak response of metformin related compound A from the Standard solution

C_S = concentration of USP Metformin Related Compound A RS in the Standard solution (mg/mL)

C_U = concentration of Metformin Hydrochloride in the Sample solution (mg/mL)

Calculate the percentage of any other impurity in the portion of Metformin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times D \times 100$$

r_U = peak response of an individual impurity from the Sample solution

r_S = peak response of metformin from the Diluted sample solution

D = dilution factor for the preparation of the Diluted sample solution, 0.001

Acceptance criteria

Individual impurities: NMT 0.02% for metformin related compound A; NMT 0.1% for any other impurity

Total impurities: NMT 0.5%

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 5 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.

- **USP REFERENCE STANDARDS** (11)

USP Metformin Hydrochloride RS

USP Metformin Related Compound A RS

1-Cyanoguanidine.

$C_2H_4N_4$ 84.08

Metformin Hydrochloride Tablets

DEFINITION

Metformin Hydrochloride Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

Sample: Transfer an amount of powdered Tablets, equivalent to 20 mg of metformin hydrochloride, to a suitable flask. Add 20 mL of dehydrated alcohol, and shake. Filter, evaporate the filtrate on a water bath to dryness, and dry the residue at 105° for 2 h.

Acceptance criteria: Meet the requirements

- **B.**

Solution A: Dissolve 1 g of 1-naphthol in a solution containing 6 g of sodium hydroxide and 16 g of anhydrous sodium carbonate in 100 mL of water.

Sample solution: Triturate an amount of powdered Tablets, equivalent of 50 mg of metformin hydrochloride, with 10 mL of water, filter, and use the filtrate.

Analysis: To 5 mL of the Sample solution add 1.5 mL of 5 N sodium hydroxide solution and 1 mL of Solution A. Add 0.5 mL of sodium hypochlorite TS, dropwise, and with shaking.

Acceptance criteria: An orange-red color is produced that darkens on standing.

- **C. IDENTIFICATION TESTS—GENERAL, Chloride** (191)

Sample solution: Prepare as directed for the Sample solution in Identification test B.

Acceptance criteria: Meet the requirements

ASSAY

- **PROCEDURE**

Standard solution: 10 µg/mL of USP Metformin Hydrochloride RS in water

Sample solution: Weigh and finely powder NLT 20 Tablets. Transfer the amount of powder, equivalent to 100 mg of metformin hydrochloride, to a 100-mL volumetric flask. Add 70 mL of water, shake by mechanical means for 15 min, dilute with water to volume, and filter, discarding the first 20 mL of the filtrate. Dilute 10.0 mL of the filtrate with water to 100.0 mL, and dilute 10.0 mL of the resulting solution with water to 100.0 mL. The nominal concentration of this solution is 10 µg/mL.

Instrumental conditions

(See Ultraviolet-Visible Spectroscopy (857).)

Mode: UV

Analytical wavelength: Wavelength of maximum absorbance at about 232 nm

Cell: 1 cm
Blank: Water

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) in the portion of the Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* ($\mu\text{g/mL}$)
 C_U = nominal concentration of metformin hydrochloride in the *Sample solution* ($\mu\text{g/mL}$)
Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: Wavelength of maximum absorbance at about 233 nm

Analysis: Determine the amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved by using UV absorption of filtered portions of the *Sample solution*, suitably diluted with *Medium*, if necessary, in comparison with the *Standard solution*.

Tolerances: NLT 70% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

For products labeled to contain 500 mg of metformin hydrochloride

Medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 50 rpm

Time: 30 min

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Tolerances: NLT 80% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

For products labeled to contain 850 or 1000 mg of metformin hydrochloride

Medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 2: 75 rpm

Time: 30 min

Standard solution, Sample solution, Instrumental conditions, and Analysis: Proceed as directed in *Test 1*.

Tolerances: NLT 75% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium: pH 6.8 phosphate buffer; 1000 mL

Apparatus 1: 100 rpm

Time: 60 min

Buffer: Dissolve 1.38 g of monobasic sodium phosphate in about 1800 mL of water. Add 3.484 g of 1-pentanesulfonic acid sodium salt. Adjust with diluted phosphoric acid to a pH of 3.00 ± 0.05 . Dilute with water to 2000 mL.

Mobile phase: Acetonitrile and *Buffer* (1:19)

Standard stock solution: 0.25 mg/mL of USP

Metformin Hydrochloride RS in *Medium*. Use sonication to dissolve.

Standard solution: 0.05 mg/mL of USP Metformin Hydrochloride RS in *Medium* from the *Standard stock solution*

Sample solution: Pass a portion of the solution under test through a nylon filter of 0.45- μm pore size. Dilute with *Medium*, if necessary, to obtain a solution with a concentration similar to that of the *Standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 230 nm

Column: 4.6-mm \times 25-cm; 5- μm packing L1

Flow rate: 1.0 mL/min

Injection volume: 40 μL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 2.0

Column efficiency: NLT 1500 theoretical plates

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times (V/D) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 1000 mL

D = dilution factor of the *Sample solution*

Tolerances: NLT 70% (Q) of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

Acceptance criteria

Any individual impurity: NMT 0.1%
 Total impurities: NMT 0.6%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
USP Metformin Hydrochloride RS

Metformin Hydrochloride Extended-Release Tablets

DEFINITION

Metformin Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$).

IDENTIFICATION

- **A.** The retention time of the major peak from the *Sample solution* corresponds to that from the *Standard solution*, as obtained in the *Assay*.

ASSAY**• PROCEDURE**

Buffer solution: 0.5 g/L of sodium 1-heptanesulfonate and 0.5 g/L of sodium chloride in water. Before final dilution, adjust with 0.06 M phosphoric acid to a pH of 3.85.

Mobile phase: Acetonitrile and *Buffer solution* (1:9).

[NOTE—To improve the separation, the composition of acetonitrile and *Buffer solution* may be changed to 1:19, if necessary.]

Diluent: 1.25% solution of acetonitrile in water

Standard solution: ($L/4000$) mg/mL of USP Metformin Hydrochloride RS in *Diluent*, where L is the labeled quantity, in mg, of metformin hydrochloride in each Tablet

System suitability stock solution: 12.5 µg/mL each of USP Metformin Related Compound B RS and USP Metformin Related Compound C RS in *Diluent*

System suitability solution: Dilute 0.5 mL of the *System suitability stock solution* with the *Standard solution* to 50 mL.

Sample stock solution: Finely powder NLT 10 Tablets. Transfer powder, equivalent to the average Tablet weight, to a homogenization vessel, and add 500 mL of a 10% acetonitrile solution. Alternately, homogenize and allow to soak until the sample is fully homogenized. [NOTE—A suggested homogenization sequence is as follows. Homogenize the sample using five pulses, each of 5 s, at about 20,000 rpm, and allow to soak for 2 min. Repeat these steps two additional times.]

Sample solution: Pass a portion of the *Sample stock solution* through a suitable filter of 0.45-µm pore size, discarding the first 3 mL of filtrate. Transfer 25 mL of

the filtrate to a 200-mL volumetric flask, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 218 nm

Column: 3.9-mm × 30-cm; 10-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 10 µL

Run time: Until after the elution locus of metformin related compound C

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for metformin related compound B, metformin, and metformin related compound C are 0.86, 1.0, and 2.1–2.3, respectively. Metformin related compound C can have a variable retention time. The composition of the *Mobile phase* may be changed to 1:19, if it elutes at a relative retention time of less than 2.1.]

Suitability requirements

Resolution: NLT 1.5 between the peaks due to metformin related compound B and metformin

Tailing factor: NLT 0.8 and NMT 2.0 for the metformin peak

Relative standard deviation: NMT 1.5% for the metformin peak and NMT 10% for each of the peaks due to metformin related compound B and metformin related compound C

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Metformin Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of metformin hydrochloride in the *Sample solution*

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS**Change to read:****• DISSOLUTION (711)****Test 1**

Medium: pH 6.8 phosphate buffer solution; 1000 mL

Apparatus 2: 100 rpm for Tablets labeled to contain 500 mg

Times: 1, 3, and 10 h

Detector: UV 232 nm

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable hydrophilic polyethylene filter of 0.45-µm pore size. Dilute, if necessary, with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) released at each time point:

$$\text{Result} = [(A_U/A_S) \times C_S \times (V - V_S) + (C_{60} \times V_S) + (C_{180} \times V_S)] \times (100/L)$$

A_U = absorbance of the *Sample solution*

- A_s = absorbance of the *Standard solution*
 C_s = concentration of the *Standard solution* (mg/mL)
 V = initial volume of *Medium* in the vessel (mL)
 V_s = volume withdrawn from the vessel for previous samplings (mL)
 C_{60} = concentration of metformin hydrochloride in *Medium* determined at 1 h (mg/mL)
 C_{180} = concentration of metformin hydrochloride in *Medium* determined at 3 h (mg/mL)
 L = label claim (mg/Tablet)
Tolerances: See Table 1.

Table 1

Time (h)	Amount Dissolved, 500-mg Tablet (%)	Amount Dissolved, 750-mg Tablet (%)
1	20–40	22–42
3	45–65	49–69
10	NLT 85	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Prepare as directed for *Test 1*; 1000 mL.

Apparatus 2: 100 rpm

Times: 1, 2, 6, and 10 h

Detector: UV 232 nm

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable polyethylene filter of 0.45- μ m pore size. Dilute, if necessary, with *Medium* to a concentration that is similar to that of the *Standard solution*.

Analysis: Calculate, in mg/mL, the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_u , in *Medium* at each time point, t :

$$\text{Result} = (A_u \times C_s \times D_u) / A_s$$

- A_u = absorbance of the *Sample solution*
 C_s = concentration of metformin hydrochloride in the *Standard solution* (mg/mL)
 D_u = dilution factor of the solution under test
 A_s = absorbance of the *Standard solution*

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point by the following formulas.

Percentage dissolved at the first time point (1 h):

$$\text{Result} = (C_1 \times V \times 100) / L$$

- C_1 = content of metformin hydrochloride in *Medium* at the first time interval (mg/mL)
 V = volume of *Medium*, 1000 mL
 L = label claim (mg/Tablet)

Percentage dissolved at the second time point (2 h):

$$\text{Result} = [C_2 \times (V - SV_1) + C_1 \times SV_1] \times (100/L)$$

- C_2 = content of metformin hydrochloride in *Medium* at the second time interval (mg/mL)
 V = volume of *Medium*, 1000 mL
 SV_1 = volume of the sample withdrawn at 1 h (mL)
 C_1 = content of metformin hydrochloride in *Medium* at 1 h (mg/mL)
 L = label claim (mg/Tablet)

Percentage dissolved at the n th time point:

$$\text{Result} = \{C_n \times [V - (n - 1)V_s] + (C_1 + C_2 + \dots + C_{n-1}) \times V_s\} \times (100/L)$$

- C_n = content of metformin hydrochloride in *Medium* at the n th time interval (mg/mL)
 V = volume of *Medium*, 1000 mL
 n = time interval of interest
 V_s = volume of sample withdrawn at each time interval (mL)
 C = as $C_1, C_2, C_3, \dots, C_{n-1}$, the content of metformin hydrochloride in *Medium* at each time interval (mg/mL)
 L = label claim (mg/Tablet)
Tolerances: See Table 2.

Table 2

Time (h)	Amount Dissolved (%)
1	20–40
2	35–55
6	65–85
10	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 3: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

Medium, Apparatus 1, and Apparatus 2 • (ERR 1–Jun-2016): Proceed as directed in *Test 1*.

Times: 1, 2, 5, and 12 h for Tablets labeled to contain 500 mg; and 1, 3, and 10 h for Tablets labeled to contain 750 mg

Detector: UV 232 nm

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable hydrophilic polyethylene filter of 0.45- μ m pore size. Dilute, if necessary, with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) released at each time point:

$$\text{Result} = \{[(A_u/A_s) \times C_s \times (V - V_s) + (C_{60} \times V_s) + (C_{120} \times V_s) + (C_{300} \times V_s) + (C_{720} \times V_s)] \times 100\} / L$$

- A_u = absorbance of the *Sample solution*
 A_s = absorbance of the *Standard solution*
 C_s = concentration of the *Standard solution* (mg/mL)
 V = initial volume of *Medium* in the vessel (mL)
 V_s = volume withdrawn from the vessel for previous samplings (mL)
 C_{60} = concentration of metformin hydrochloride in *Medium* determined at 1 h (mg/mL)
 C_{120} = concentration of metformin hydrochloride in *Medium* determined at 2 h (mg/mL)
 C_{300} = concentration of metformin hydrochloride in *Medium* determined at 5 h (mg/mL)
 C_{720} = concentration of metformin hydrochloride in *Medium* determined at 12 h (mg/mL)
 L = label claim (mg/Tablet)

Tolerances: See Tables 3 and 4.

Table 4. For Tablets Labeled to Contain 750 mg

Time (h)	Amount Dissolved (%)
1	22–42
3	49–69
10	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 4: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

Medium: Prepare as directed for *Test 1*; 1000 mL.

Apparatus 2: 100 rpm

Times: 1, 3, 6, and 10 h

Detector: UV 250 nm (shoulder)

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Dilute, if necessary, with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Calculate, in mg/mL, the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t , in *Medium* at each time point, t , by the formulas specified in *Test 2*.

Tolerances: See *Table 5*.

Table 5

Time (h)	Amount Dissolved (%)
1	20–40
3	45–65
6	65–85
10	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 5: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

Medium: pH 6.8 phosphate buffer solution; 900 mL, deaerated

Apparatus 1: 100 rpm, with the vertical holder described in *Figure 1* and *Figure 2*

Times: 2, 8, and 16 h

Detector: UV 250 nm

Standard solution: USP Metformin Hydrochloride RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size. Dilute, if necessary, with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Place a vertical sample holder into each basket (see *Figures 1* and *2*). Place 1 Tablet inside the sample holder, making sure that the Tablets are vertical at the bottom of the baskets.

Calculate, in mg/mL, the content of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$), C_t , in *Medium* at each time point, t , by the formulas specified in *Test 2*.

Tolerances: See *Table 6*.

Table 6

Time (h)	Amount Dissolved, 500-mg Tablet (%)	Amount Dissolved, 1000-mg Tablet (%)
2	NMT 30	NMT 30
8	60–85	65–90

Time (h)	Amount Dissolved (%)
1	20–40
5	45–65
12	70–90
20	NLT 85

Table 11. For Tablets Labeled to Contain 750 mg

Time (h)	Amount Dissolved (%)
1	20–45
4	45–70
10	70–95
24	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 10: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 10*.
Medium: 0.05 M phosphate buffer (prepared by dissolving 6.8 g of monobasic potassium phosphate in 250 mL of water, adding 77 mL of 0.2 N sodium hydroxide and 500 mL of water, adjusting with 2 N sodium hydroxide or 2 N hydrochloric acid to a pH 6.8, and diluting with water to 1000 mL)

Apparatus 1: 100 rpm for Tablets labeled to contain 750 mg

Apparatus 2: 100 rpm for Tablets labeled to contain 500 mg

Times: 1, 3, and 10 h

Standard solution: ($L/100,000$) mg/mL of USP Metformin Hydrochloride RS in *Medium*, where L is the label claim, in mg/Tablet. This solution is stable for 72 h at room temperature.

Sample solution: At the times specified, withdraw 10 mL of the solution under test and replace with 10 mL of *Medium* previously equilibrated at $37.0 \pm 0.5^\circ$. Centrifuge at 2500 rpm for 10 min. Dilute a portion of the supernatant with *Medium* to obtain a theoretical concentration of ($L/100,000$) mg/mL, where L is the label claim, in mg/Tablet.

Detector: UV 233 nm

Path length: 1 cm

Blank: *Medium*

Analysis: Calculate the concentration (mg/mL) of metformin hydrochloride (C) at each time point:

$$C_i = (A_U/A_S) \times C_S$$

- A_U = absorbance of the *Sample solution*
 A_S = absorbance of the *Standard solution*
 C_S = concentration of the *Standard solution* (mg/mL)

Calculate the cumulative percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved (Q_i) at each time point (i):

At $i = 1$:

$$Q_1 = (C_1 \times V/L) \times 100$$

At $i = 3$:

$$Q_3 = [C_3(V - V_3) + (C_1 \times V_3)] \times 100/L$$

At $i = 10$:

$$Q_{10} = [C_{10}(V - 2V_3) + (C_1 + C_3)V_3] \times 100/L$$

V = initial volume of *Medium*, 1000 mL

V_3 = sampling volume, 10 mL

L = label claim (mg/Tablet)

Tolerances: See Table 12.

Table 12

Time (h)	Amount Dissolved (%)
1	25–45
3	50–70
10	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 11: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 11*.

Medium: pH 6.8 phosphate buffer solution; 1000 mL

Apparatus 1: 100 rpm for Tablets labeled to contain 750 mg

Apparatus 2: 100 rpm for Tablets labeled to contain 500 mg

Times: 1, 3, and 10 h

Standard solution: 7.5 µg/mL of USP Metformin Hydrochloride RS in *Medium*

Sample solution: At the times specified, withdraw 10 mL of the solution under test, and pass it through a suitable filter of 0.45-µm pore size, discarding the first 3 mL of filtrate. Dilute 3.0 mL of the filtrate with *Medium* to 200 mL. For Tablets labeled to contain 750 mg, dilute 2.0 mL of the filtrate with *Medium* to 200 mL. Replace the volume of *Medium* taken with the same volume of *Medium* preheated at $37.0 \pm 0.5^\circ$.

Detector: UV 232 nm

Path length: 1 cm

Blank: *Medium*

Analysis: Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point:

$$Q_i = (A_u/A_s) \times (C_s/L) \times V \times D \times 100$$

At 1 h:

$$\text{Result} = Q_1$$

At 3 h:

$$\text{Result} = Q_3 + [(Q_1 \times 10)/V]$$

At 10 h:

$$\text{Result} = Q_{10} + [(Q_1 \times 10)/V] + [(Q_3 \times 10)/V]$$

A_u = absorbance of the *Sample solution*

A_s = absorbance of the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

L = label claim (mg/Tablet)

V = volume of *Medium*, 1000 mL

D = dilution factor of the *Sample solution*

Tolerances: See Table 13.

Table 13

Time (h)	Amount Dissolved (%)
1	25–45
3	50–70
10	NLT 80

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 12: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 12*.

Medium: pH 6.8 phosphate buffer solution; 1000 mL

Apparatus 1: 100 rpm

Times: 1, 4, and 12 h

Standard stock solution: 0.2 mg/mL of USP Metformin Hydrochloride RS in *Medium*

Standard solution: 0.01 mg/mL of USP Metformin Hydrochloride RS in water, from the *Standard stock solution*

Sample solution: At the times specified, withdraw 10 mL of the solution under test, and replace with 10 mL of *Medium* previously equilibrated at $37.0 \pm 0.5^\circ$. Pass it through a suitable filter, discarding the first few mL of the filtrate.

For Tablets labeled to contain 500 mg: Dilute 2.0 mL of the filtrate with water to 100 mL.

For Tablets labeled to contain 1000 mg: Dilute 1.0 mL of the filtrate with water to 100 mL.

Detector: UV 232 nm

Blank: Dilute 1 mL of *Medium* with water to 100 mL.

Analysis: Calculate the concentration, C_i , in mg/mL of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) in the sample withdrawn at each time point (i):

$$\text{Result}_i = (A_u/A_s) \times C_s \times D$$

A_u = absorbance of the *Sample solution*

A_s = absorbance of the *Standard solution*

C_s = concentration of the *Standard solution* (mg/mL)

D = dilution factor of the *Sample solution*

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved (Q_i) at each time point (i):

$$\text{Result}_1 = C_1 \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_3 \times V) + [(C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

C_i = concentration of metformin hydrochloride in the portion of sample withdrawn at time point i (mg/mL)

V = initial volume of *Medium*, 1000 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn, 10 mL

Tolerances: See Table 14.

Table 14

Time point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 15
2	4	35–65
3	12	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

Test 13: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 13*.
Medium: pH 6.8 phosphate buffer solution; 1000 mL
Apparatus 1: 100 rpm

Times: 1, 4, 6, and 14 h

Standard stock solution: 0.2 mg/mL of USP

Metformin Hydrochloride RS prepared as follows.

Transfer a suitable amount of USP Metformin Hydrochloride RS into an appropriate volumetric flask. Dissolve by adding *Medium* to fill 50% of the flask volume and dilute with *Medium* to volume.

Standard solution: 0.01 mg/mL of USP Metformin Hydrochloride RS from *Standard stock solution* in water

Sample stock solution: At the times specified, withdraw 10 mL of the solution under test, and replace with the same volume of *Medium* preheated at $37.0 \pm 0.5^\circ$. Pass a portion of the solution under test through a suitable filter of 0.45- μ m pore size, discard the first few mL, and use the filtrate.

Sample solution

For Tablets labeled to contain 500 mg: Dilute 2 mL of *Sample stock solution* with water to 100 mL.

For Tablets labeled to contain 1000 mg: Dilute 1 mL of *Sample stock solution* with water to 100 mL.

Instrumental conditions

(See *Ultraviolet-Visible Spectroscopy* (857).)

Mode: UV

Analytical wavelength: 232 nm

Blank

For Tablets labeled to contain 500 mg: Dilute 2 mL of *Medium* with water to 100 mL.

For Tablets labeled to contain 1000 mg: Dilute 1 mL of *Medium* with water to 100 mL.

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the concentration (C_i), in mg/mL, of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) in the sample withdrawn from the vessel at each time point (i):

$$\text{Result}_i = (A_U/A_S) \times C_S \times D$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of the *Standard solution* (mg/mL)

D = dilution factor of the *Sample solution*

Calculate the percentage of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at each time point (i):

$$\text{Result}_1 = C_i \times V \times (1/L) \times 100$$

$$\text{Result}_2 = [(C_2 \times V) + (C_1 \times V_3)] \times (1/L) \times 100$$

$$\text{Result}_3 = [(C_3 \times V) + [(C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

$$\text{Result}_4 = [(C_4 \times V) + [(C_3 + C_2 + C_1) \times V_3]] \times (1/L) \times 100$$

C_i = concentration of metformin hydrochloride in the portion of sample withdrawn at the specified time point (mg/mL)

V = volume of *Medium*, 1000 mL

L = label claim (mg/Tablet)

V_3 = volume of the *Sample solution* withdrawn at each time point and replaced with *Medium* (mL)

Tolerances: See *Table 15*.

Table 15

Time point (i)	Time (h)	Amount Dissolved (%)
1	1	NMT 20
2	4	45–65
3	6	65–85
4	14	NLT 85

The percentages of the labeled amount of metformin hydrochloride ($C_4H_{11}N_5 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

IMPURITIES

• ORGANIC IMPURITIES

Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the *Assay*.

Analysis: From the chromatogram of the *Sample solution* obtained in the *Assay*, calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity

r_T = sum of all the peak responses

Acceptance criteria

Individual impurities: NMT 0.1%

Total impurities: NMT 0.6%

[NOTE—Disregard any peak less than 0.05%, and disregard any peak observed in the blank.]

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers, and store at controlled room temperature.
- **LABELING:** When more than one dissolution test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** (11)
 - USP Metformin Hydrochloride RS
 - USP Metformin Related Compound B RS
 - 1-Methylbiguanide hydrochloride.
 - $C_3H_9N_5HCl$ 151.60
 - USP Metformin Related Compound C RS
 - N,N*-Dimethyl-[1,3,5]triazine-2,4,6-triamine.
 - $C_5H_{10}N_6$ 154.17

Methacholine Chloride

$C_8H_{18}ClNO_2$ 195.69
1-Propanaminium, 2-(acetyloxy)-N,N,N-trimethyl-, chloride, (±)-;
(±)-(2-Hydroxypropyl)trimethylammonium chloride acetate [62-51-1].

DEFINITION

Methacholine Chloride contains NLT 98.0% and NMT 101.0% of methacholine chloride ($C_8H_{18}ClNO_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191)
Sample solution: 20 mg/mL
Acceptance criteria: Meets the requirements
- **C.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

PROCEDURE

Mobile phase: 0.5 g/L of methanesulfonic acid in water
Standard solution: 50 µg/mL of USP Methacholine Chloride RS in water

System suitability solution: 10 µg/mL of USP Acetylcholine Chloride RS in *Standard solution*

Sample solution: 50 µg/mL of Methacholine Chloride in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: IC

Detector: Conductivity

Columns

Guard: 4.0-mm x 50-mm; L77¹ packing

Analytical: 4.0-mm x 25-cm; L77¹ packing

Suppressor: Ion-exchange membrane autosuppressor² or a suitable chemical suppression system

Suppressant: Autosuppression

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 2 between acetylcholine and methacholine, *System suitability solution*

Relative standard deviation: NMT 1.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methacholine chloride ($C_8H_{18}ClNO_2$) in the portion of Methacholine Chloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methacholine Chloride RS in the *Standard solution* (µg/mL)

C_U = concentration of Methacholine Chloride in the *Sample solution* (µg/mL)

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 20 ppm (Official 1-

Jan-2018)

ORGANIC IMPURITIES

Mobile phase: 0.5 g/L of methanesulfonic acid in water
System suitability solution: 1 mg/mL of USP

Methacholine Chloride RS and 1 µg/mL of USP Acetylcholine Chloride RS in water

Standard solution: 1 µg/mL of USP Methacholine Chloride RS in water

Sample solution: 1 mg/mL of Methacholine Chloride in water

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: IC

Detector: Conductivity

Columns

Guard: 4.0-mm x 50-mm; L77¹ packing

Analytical: 4.0-mm x 25-cm; L77¹ packing

Suppressor: Ion-exchange membrane autosuppressor¹ or a suitable chemical suppression system

Suppressant: Autosuppression

Flow rate: 1 mL/min

Injection volume: 20 µL

Run time: Two times the retention time of methacholine

System suitability

Sample: *System suitability solution*

[NOTE—See *Table 1* for the relative retention times.]

Suitability requirements

Resolution: NLT 2 between acetylcholine and methacholine

Signal-to-noise ratio: NLT 2 for acetylcholine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of beta-methylcholine or acetylcholine in the portion of Methacholine Chloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of beta-methylcholine or acetylcholine from the *Sample solution*

r_S = peak response of methacholine chloride from the *Standard solution*

C_S = concentration of USP Methacholine Chloride RS in the *Standard solution* (µg/mL)

C_U = concentration of Methacholine Chloride in the *Sample solution* (µg/mL)

Acceptance criteria: See *Table 1*.

¹ Available as IonPac CS17.

² Available as Cation Self-Regenerating Suppressor (CSRS) from Dionex Inc., or equivalent.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Beta-methylcholine ^a	0.6	0.10
Acetylcholine	0.8	0.10
Methacholine	1.0	—

^a 2-Hydroxy-N,N,N-trimethylpropan-1-aminium chloride.

SPECIFIC TESTS• **LOSS ON DRYING** (731)

Analysis: Dry a sample at 105° for 4 h.

Acceptance criteria: NMT 1.5%

ADDITIONAL REQUIREMENTS• **PACKAGING AND STORAGE:** Preserve in tight containers.• **USP REFERENCE STANDARDS** (11)

USP Acetylcholine Chloride RS

USP Methacholine Chloride RS

Methacycline Hydrochloride

$C_{22}H_{22}N_2O_8 \cdot HCl$ 478.88

2-Naphthacenecarboxamide, 4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-, monohydrochloride, [4S-(4 α , 4a α , 5 α , 5a α , 12a α)]-

4-(Dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,5,10,12,12a-pentahydroxy-6-methylene-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [3963-95-9].

» Methacycline Hydrochloride has a potency equivalent to not less than 832 μ g and not more than 970 μ g of methacycline ($C_{22}H_{22}N_2O_8$) per mg.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Doxycycline Hyclate RS

USP Methacycline Hydrochloride RS

Identification, Ultraviolet Absorption (197U)—

Solution: 20 μ g per mL.

Medium: hydrochloric acid in methanol (1 in 1200).

Absorptivity at 345 nm, calculated on the dried basis, is between 88.4% and 96.4% of the USP Methacycline Hydrochloride RS, the potency of the Reference Standard being taken into account.

Crystallinity (695): meets the requirements.

pH (791): between 2.0 and 3.0, in a solution containing 10 mg of methacycline per mL.

Water Determination, Method I (921): not more than 2.0%.

Assay—

Mobile phase—Prepare a mixture of 0.2 M ammonium oxalate, dimethylformamide, and 0.1 M edetate disodium (11:5:4), adjust with tetrabutylammonium hydroxide, 40 percent in water, to a pH of 7.0, and filter. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

System suitability preparation—Prepare a solution of USP Methacycline Hydrochloride RS and USP Doxycycline Hyclate RS in *Mobile phase* containing about 0.5 mg of each per mL.

Standard preparation—Quantitatively dissolve an accurately weighed quantity of USP Methacycline Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.5 mg per mL.

Assay preparation—Transfer about 50 mg of Methacycline Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 354-nm detector and a 4.6-mm \times 15-cm column that contains 3.5- μ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.75 for methacycline and 1.0 for doxycycline; and the resolution, *R*, between methacycline and doxycycline is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in μ g, of methacycline ($C_{22}H_{22}N_2O_8$) in each mg of Methacycline Hydrochloride taken by the formula:

$$100(CE/W)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Methacycline Hydrochloride RS in the *Standard preparation*; *E* is the methacycline content, in μ g per mg, of USP Methacycline Hydrochloride RS; *W* is the quantity, in mg, of Methacycline Hydrochloride taken to prepare the *Assay preparation*; and *r_U* and *r_S* are the methacycline peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methacycline Hydrochloride Capsules

» Methacycline Hydrochloride Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of methacycline ($C_{22}H_{22}N_2O_8$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Doxycycline Hyclate RS

USP Methacycline Hydrochloride RS

Identification—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing the equivalent of about 1 mg of methacycline per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification—Tetracyclines* (193).

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 60 minutes.

Procedure—Determine the amount of $C_{22}H_{22}N_2O_8 \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 345 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a Standard solution having a known concentra-

tion of USP Methacycline Hydrochloride RS in the same *Medium*.

Tolerances—Not less than 70% (Q) of the labeled amount of $C_{22}H_{22}N_2O_8 \cdot HCl$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements.

Water Determination, Method I (921): not more than 7.5%.

Assay—

Mobile phase, System suitability preparation, and Chromatographic system—Proceed as directed in the Assay under Methacycline Hydrochloride.

Standard preparation—Transfer about 28 mg of USP Methacycline Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of water, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Place no fewer than 5 Capsules in a high-speed, glass blender jar containing an accurately measured volume of water, and blend for 3 to 5 minutes to obtain a stock solution having a concentration of about 2.5 mg of methacycline ($C_{22}H_{22}N_2O_8$) per mL. Filter, transfer 10.0 mL of the filtrate to a 50-mL volumetric flask, add 10 mL of water, dilute with *Mobile phase* to volume, and mix.

Procedure—Proceed as directed in the Assay under Methacycline Hydrochloride. Calculate the quantity, in mg, of methacycline ($C_{22}H_{22}N_2O_8$) in each Capsule taken by the formula:

$$5(CE / 1000)(V / N)(r_U / r_S)$$

in which *V* is the volume, in mL, of water used to prepare the stock solution for the Assay preparation; *N* is the number of Capsules taken to prepare the stock solution for the Assay preparation; and the other terms are as defined therein.

Methacycline Hydrochloride Oral Suspension

» Methacycline Hydrochloride Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of methacycline ($C_{22}H_{22}N_2O_8$). It contains one or more suitable and harmless buffers, colors, diluents, dispersants, flavors, and preservatives.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Doxycycline Hyclate RS

USP Methacycline Hydrochloride RS

Identification—To an accurately measured volume of Oral Suspension, equivalent to about 50 mg of methacycline, add 50 mL of methanol, shake, and allow the mixture to settle. Using the clear supernatant as the *Test Solution*, proceed as directed for *Method II* under Identification—Tetracyclines (193).

Uniformity of dosage units (905)—

FOR SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698): meets the requirements.

pH (791): between 6.5 and 8.0.

Assay—

Mobile phase, System suitability preparation, and Chromatographic system—Proceed as directed in the Assay under Methacycline Hydrochloride.

Standard preparation—Transfer about 28 mg of USP Methacycline Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 10 mL of water, dilute with *Mobile phase* to volume, and mix.

Assay preparation—Transfer an accurately measured quantity of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 50 mg of methacycline ($C_{22}H_{22}N_2O_8$), to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter.

Procedure—Proceed as directed in the Assay under Methacycline Hydrochloride. Calculate the quantity, in mg, of methacycline ($C_{22}H_{22}N_2O_8$) in each mL of the Oral Suspension taken by the formula:

$$100(CE / 1000V)(r_U / r_S)$$

in which *V* is the volume, in mL, of Oral Suspension taken to prepare the Assay preparation; and the other terms are as defined therein.

Methadone Hydrochloride

$C_{21}H_{27}NO \cdot HCl$

345.91

3-Heptanone, 6-(dimethylamino)-4,4-diphenyl-, hydrochloride;

6-(Dimethylamino)-4,4-diphenyl-3-heptanone hydrochloride [1095-90-5].

DEFINITION

Methadone Hydrochloride contains NLT 98.5% and NMT 100.5% of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): A solution meets the requirements of the tests.

ASSAY

• PROCEDURE

Sample: 500 mg

Mode: Direct titration

Titrimetric system

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Visual

Analysis: Dissolve the *Sample* in a mixture of 10 mL of glacial acetic acid and 10 mL of mercuric acetate TS, warming slightly if necessary to dissolve. Cool the solution to room temperature, add 10 mL of dioxane, then add crystal violet TS, and titrate rapidly with *Titrant*. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of *Titrant* is equivalent to 34.59 mg of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

Acceptance criteria: 98.5%–100.5% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **ORDINARY IMPURITIES** (466)
 - Standard solution: Alcohol
 - Sample solution: Alcohol
 - Eluant: Methanol and ammonium hydroxide (100:1.5)
 - Visualization: 3
 - Acceptance criteria: The sum of the intensities of all secondary spots from the *Sample solution* corresponds to NMT 1.0%.

SPECIFIC TESTS

- **PH** (791)
 - Sample solution: 10 mg/mL
 - Acceptance criteria: 4.5–6.5
- **LOSS ON DRYING** (731)
 - Sample: 500 mg
 - Analysis: Dry the *Sample* at 105° for 1 h.
 - Acceptance criteria: NMT 0.3%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)
 - USP Methadone Hydrochloride RS

Methadone Hydrochloride Oral Concentrate

DEFINITION

Methadone Hydrochloride Oral Concentrate contains, in each mL, NLT 9.0 mg and NMT 11.0 mg of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$). It contains a suitable preservative and may contain suitable coloring, flavoring, and surface-active agents.

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)
 - Sample solution: A volume of Oral Concentrate equivalent to 5 mg of methadone hydrochloride
 - Chromatographic system
 - Developing solvent system: Alcohol, glacial acetic acid, and water (5:3:2)
 - Analysis: Shake the *Sample solution* with 5 mL of sodium carbonate TS, and extract with 5 mL of chloroform. Proceed as directed, using iodoplatinate TS to visualize the spots.
 - Acceptance criteria: Meets the requirements
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirements

ASSAY

- **PROCEDURE**
 - Mobile phase: Acetonitrile and 0.033 M monobasic potassium phosphate (40:60). Adjust with phosphoric acid to a pH of 4.0, filter, and degas.
 - Standard solution: 0.4 mg/mL of USP Methadone Hydrochloride RS in *Mobile phase*
 - Sample stock solution: Nominally 1 mg/mL of methadone hydrochloride from Oral Concentrate in *Mobile phase*
 - Sample solution: 0.4 mg/mL of methadone hydrochloride in *Mobile phase* from *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)
 Mode: LC
 Detector: UV 254 nm
 Column: 3.9-mm × 30-cm; packing L11
 Flow rate: 2 mL/min
 Injection volume: 10 μ L
 System suitability
 Sample: *Standard solution*
 Suitability requirements
 Column efficiency: NLT 1500 theoretical plates
 Tailing factor: NMT 2.0
 Relative standard deviation: NMT 2.0% for replicate injections

Analysis

Samples: *Standard solution* and *Sample solution*
 Calculate the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) in the portion of Oral Concentrate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times L$$

r_U = peak response from the *Sample solution*
 r_S = peak response from the *Standard solution*
 C_S = concentration of USP Methadone Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of the *Sample solution* (mg/mL)
 L = label claim (mg/mL)
 Acceptance criteria: 9.0–11.0 mg/mL

SPECIFIC TESTS

- **PH** (791): 1.0–6.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and store at controlled room temperature.
- **LABELING:** Label it to indicate that it is to be diluted with water or other liquid to 30 mL or more before administration.
- **USP REFERENCE STANDARDS** (11)
 - USP Methadone Hydrochloride RS

Methadone Hydrochloride Injection

DEFINITION

Methadone Hydrochloride Injection is a sterile solution of Methadone Hydrochloride in Water for Injection. It contains, in each mL, NLT 9.5 mg and NMT 10.5 mg of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

IDENTIFICATION

- **A. IDENTIFICATION—ORGANIC NITROGENOUS BASES** (181): Meets the requirements

ASSAY

- **PROCEDURE**
 - Internal standard solution: 5 mg/mL of procaine in methylene chloride
 - Standard solution: Transfer 10 mg of USP Methadone Hydrochloride RS to a 60-mL separator. Add 1 mL of water and 2 mL of 0.5 N sodium hydroxide, and extract with three 10-mL portions of methylene chloride, combining the extracts in a vessel containing about 3 g of anhydrous sodium sulfate. Transfer 2.0 mL of *Internal standard solution* to the vessel containing the extracts, insert the stopper, and mix. Decant 15 mL of the methylene chloride solution to a test tube, and evaporate to a volume of 2–3 mL using vacuum or a stream of nitrogen.

Sample solution: Transfer 1.0 mL of Injection, equivalent to 10 mg of methadone hydrochloride, to a 60-mL separator. Add 2 mL of 0.5 N sodium hydroxide, and extract with three 10-mL portions of methylene chloride, combining the extracts in a vessel containing about 3 g of anhydrous sodium sulfate. Transfer 2.0 mL of *Internal standard solution* to the vessel containing the extracts, insert the stopper, and mix. Decant 15 mL of the methylene chloride solution to a test tube, and evaporate to a volume of 2–3 mL using vacuum or a stream of nitrogen.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: Glass column, 1.2-m long and 4-mm in diameter; packed with 3% phase G2 on 100- to 200-mesh support S1A

Temperatures

Column: 170°

Injection port: 225°

Detector: 240°

Carrier gas: Dry helium

Flow rate: 55 mL/min

Injection volume: Containing 5 µg of methadone

System suitability

Sample: *Standard solution* (six replicate injections)

Suitability requirements

Resolution: NLT 5.0 between methadone and procaine

Coefficient of variation: NMT 1% in the ratios of the peak areas of methadone to the peak area of procaine

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the quantity, in mg, of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) in each mL of Injection taken:

$$\text{Result} = (R_U/R_S) \times W \times 100$$

R_U = peak area ratio of methadone to procaine from the *Sample solution*

R_S = peak area ratio of methadone to procaine from the *Standard solution*

W = weight, in mg, of USP Methadone Hydrochloride RS in the *Standard solution*

Acceptance criteria: 9.5–10.5 mg/mL

SPECIFIC TESTS

• **pH (791):** 3.0–6.5

• **BACTERIAL ENDOTOXINS TEST (85):** NMT 8.8 USP Endotoxin Units/mg of methadone hydrochloride

• **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose, light-resistant containers, preferably of Type I glass.

• **USP REFERENCE STANDARDS (11)**

USP Endotoxin RS

USP Methadone Hydrochloride RS

Methadone Hydrochloride Oral Solution

DEFINITION

Methadone Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

IDENTIFICATION

• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)

Sample solution: A volume of Oral Solution equivalent to 5 mg of methadone hydrochloride

Developing solvent system: Alcohol, glacial acetic acid, and water (5:3:2)

Analysis: Shake the *Sample solution* with 5 mL of sodium carbonate TS, and extract with 5 mL of chloroform. Proceed as directed using iodoplatinate TS to visualize the spots.

Acceptance criteria: Meets the requirements

• B. IDENTIFICATION TESTS—GENERAL, Chloride (191):

Meets the requirements

ASSAY

• PROCEDURE

Mobile phase: Acetonitrile and 0.033 M monobasic potassium phosphate (40:60). Adjust dropwise with phosphoric acid to a pH of 4.0.

Internal standard solution: 250 µg/mL of pyrilamine maleate

Standard solution: Transfer 20 mg of USP Methadone Hydrochloride RS to a 25-mL volumetric flask. Add 2.0 mL of *Internal standard solution*, and dilute with water to volume.

Sample solution: Transfer a volume of Oral Solution equivalent to 20 mg of methadone hydrochloride to a 125-mL separator. Extract the specimen with two 50-mL portions of ether, collecting the ether extracts in a second separator. Wash the combined ether extracts with 2 mL of water, and discard the ether extract. Transfer the aqueous wash and the aqueous specimen to a 25-mL volumetric flask. Add 2.0 mL of *Internal standard solution*, and dilute with water to volume. Pass the solution through a filter of 5-µm pore size.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 3.9-mm × 30-cm; packing L11

Flow rate: 1.3 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

The retention times for the internal standard and methadone hydrochloride are about 5.5 and 9 min, respectively.

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) in the Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

R_U = peak response ratio of methadone hydrochloride to the internal standard from the *Sample solution*

R_S = peak response ratio of methadone hydrochloride to the internal standard from the *Standard solution*

C_S = concentration of USP Methadone Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methadone hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

• **ALCOHOL DETERMINATION, Method II (611)** (if present): 90.0%–115.0% of the labeled amount of C_2H_5OH , deter-

mined by the gas chromatographic procedure using acetone as the internal standard

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for Oral Solution packaged in single-unit containers
- **DELIVERABLE VOLUME (698):** Meets the requirements for Oral Solution packaged in multiple-unit containers

SPECIFIC TESTS

- **PH (791):** 1.0–4.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, and store at controlled room temperature.
- **USP REFERENCE STANDARDS (11)**
USP Methadone Hydrochloride RS

Methadone Hydrochloride Tablets

DEFINITION

Methadone Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
Sample: Equivalent to 5 mg of methadone hydrochloride from a quantity of finely powdered Tablets
Chromatographic system
Developing solvent system: Alcohol, glacial acetic acid, and water (5:3:2)
Analysis: Shake the *Sample* with 5 mL of sodium carbonate TS, and extract with 5 mL of chloroform. Proceed as directed using iodoplatinate TS to visualize the spots.
Acceptance criteria: Meet the requirements

ASSAY

- **PROCEDURE**
Mobile phase: Acetonitrile and 0.03 M monobasic potassium phosphate (40:60). Adjust with phosphoric acid to a pH of 3.2.
Standard solution: 0.4 mg/mL of USP Methadone Hydrochloride RS in *Mobile phase*
Sample solution: 0.4 mg/mL of methadone hydrochloride in *Mobile phase*. Prepare by transferring an amount of finely powdered Tablets (NLT 20) equivalent to 10 mg of methadone hydrochloride to a 25-mL volumetric flask, add 10 mL of *Mobile phase*, and sonicate briefly. Shake by mechanical means for 15 min, dilute with *Mobile phase* to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

- Mode:** LC
- Detector:** UV 254 nm
- Column:** 3.9-mm \times 30-cm; packing L11
- Flow rate:** 1.5 mL/min
- Injection volume:** 10 μ L
- System suitability**
Sample: *Standard solution*
Suitability requirements
Tailing factor: NMT 2.0
Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
- r_S = peak response from the *Standard solution*
- C_S = concentration of USP Methadone Hydrochloride RS in the *Standard solution* (mg/mL)
- C_U = nominal concentration of methadone hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

- **DISSOLUTION (711)**
Medium: Water; 500 mL
Apparatus 1: 100 rpm
Time: 45 min
Standard solution: USP Methadone Hydrochloride RS in *Medium*
Sample solution: *Sample* per *Dissolution* (711).
Instrumental conditions
Mode: Vis
Analytical wavelength: Maximum at about 405 nm
Analysis: Filter a portion of the *Sample solution*, and pipet a volume of the filtrate equivalent to about 400 μ g of methadone hydrochloride into a suitable separator. Add 1 mL of glacial acetic acid and 20 mL of a solution of bromocresol purple prepared by dissolving 200 mg of bromocresol purple in 1000 mL of dilute glacial acetic acid (1 in 50). Mix, and extract with 20.0 mL of chloroform.
Determine the amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) dissolved from visible absorbances at the wavelength of maximum absorbance of the chloroform extract so obtained in comparison with the chloroform extract similarly prepared from the *Standard solution*.
Tolerances: NLT 75% (Q) of the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** (11)
USP Methadone Hydrochloride RS

Methadone Hydrochloride Tablets for Oral Suspension

DEFINITION

Methadone Hydrochloride Tablets for Oral Suspension contain NLT 93.0% and NMT 107.0% of the labeled amount of methadone hydrochloride ($C_{21}H_{27}NO \cdot HCl$).

IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

Sample solution: Shake a quantity of powdered Tablets for Oral Suspension equivalent to 5 mg of methadone hydrochloride with 5 mL of sodium carbonate TS, and extract with 5 mL of chloroform.

Developing solvent system: Alcohol, glacial acetic acid, and water (5:3:2)

Analysis: Proceed as directed, using iodoplatinate TS to visualize the spots.

Acceptance criteria: Meet the requirements

ASSAY

- **PROCEDURE**

Mobile phase: Acetonitrile and 0.03 M monobasic potassium phosphate (40:60). Adjust with phosphoric acid to a pH of 3.2.

Standard solution: 0.4 mg/mL of USP Methadone Hydrochloride RS in *Mobile phase*

Sample solution: 0.4 mg/mL of methadone hydrochloride in *Mobile phase*. Prepare by transferring an amount of finely powdered Tablets for Oral Suspension (NLT 20) equivalent to 10 mg of methadone hydrochloride to a 25-mL volumetric flask, adding 10 mL of *Mobile phase*, and sonicating briefly. Shake by mechanical means for 15 min, dilute with *Mobile phase* to volume, and filter.

- **USP REFERENCE STANDARDS** (11)
 USP Methamphetamine Hydrochloride RS

Methamphetamine Hydrochloride Tablets

DEFINITION

Methamphetamine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$).

IDENTIFICATION

- **A.** The UV absorption spectrum of the *Sample solution*, prepared as described in *Procedure for content uniformity* in *Uniformity of Dosage Units*, exhibits maxima and minima at the same wavelengths as those of the *Standard solution*, concomitantly measured.

ASSAY

• PROCEDURE

Mobile phase: Prepare a degassed solution of 1.1 g of sodium 1-heptanesulfonate in a mixture of water, methanol, and diluted glacial acetic acid (7 in 50) (575:400:25). Adjust with acetic acid to a pH of 3.3 ± 0.1 , if necessary. Filter through a 0.5- μ m disk.

Standard solution: 0.2 mg/mL of USP Methamphetamine Hydrochloride RS in 0.12 M phosphoric acid. Sonicate if necessary.

Sample solution: Transfer a portion of fine powder from NLT 20 Tablets, nominally equivalent to about 10 mg of methamphetamine hydrochloride, to a 50-mL volumetric flask. Add 20 mL of 0.12 M phosphoric acid, and sonicate for 5 min. Dilute with 0.12 M phosphoric acid to volume, and filter.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 257 nm

Column: 3.9-mm \times 30.0-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1000 theoretical plates

Tailing factor: NMT 1.5

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Methamphetamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_u = nominal concentration of methamphetamine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Mobile phase: Acetonitrile and dilute perchloric acid (1 in 20) (300:700). Filter, and degas.

Sample solution: Filter aliquots of the solution in the test, and dilute 2:1 with 0.15 M perchloric acid.

Standard solution: Dissolve USP Methamphetamine Hydrochloride RS in water to obtain a concentration similar to the one expected in the *Sample solution*. Dilute 2:1 with 0.15 M perchloric acid.

Chromatographic system

Mode: LC

Detector: UV 211 nm

Column: 3.9-mm \times 30-cm; packing L1

Flow rate: 2.5 mL/min

Injection volume: 100 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.5

Relative standard deviation: NMT 3.0%

Analysis

Samples: *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$) dissolved by comparing the major peak response of the *Sample solution* with that of the *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905)

Procedure for content uniformity

Solution A: Shake 250 mL of 0.1 N sulfuric acid with 25 mL of chloroform for 10 min. Allow to stand for 1 h with occasional shaking. Drain off the chloroform, and retain the chloroform-saturated sulfuric acid in a stoppered flask.

Standard solution: 0.5 mg/mL of USP

Methamphetamine Hydrochloride RS in *Solution A*

Sample solution: Place 1 Tablet in a 125-mL separator. Add 15 mL of water, and shake by mechani-

cal means for 15 min to dissolve. Add 2.5 mL of 1 N sodium hydroxide, and shake. Extract the liberated methamphetamine with four 10-mL portions of chloroform, collecting the chloroform extracts in a second 125-mL separator. Transfer 10.0 mL of *Solution A* to the second separator, and shake by mechanical means for 10 min. Allow the layers to separate, and collect the aqueous layer.

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum at about 257 nm

Cell: 1 cm

Blank: *Solution A*

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of methamphetamine hydrochloride ($C_{10}H_{15}N \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methamphetamine Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methamphetamine hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS (11)**

USP Methamphetamine Hydrochloride RS

Methazolamide

$C_5H_8N_4O_3S_2$ 236.27

Acetamide, N-[5-(aminosulfonyl)-3-methyl-1,3,4-thiadiazol-2(3H)-ylidene]-.

N-(4-methyl-2-sulfamoyl- Δ^2 -1,3,4-thiadiazolin-5-ylidene)-acetamide [554-57-4].

» Methazolamide contains not less than 98.0 percent and not more than 102.0 percent of $C_5H_8N_4O_3S_2$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Methazolamide RS

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 10 μ g per mL.

Medium: sodium hydroxide solution in water (1 in 250).

Loss on drying (731)—Dry it at 105° for 2 hours; it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Selenium (291): 0.003%, a 200-mg specimen being used.

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. (Official 1-Jan-2018)

Assay—

Buffer solution—Dissolve 1.80 g of anhydrous sodium acetate in 1 L of water. Adjust, if necessary, with glacial acetic acid to a pH of 4.5 ± 0.2 .

Mobile phase—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (86:14). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve about 20 mg of USP Methazolamide RS, accurately weighed, in 20 mL of acetonitrile contained in a 200-mL volumetric flask. Dilute with *Buffer solution* to volume, and mix. Quantitatively dilute an accurately measured volume of this solution with *Buffer solution* to obtain a solution having a known concentration of about 50 μ g of USP Methazolamide RS per mL.

Resolution solution—Prepare a solution of acetaminophen and USP Methazolamide RS in acetonitrile containing 0.3 mg of acetaminophen and 0.5 mg of methazolamide per mL. Quantitatively dilute an accurately measured volume of this solution with *Buffer solution* to obtain a solution containing 30 μ g of acetaminophen and 50 μ g of methazolamide per mL.

Assay preparation—Transfer about 100 mg of Methazolamide, accurately weighed, to a 200-mL volumetric flask, dissolve in 20 mL of acetonitrile, dilute with *Buffer solution* to volume, and mix. Quantitatively dilute an accurately measured volume of this solution with *Buffer solution* to obtain a solution having a known concentration of about 50 μ g per mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 3.9-mm \times 15.0-cm column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for acetaminophen and 1.0 for methazolamide, the resolution, R , between the acetaminophen peak and the methazolamide peak is not less than 4.0, and the tailing factor is not more than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the responses for the major peaks. Calculate the quantity, in mg, of $C_5H_8N_4O_3S_2$ in the portion of Methazolamide taken by the formula:

$$2C(r_U/r_S)$$

in which C is the concentration, in μ g per mL, of USP Methazolamide RS in the *Standard preparation*; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methazolamide Tablets

» Methazolamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of

the labeled amount of methazolamide ($C_5H_8N_4O_3S_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Methazolamide RS

Identification—

A: Extract a quantity of finely powdered Tablets, equivalent to about 250 mg of methazolamide, with about 50 mL of acetone. Filter, and add solvent hexane until a heavy white precipitate is formed. Collect the solid on a filter, and dry: the IR absorption spectrum of a potassium bromide dispersion of the methazolamide so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Methazolamide RS.

B: Dissolve about 100 mg of the dried solid obtained in Identification test A in 5 mL of 1 N sodium hydroxide, and add 5 mL of a mixture of 1 g of hydroxylamine hydrochloride and 500 mg of cupric sulfate in 100 mL of water. Heat the solution on a steam bath for 15 minutes: the solution turns dark amber, then a black precipitate is formed.

C: The retention time of the major peak in the chromatogram of the Assay preparation corresponds to the chromatogram of the Standard preparation, as obtained in the Assay.

Dissolution (711)—

Medium: pH 4.5 acetate buffer, prepared by mixing 2.99 g of sodium acetate and 1.66 mL of glacial acetic acid with water to obtain 1000 mL of a solution having a pH of 4.5; 900 mL.

Apparatus 2: 75 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_5H_8N_4O_3S_2$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 252 nm of filtered portions of the solution under test, suitably diluted with pH 4.5 acetate buffer, in comparison with a Standard solution having a known concentration of USP Methazolamide RS in the same Medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_5H_8N_4O_3S_2$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

pH 2.5 Buffer—Transfer 16.8 mL of dibutylamine to a beaker containing 70 mL of water. Adjust with phosphoric acid to a pH of 2.5, dilute with water to 100 mL, and mix.

Mobile phase—Prepare a mixture of water, methanol, and pH 2.5 Buffer (375:15:6). Make adjustments if necessary (see System Suitability under Chromatography (621)).

pH 4.5 Acetate buffer—Dissolve 2.99 g of sodium acetate and 1.66 mL of glacial acetic acid in water, dilute with water to 1000 mL, and mix. Adjust, if necessary, with glacial acetic acid or sodium hydroxide to a pH of 4.5.

Standard preparation—Dissolve an accurately weighed quantity of USP Methazolamide RS in methanol to obtain a solution having a concentration of about 0.5 mg per mL. Dilute this solution quantitatively, and stepwise if necessary, with pH 4.5 Acetate buffer to obtain a solution having a known concentration of about 50 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of methazolamide, to a 250-mL volumetric flask, add 65 mL of pH 4.5 Acetate buffer, and sonicate to dissolve. Add 65 mL of methanol, and sonicate again until dissolved. Dilute with pH 4.5 Acetate

buffer to volume, mix, and filter. Dilute an accurately measured volume of the filtrate with pH 4.5 Acetate buffer to obtain a solution having a concentration of about 50 µg of methazolamide per mL.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 252-nm detector and an 8-mm × 10-cm column that contains packing L10. The flow rate is about 2 mL per minute. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 3.0%.

Procedure—Separately inject equal volumes (about 25 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of methazolamide ($C_5H_8N_4O_3S_2$) in the portion of Tablets taken by the formula:

$$C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Methazolamide RS in the Standard preparation; and r_U and r_S are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

Methdilazine Hydrochloride

$C_{18}H_{20}N_2S \cdot HCl$ 332.89

10H-Phenothiazine, 10-[(1-methyl-3-pyrrolidiny)methyl]-, monohydrochloride.

10-[(1-Methyl-3-pyrrolidiny)methyl]phenothiazine monohydrochloride [1229-35-2].

» Methdilazine Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of $C_{18}H_{20}N_2S \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Methdilazine Hydrochloride RS

NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—

A: Infrared Absorption (197K).

B: Ultraviolet Absorption (197U)—

Solution: 5 µg per mL.

Medium: water.

C: A solution of it responds to the tests for Chloride (191).

Melting range, Class I (741): between 184° and 190°.

pH (791): between 4.8 and 6.0, in a solution (1 in 100).

Loss on drying (731)—Dry it in vacuum at 65° for 16 hours: it loses not more than 1.0% of its weight.

Residue on ignition (281): not more than 0.5%.

Selenium (291)—The absorbance of the solution from the Test Solution, prepared with 100 mg of Methdilazine Hydrochloride and 100 mg of magnesium oxide, is not greater than one-half that from the Standard Solution (0.003%).

Delete the following:

• **Heavy metals, Method II (231):** 0.002%. (Official 1-Jan-2016)

Ordinary impurities (466)—

Test solution: methanol.

Standard solution: methanol.

Application volume: 10 μ L.

Eluant: a mixture of toluene, isopropyl alcohol, and ammonium hydroxide (70:29:1), in a nonequilibrated chamber.

Visualization: 5.

Assay—Transfer about 100 mg of Methdilazine Hydrochloride, accurately weighed, to a 1000-mL volumetric flask, add water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Methdilazine Hydrochloride RS in the same medium having a known concentration of about 5 μ g per mL, in 1-cm cells at 252 and 275 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $C_{18}H_{20}N_2S \cdot HCl$ in the portion of Methdilazine Hydrochloride taken by the formula:

$$20C(A_{252} - A_{275})_U / (A_{252} - A_{275})_S$$

in which C is the concentration, in μ g per mL, of USP Methdilazine Hydrochloride RS in the Standard solution; and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution of Methdilazine Hydrochloride (U) and the Standard solution (S), respectively.

Methdilazine Hydrochloride Oral Solution

» Methdilazine Hydrochloride Oral Solution contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of methdilazine hydrochloride ($C_{18}H_{20}N_2S \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Methdilazine Hydrochloride RS

NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Transfer a volume of Oral Solution, equivalent to about 4 mg of methdilazine hydrochloride, to a 60-mL separator, add 5 mL of 0.1 N hydrochloric acid, and extract with 10 mL of ether, discarding the extract. Add 10 mL of sodium bicarbonate solution (1 in 10) to the separator, and extract with 3 mL of chloroform. Filter the extract through a pledget of cotton. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask: the IR absorption spectrum of a potassium bromide dispersion of the methdilazine so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Methdilazine Hydrochloride RS that has been treated in the same manner.

pH (791): between 3.3 and 4.1.

Alcohol Determination, Method II (611): between 6.5% and 7.5% of C_2H_5OH .

Assay—

Standard preparation—Dissolve a suitable quantity of USP Methdilazine Hydrochloride, accurately weighed, in chloroform, and quantitatively dilute with chloroform to obtain a solution having a known concentration of about 400 μ g per mL.

Assay preparation—Transfer a volume of Oral Solution, equivalent to about 4 mg of methdilazine hydrochloride, to a 60-mL separator, add 10 mL of a saturated solution of sodium chloride, and extract with three 10-mL portions of chloroform, transferring the extracts to a 100-mL volumetric flask.

Procedure—Transfer 10.0 mL of Standard preparation to a 100-mL volumetric flask, and add 20 mL of chloroform. To this flask and to the flask containing the Assay preparation add 4.0 mL of buffered palladium chloride TS, dilute with alcohol to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 460 nm, with a suitable spectrophotometer, using a mixture of 30 mL of chloroform, 4 mL of palladium chloride TS, and 66 mL of alcohol as the blank. Calculate the quantity, in mg, of methdilazine hydrochloride ($C_{18}H_{20}N_2S \cdot HCl$) in each mL of the Oral Solution taken by the formula:

$$(0.01C / V)(A_U / A_S)$$

in which C is the concentration, in μ g per mL, of USP Methdilazine Hydrochloride RS in the Standard preparation; V is the volume, in mL, of Oral Solution taken; and A_U and A_S are the absorbances of the solutions from the Assay preparation and the Standard preparation, respectively.

Methdilazine Hydrochloride Tablets

» Methdilazine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of methdilazine hydrochloride ($C_{18}H_{20}N_2S \cdot HCl$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Methdilazine Hydrochloride RS

NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them, by conducting the procedures without delay, under subdued light, or using low-actinic glassware.

Identification—Transfer a portion of finely powdered Tablets, equivalent to about 8 mg of methdilazine hydrochloride, to a 60-mL separator, add 10 mL of sodium bicarbonate solution (1 in 10), and extract with 3 mL of chloroform. Filter the extract through a pledget of cotton. Evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask: the IR absorption spectrum of a potassium bromide dispersion of the methdilazine so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Methdilazine Hydrochloride RS, similarly treated and measured.

Dissolution (711)—

Medium: water; 900 mL.

Apparatus 1: 100 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{18}H_{20}N_2S \cdot HCl$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 252 nm of filtered portions of the solution under test, suitably diluted with Dissolution Medium, if necessary, in comparison with a Standard solution having a

known concentration of USP Methdilazine Hydrochloride RS in the same Medium.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_{18}H_{20}N_2S \cdot HCl$ is dissolved in 45 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Standard preparation—Dissolve a suitable quantity of USP Methdilazine Hydrochloride RS, accurately weighed, in chloroform, and dilute quantitatively with chloroform to obtain a solution having a known concentration of about 400 µg per mL.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets, and transfer an accurately weighed portion of the powder, equivalent to about 80 mg of methdilazine hydrochloride, to a 200-mL volumetric flask. Add 60 mL of chloroform, shake for 20 minutes, dilute with chloroform to volume, and mix. Filter, discarding the first 15 mL of the filtrate. Use the subsequent filtrate as directed in the Procedure.

Procedure—Into three separate 100-mL volumetric flasks transfer 10.0 mL each of the *Standard preparation*, the *Assay preparation*, and chloroform to provide the blank. To each flask add 20 mL of chloroform and 4.0 mL of buffered palladium chloride TS, dilute with alcohol to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 460 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of methdilazine hydrochloride ($C_{18}H_{20}N_2S \cdot HCl$) in the portion of Tablets taken by the formula:

$$0.2C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Methdilazine Hydrochloride RS in the *Standard preparation*; and A_U and A_S are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

Methenamine

$C_6H_{12}N_4$ 140.19
1,3,5,7-Tetraazatricyclo[3.3.1.1^{3,7}]decane;
Hexamethylenetetramine [100-97-0].

DEFINITION

Methenamine, dried over phosphorus pentoxide for 4 h, contains NLT 99.0% and NMT 100.5% of methenamine ($C_6H_{12}N_4$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

• B.

Analysis: Heat a solution (1 in 10) with 2 N sulfuric acid.

Acceptance criteria: Formaldehyde is liberated, recognizable by its odor and by its darkening of paper moistened with silver ammonium nitrate TS. On the subsequent addition of an excess of 1 N sodium hydroxide to the solution, ammonia is evolved.

ASSAY

• PROCEDURE

Chromotropic acid spot test solution: Suspend 100 mg of chromotropic acid in 2 mL of water, and

cautiously add 3 mL of sulfuric acid. Allow to cool, and add 25 mL of sulfuric acid. If excessive heat generated during mixing causes a violet color to appear in the solution, discard the solution and prepare another, taking precautions to avoid excessive heat.

Sample solution: Transfer 1 g of Methenamine, previously dried, to a beaker. Add 40.0 mL of 1 N sulfuric acid VS, and heat to a gentle boil, adding water from time to time if necessary, until the formaldehyde has been expelled. Test for the absence of formaldehyde by adding a drop of the assay solution to a glass fiber filter disk, on a watch glass, on which has previously been placed 3 or 4 drops of *Chromotropic acid spot test solution*. Formaldehyde produces a violet color with this reagent. Repeat the test until no violet color is obtained on the warmed test filter disk upon comparison with a blank filter disk to which no assay specimen is added. Cool, add 20 mL of water, then add methyl red TS.

Titrimetric system

Mode: Residual titration

Titrant: 1 N sulfuric acid VS

Back-titrant: 1 N sodium hydroxide VS

Endpoint detection: Visual

Analysis: Titrate the excess acid in the *Sample solution* with 1 N sodium hydroxide VS. Perform a blank determination (see *Titrimetry* (541), *Residual Titrations*). Each mL of 1 N sulfuric acid is equivalent to 35.05 mg of methenamine ($C_6H_{12}N_4$).

Acceptance criteria: 99.0%–100.5%

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.1%

• CHLORIDE AND SULFATE, Chloride (221)

Sample: 1.0 g

Acceptance criteria: 0.014%; shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid.

• SULFATE

Sample solution: 20 mg/mL

Analysis: 10 mL of the *Sample solution*, acidified with 5 drops of hydrochloric acid. Add 5 drops of barium chloride TS.

Acceptance criteria: No turbidity is produced within 1 min.

Delete the following:

• HEAVY METALS, Method I (231)

Test preparation: 2 g in 10 mL of water

Analysis: Add 2 mL of 3 N hydrochloric acid, and dilute with water to 25 mL. Proceed as directed, except use glacial acetic acid to adjust the pH.

Acceptance criteria: NMT 10 ppm • (Official 1-Jan-2018)

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry over phosphorus pentoxide for 4 h.

Acceptance criteria: NMT 2.0%

• AMMONIUM SALTS

Sample solution: 50 mg/mL

Analysis: Add to 10 mL of the *Sample solution* 1 mL of alkaline mercuric-potassium iodide TS.

Acceptance criteria: The mixture is not darker in color than a mixture of 1 mL of the reagent and 10 mL of water.

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

- **USP REFERENCE STANDARDS (11)**
USP Methenamine RS

Methenamine Oral Solution

DEFINITION

Methenamine Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of methenamine ($C_6H_{12}N_4$).

IDENTIFICATION

- **A.**
Sample solution: Heat a volume of Oral Solution, equivalent to 1 g of methenamine, with 10 mL of 2 N sulfuric acid.
Acceptance criteria: Formaldehyde is liberated, recognizable by its odor and by its darkening of paper moistened with silver ammonium nitrate TS. On the subsequent addition of an excess of 1 N sodium hydroxide to the solution, ammonia is evolved.

ASSAY

• PROCEDURE

Chromotropic acid solution: Mix 100 mg of chromotropic acid with 50 mL of water in a 100-mL volumetric flask. Cool in an ice bath and, while cooling, cautiously and slowly add 50 mL of sulfuric acid. Allow the solution to reach room temperature, and add dilute sulfuric acid (1 in 2) to volume. If excessive heat generated during mixing causes a violet color to appear in the solution, discard the solution and prepare another, taking precautions to avoid excessive heat.

Standard stock solution: 0.05 mg/mL of USP Methenamine RS

Standard solution: 1 µg/mL of USP Methenamine RS prepared as follows. Transfer 2.0 mL of *Standard stock solution* to a 100-mL volumetric flask, then add 25 mL of *Chromotropic acid solution* and 50 mL of dilute sulfuric acid (1 in 2). Place the flask in a boiling water bath for 30 min, accurately timed, then remove it from the bath. Cool immediately to room temperature, then add dilute sulfuric acid (1 in 2) to volume.

Standard blank: Transfer 2.0 mL of *Standard stock solution* to a 100-mL volumetric flask, then add 75 mL of dilute sulfuric acid (1 in 2). Place the flask in a boiling water bath for 30 min, accurately timed, then remove it from the bath. Cool immediately to room temperature, then add dilute sulfuric acid (1 in 2) to volume.

Sample stock solution: Nominally 60 µg/mL of methenamine from Oral Solution

Sample solution: Nominally 1.2 µg/mL of methenamine prepared as follows. Transfer 2.0-mL of *Sample stock solution* to a 100-mL volumetric flask, then add 25 mL of *Chromotropic acid solution* and 50 mL of dilute sulfuric acid (1 in 2). Place the flask in a boiling water bath for 30 min, accurately timed, then remove it from the bath. Cool immediately to room temperature, then add dilute sulfuric acid (1 in 2) to volume.

Sample blank: Transfer 2.0 mL of *Sample stock solution* to a 100-mL volumetric flask, then 75 mL of dilute sulfuric acid (1 in 2). Place the flask in a boiling water bath for 30 min, accurately timed, then remove it from the bath. Cool immediately to room temperature, and add dilute sulfuric acid (1 in 2) to volume.

Instrumental conditions

Mode: Vis

Analytical wavelength: Maxima at about 570 nm

Cell: 1 cm

Blank: Dilute sulfuric acid (1 in 2)

Analysis

Samples: *Standard solution*, *Standard blank*, *Sample solution*, *Sample blank*, and *Blank*

Calculate the percentage of the labeled amount of methenamine ($C_6H_{12}N_4$) in each mL of Oral Solution taken:

$$\text{Result} = [(A_U - B_U)/(A_S - B_S)] \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

B_U = absorbance of the *Sample blank*

A_S = absorbance of the *Standard solution*

B_S = absorbance of the *Standard blank*

C_S = concentration of USP Methenamine RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of methenamine in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

OTHER COMPONENTS

Methenamine Mandelate

$C_6H_{12}N_4 \cdot C_8H_8O_3$ 292.33
Benzenecetic acid, α -hydroxy-, (\pm)-, compd. with 1,3,5,7-tetraazatricyclo[3.3.1.1^{3,7}]decane (1:1);
Hexamethylenetetramine mono-(\pm)-mandelate [587-23-5].

DEFINITION

Methenamine Mandelate contains NLT 95.5% and NMT 102.0% of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$), and contains NLT 50.0% and NMT 53.0% of mandelic acid ($C_8H_8O_3$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

ASSAY• **PROCEDURE**

Sample solution: Transfer 60 mg of Methenamine Mandelate to a 250-mL conical flask. Add 15 mL of dehydrated alcohol, stir to dissolve, and add 40 mL of chloroform.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N silver nitrate in dehydrated alcohol prepared as follows. Dissolve by stirring 8.5 g of silver nitrate in 1000 mL of dehydrated alcohol. Transfer 100 mg of sodium chloride, previously dried at 110° for 2 h, to a 100-mL beaker, and dissolve in 50 mL of water. Titrate with the silver nitrate solution to the potentiometric endpoint, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Calculate the normality of the titrant.

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titrant*, determining the endpoint potentiometrically, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 7.308 mg of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

Acceptance criteria: 95.5%–102.0% on the dried basis

OTHER COMPONENTS

• CONTENT OF MANDELIC ACID

Sample solution: Transfer 90 mg to a 250-mL conical flask containing 50 mL of water. When the solution is complete, titrate the magnetically stirred solution.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N ceric ammonium nitrate VS

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titrant*, determining the endpoint potentiometrically. Each mL of 0.05 N ceric ammonium nitrate is equivalent to 3.804 mg of mandelic acid ($C_8H_8O_3$).

Acceptance criteria: 50.0%–53.0% on the dried basis

IMPURITIES

• RESIDUE ON IGNITION (281): NMT 0.1%

• CHLORIDE AND SULFATE, Chloride (221)

Sample: 1.0 g

Analysis: Dissolve the *Sample* in 10 mL of water, and add gradually 500 mg of anhydrous sodium carbonate. Evaporate to dryness, and ignite the residue at a dull-red heat. Add 20 mL of 2 N nitric acid, stir gently, and filter.

Acceptance criteria: 0.01%; the filtrate shows no more chloride than corresponds to 0.15 mL of 0.020 N hydrochloric acid.

• SULFATE

Sample: 0.20 g

Analysis: Dissolve the *Sample* in 10 mL of water. Add 5 drops of 3 N hydrochloric acid and 5 drops of barium chloride TS.

Acceptance criteria: No turbidity appears within 1 min.

USP Methenamine Mandelate RS

Methenamine Mandelate for Oral Solution

DEFINITION

Methenamine Mandelate for Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197)

Sample: A finely powdered portion, equivalent to 100 mg of methenamine mandelate

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelenths as

that of a potassium bromide dispersion of USP Methenamine Mandelate RS.

ASSAY

• PROCEDURE

Sample solution: Accurately weigh the contents of NLT 10 containers of Methenamine Mandelate for Oral Solution, and reduce to a fine powder. Transfer an equivalent to 60 mg of methenamine mandelate from the powder to a 150-mL beaker. Add 15 mL of dehydrated alcohol, stir to dissolve, and add 40 mL of chloroform.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N silver nitrate in dehydrated alcohol prepared as follows. Dissolve by stirring 8.5 g of silver nitrate in 1000 mL of dehydrated alcohol. Transfer 100 mg of sodium chloride, previously dried at 110° for 2 h, to a 100-mL beaker, and dissolve in 50 mL of water. Titrate with the silver nitrate solution to the potentiometric endpoint, using a silver billet indicator electrode and a silver–silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Calculate the normality of the titrant.

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titrant*, determining the endpoint potentiometrically, using a silver billet indicator electrode and a silver–silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 7.308 mg of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• UNIFORMITY OF DOSAGE UNITS (905): Meets the requirements for powder packaged in single-unit containers

• DELIVERABLE VOLUME (698): Meets the requirements for powder packaged in multiple-unit containers

SPECIFIC TESTS

• pH (791)

Sample solution: 1 g in 30 mL of water

Acceptance criteria: 4.0–4.5

• WATER DETERMINATION, Method I (921): NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in well-closed containers.

• LABELING: Label Methenamine Mandelate for Oral Solution that contains insoluble ingredients to indicate that the aqueous constituted Oral Solution contains dissolved methenamine mandelate but may remain turbid because of the presence of added substances.

• USP REFERENCE STANDARDS (11)

USP Methenamine Mandelate RS

Methenamine Mandelate Oral Suspension

DEFINITION

Methenamine Mandelate Oral Suspension is Methenamine Mandelate suspended in vegetable oil. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197)

Sample solution: Triturate the equivalent to 100 mg of methenamine mandelate, with 10 mL of chloroform, and pass through a 0.45- μ m pore size membrane filter.

Analysis: Evaporate the solvent in the *Sample solution*, wash the residue with five small portions of ether, and allow it to air-dry.

Acceptance criteria: The IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelenths as that of a potassium bromide dispersion of USP Methenamine Mandelate RS.

ASSAY

• PROCEDURE

Sample solution: Shake the Oral Suspension, then pipet, using a "to contain" pipet, an amount equivalent to 1 g of methenamine mandelate, into a 100-mL volumetric flask. Add 5.0 mL of dehydrated alcohol, mix, and add methylene chloride to volume. Pipet 5 mL of this solution into a 250-mL conical flask. Add 15 mL of dehydrated alcohol, and add 40 mL of chloroform.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N silver nitrate in dehydrated alcohol prepared as follows. Dissolve by stirring 8.5 g of silver nitrate in 1000 mL of dehydrated alcohol. Transfer 100 mg of sodium chloride, previously dried at 110° for 2 h, to a 100-mL beaker, and dissolve in 50 mL of water. Titrate with the silver nitrate solution to the potentiometric endpoint, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Calculate the normality of the titrant.

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titrant*, determining the endpoint potentiometrically, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 7.308 mg of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

- **UNIFORMITY OF DOSAGE UNITS (905):** Meets the requirements for Oral Suspension packaged in single-unit containers
- **DELIVERABLE VOLUME (698):** Meets the requirements for Oral Suspension packaged in multiple-unit containers

SPECIFIC TESTS

- **WATER DETERMINATION, Method I (921):** NMT 0.1%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
USP Methenamine Mandelate RS

Methenamine Mandelate Tablets

DEFINITION

Methenamine Mandelate Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197)**

Sample: Triturate a portion of finely powdered Tablets, equivalent to 5.0 mg of methenamine mandelate, with 5 mL of chloroform, and pass through a 0.45- μ m membrane filter. Evaporate the solvent, and allow the residue to air-dry.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Sample solution: Transfer an equivalent to 60 mg of methenamine mandelate, from NLT 20 finely powdered Tablets, to a 250-mL conical flask. Add 15 mL of dehydrated alcohol, stir to dissolve, and add 40 mL of chloroform.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N silver nitrate in dehydrated alcohol prepared as follows. Dissolve by stirring 8.5 g of silver nitrate in 1000 mL of dehydrated alcohol. Transfer 100 mg of sodium chloride, previously dried at 110° for 2 h, to a 100-mL beaker, and dissolve in 50 mL of water. Titrate with the silver nitrate solution to the potentiometric endpoint, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Calculate the normality of the titrant.

Endpoint detection: Potentiometric

Analysis: Titrate the *Sample solution* with *Titrant*, determining the endpoint potentiometrically, using a silver billet indicator electrode and a silver-silver chloride double-junction reference electrode containing a potassium nitrate salt bridge. Each mL of 0.05 N silver nitrate is equivalent to 7.308 mg of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

For uncoated or plain coated Tablets

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Standard solution: USP Methenamine Mandelate RS in *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: UV maximum at about 257 nm

Analysis: Determine the amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$) dissolved in the portion of the solution under test, passed through a filter of 0.45- μ m pore size and suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Methenamine Mandelate RS in the same *Medium*.

Tolerances: NLT 75% (Q) of the labeled amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Methenamine Mandelate RS

Methenamine Mandelate Delayed-Release Tablets

DEFINITION

Methenamine Mandelate Delayed-Release Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of methenamine mandelate ($C_6H_{12}N_4 \cdot C_8H_8O_3$).

IDENTIFICATION• **A. INFRARED ABSORPTION (197K)**

Sample: Triturate an equivalent to 5.0 mg of methenamine mandelate from finely powdered Tablets with 5 mL of chloroform, and pass through a filter of 0.45- μ m pore size. Evaporate the solvent, and allow the residue to air-dry.

Acceptance criteria: Meet the requirements

ASSAY• **PROCEDURE**

Sample solution: Transfer an equivalent to 60 mg of methenamine mandelate, from finely powdered Tablets (NLT 20), to a 250-mL conical flask. Add 15 mL of dehydrated alcohol, stir to dissolve, and add 40 mL of chloroform.

Titrimetric system

Mode: Direct titration

Titrant: 0.05 N silver nitrate in dehydrated alcohol prepared as follows. Dissolve by stirring 8.5 g of silver nitrate in 1000 mL of dehydrated alcohol. Transfer 100 mg of sodium chloride, previously dried at 110° for 2 h, to a 100-mL beaker, and dissolve in 50 mL of water. Methimazole

$C_4H_6N_2S$

114.17

2H-Imidazole-2-thione, 1,3-dihydro-1-methyl-; 1-Methylimidazole-2-thiol [60-56-0].

DEFINITION

Methimazole contains NLT 98.0% and NMT 101.0% of methimazole ($C_4H_6N_2S$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION (197K)****ASSAY**• **PROCEDURE**

Sample: 250 mg of Methimazole

Analysis: Dissolve the *Sample* in 75 mL of water. Add 15.0 mL of 0.1 N sodium hydroxide VS, mix, and add,

with stirring, 30 mL of 0.1 N silver nitrate. Continue the titration with the 0.1 N sodium hydroxide VS, determining the end-point potentiometrically. Each mL of 0.1 N sodium hydroxide is equivalent to 11.42 mg of methimazole ($C_4H_6N_2S$).

Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION (281):** NMT 0.1%• **SELENIUM (291)**

Sample: 200 mg of Methimazole

Acceptance criteria: NMT 30 ppm

• **ORGANIC IMPURITIES**

Standard solution: 0.01 mg/mL each of USP

Methimazole RS, USP Methimazole Related Compound A RS, 1-methylimidazole, and USP Methimazole Related Compound C RS in chloroform

Sample solution: 10 mg/mL of Methimazole in chloroform

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Flame ionization

Column: 30-m \times 0.25-mm; 0.5- μ m coating of G27

Temperatures

Injection port: 150°

Detector: 250°

Column: See *Table 1*.

Table 1

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
100	—	100	2
100	30	250	15

Carrier gas: Helium

Flow rate: 1.5 mL/min

Injection volume: 1 μ L

Injection type: Split ratio, 3:20

System suitability

Sample: *Standard solution*

Suitability requirements

Resolution: NLT 1.5 between methimazole related compound A and 1-methylimidazole

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methimazole related compound A, 1-methylimidazole, and methimazole related compound C in the portion of Methimazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each related compound from the *Sample solution*

r_S = peak response of the corresponding related compound from the *Standard solution*

C_S = concentration of the corresponding related compound in the *Standard solution* (mg/mL)

C_U = concentration of Methimazole in the *Sample solution* (mg/mL)

Calculate the percentage of any other individual impurity in the portion of Methimazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of each impurity from the *Sample solution*

r_S = peak response of methimazole from the *Standard solution*

C_S = concentration of USP Methimazole RS in the *Standard solution* (mg/mL)

C_U = concentration of Methimazole in the *Sample solution* (mg/mL)

Acceptance criteria: See Table 2. Disregard any peak below 0.02%.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Methimazole related compound A	0.3	0.1
1-Methylimidazole	0.4	0.1
Methimazole related compound C	0.7	0.1
Methimazole	1.0	—
Any other individual impurity	—	0.1
Total impurities	—	0.5

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry at 105° for 2 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Methimazole RS

USP Methimazole Related Compound A RS

2,2-Dimethoxy-*N*-methylethanamine.

$C_5H_{13}NO_2$ 119.16

USP Methimazole Related Compound C RS

1-Methyl-2-(methylthio)-1*H*-imidazole.

$C_5H_8N_2S$ 128.20

Methimazole Tablets

DEFINITION

Methimazole Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of methimazole ($C_4H_6N_2S$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: Digest a quantity of powdered Tablets, equivalent to 10 mg of methimazole, with 10 mL of warm chloroform for 20 min, filter, and evaporate the filtrate on a steam bath to dryness.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Sample solution: Finely powder NLT 20 Tablets. Transfer a portion of the powder, equivalent to 120 mg of methimazole, to a 100-mL volumetric flask. Add about 80 mL of water, insert the stopper, and shake by mechanical means or occasionally by hand for 30 min. Dilute with water to volume, and filter.

Analysis: Add 3.5 mL of 0.1 N sodium hydroxide VS to 50.0 mL of *Sample solution*, mix, and add, with stirring, 7 mL of 0.1 N silver nitrate. Continue the titration with the 0.1 N sodium hydroxide VS, determining the end-point potentiometrically. Each mL of 0.1 N sodium hydroxide is equivalent to 11.42 mg of methimazole ($C_4H_6N_2S$).

Acceptance criteria: 94.0%–106.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Medium: Water; 500 mL

Apparatus 1: 100 rpm

Time: 30 min

Standard solution: USP Methimazole RS at a known concentration in *Medium*

Sample solutions: Filtered solution under test, suitably diluted with *Medium*

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 252 nm

Tolerances: NLT 80% (Q) of the labeled amount of methimazole ($C_4H_6N_2S$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

Procedure for content uniformity

Standard solution: 5 µg/mL of USP Methimazole RS in water

Sample stock solution: Place 1 Tablet, previously crushed or finely powdered, in a 100-mL volumetric flask. Add 50 mL of water, and shake by mechanical means for 30 min. Dilute with water to volume, mix, and filter, discarding the first 20 mL of filtrate.

Sample solution: Nominally 5 µg/mL of methimazole in water from *Sample stock solution*

Instrumental conditions

Mode: UV

Analytical wavelength: Maximum absorbance at about 252 nm

Cell: 1 cm

Blank: Water

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Calculate the percentage of the labeled amount of methimazole ($C_4H_6N_2S$) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methimazole RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of methimazole in the *Sample solution* (µg/mL)

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in well-closed, light-resistant containers.

• USP REFERENCE STANDARDS (11)

USP Methimazole RS

Methionine

$C_5H_{11}NO_2S$

L-Methionine [63-68-3].

149.21

DEFINITION

Methionine contains NLT 98.5% and NMT 101.5% of L-methionine ($C_5H_{11}NO_2S$), calculated on the dried basis.

IDENTIFICATION• **A. INFRARED ABSORPTION** (197K)**ASSAY**• **PROCEDURE**

Sample: 140 mg of Methionine

Blank: Mix 3 mL of formic acid and 50 mL of glacial acetic acid.

Titrimetric system

(See *Titrimetry* (541).)

Mode: Direct titration

Titrant: 0.1 N perchloric acid VS

Endpoint detection: Potentiometric

Analysis: Dissolve the *Sample* in 3 mL of formic acid and 50 mL of glacial acetic acid, and titrate with the *Titrant*.

Calculate the percentage of methionine ($C_5H_{11}NO_2S$) in the *Sample* taken:

$$\text{Result} = \left[\frac{(V_S - V_B) \times N \times F}{W} \right] \times 100$$

V_S = *Titrant* volume consumed by the *Sample* (mL)

V_B = *Titrant* volume consumed by the *Blank* (mL)

N = actual normality of the *Titrant* (mEq/mL)

F = equivalency factor, 149.2 mg/mEq

W = *Sample* weight (mg)

Acceptance criteria: 98.5%–101.5% on the dried basis

IMPURITIES• **RESIDUE ON IGNITION** (281): NMT 0.4%• **CHLORIDE AND SULFATE, Chloride** (221)

Standard solution: 0.50 mL of 0.020 N hydrochloric acid

Sample: 0.73 g of Methionine

Acceptance criteria: NMT 0.05%

• **CHLORIDE AND SULFATE, Sulfate** (221)

Standard solution: 0.10 mL of 0.020 N sulfuric acid

Sample: 0.33 g of Methionine

Acceptance criteria: NMT 0.03 %

Methocarbamol Injection**DEFINITION**

Methocarbamol Injection is a sterile solution of Methocarbamol in an aqueous solution of Polyethylene Glycol 300. It contains NLT 95.0% and NMT 105.0% of the labeled amount of methocarbamol ($C_{11}H_{15}NO_5$).

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Sample: Mix a volume with 40 mL of water equivalent to 500 mg of methocarbamol from Injection in a small separator. Extract with 10 mL of ethyl acetate, and dry the ethyl acetate layer over anhydrous sodium sulfate. Evaporate the ethyl acetate with the use of a water bath maintained at 40° under a stream of nitrogen to dryness.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

- **PROCEDURE**

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid or potassium hydroxide to a pH of 4.5.

Mobile phase: Methanol and *Buffer* (30:70)

Standard solution: 1 mg/mL of USP Methocarbamol RS in *Mobile phase*

Sample solution: Nominally 1 mg/mL of methocarbamol from a suitable volume of Injection containing NLT 100 mg of methocarbamol in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 274 nm

Column: 4.6-mm × 10.0-cm; 3-μm or 5-μm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methocarbamol ($C_{11}H_{15}NO_3$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methocarbamol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methocarbamol in the *Sample solution* (mg/mL)

Acceptance criteria: 95.0%–105.0%

IMPURITIES

• LIMIT OF ALDEHYDES

Diluent: Alcohol and water (20:80)

Solution A: 10 mg/mL of phenylhydrazine hydrochloride in *Diluent*

Solution B: 10 mg/mL of potassium ferricyanide in water

Solution C: 10 µg/mL of formaldehyde in water prepared as follows. Dissolve 1.37 g of formaldehyde solution in 1 L of water. Dilute 10 mL of the resulting solution with water to 500 mL.

Standard solution: Transfer 4 mL of *Solution C* to a 25-mL volumetric flask. Add 2.0 mL of filtered *Solution A*. Allow to stand for 10 min. Add 1 mL of *Solution B*, and allow to stand for 5 min. Add 4 mL of hydrochloric acid, and dilute with alcohol to volume.

Sample solution: Empty the contents of NLT 10 vials of Injection to a suitable container. Transfer 4.0 mL of the composite sample of Injection to a 25-mL volumetric flask. Add 2.0 mL of filtered *Solution A*, and allow to stand for 10 min. Add 1 mL of *Solution B*, and allow to stand for 5 min. Add 4 mL of hydrochloric acid, and dilute with alcohol to volume.

Blank: Transfer 4 mL of water to a 25-mL volumetric flask. Add 2.0 mL of filtered *Solution A*, and allow to stand for 10 min. Add 1 mL of *Solution B*, and allow to stand for 5 min. Add 4 mL of hydrochloric acid, and dilute with alcohol to volume.

Instrumental conditions

Mode: Vis

Analytical wavelength: 515 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*

Determine the absorbances of the *Samples*.

Acceptance criteria: The absorbance of the *Sample solution* is NMT the absorbance of the *Standard solution* (NMT 10 µg of formaldehyde in each mL of Injection).

Methocarbamol Tablets

DEFINITION

Methocarbamol Tablets contain NLT 95.0% and NMT 105.0% of the labeled amount of methocarbamol ($C_{11}H_{15}NO_3$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197K)

Sample: Mix a portion of finely powdered Tablets equivalent to 1 g of methocarbamol with 25 mL of water in a separator, and extract with 25 mL of chloroform. Filter the extract, and evaporate to dryness.

Acceptance criteria: Meet the requirements

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Buffer: 6.8 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid or sodium hydroxide to a pH of 4.5.

Mobile phase: Methanol and *Buffer* (30:70)

System suitability solution: 1.0 mg/mL of USP Methocarbamol RS and 0.005 mg/mL of USP Guaifenesin RS in *Mobile phase*

Standard solution: 0.1 mg/mL of USP Methocarbamol RS in *Mobile phase*

Sample stock solution: Nominally 1 mg/mL of methocarbamol solution prepared as follows. Transfer a portion of finely powdered Tablets (NLT 10) to a volumetric flask of suitable size. Add 60% of the volume of the flask with *Mobile phase*. Sonicate for 30 min with intermittent shaking. Dilute with *Mobile phase* to volume. Pass a portion of the solution through a suitable filter of 0.45-µm pore size.

Sample solution: Nominally 0.1 mg/mL of methocarbamol from the *Sample stock solution* in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 274 nm

Column: 4.6-mm × 15-cm; 3-µm packing L1

Column temperature: 30°

Flow rate: 0.8 mL/min

Injection volume: 20 µL

Run time: 1.5 times the retention time of methocarbamol

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 1* for relative retention times.]

Suitability requirements

Resolution: NLT 3.5 between methocarbamol and guaifenesin, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methocarbamol ($C_{11}H_{15}NO_3$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response of methocarbamol from the *Sample solution*
 r_S = peak response of methocarbamol from the *Standard solution*
 C_S = concentration of USP Methocarbamol RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of methocarbamol in the *Sample solution* (mg/mL)
 Acceptance criteria: 95.0%–105.0%

PERFORMANCE TESTS**• DISSOLUTION (711)**

Medium: Water; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Mobile phase, Chromatographic system, and System suitability: Proceed as directed in the Assay.

Standard solution: USP Methocarbamol RS in Medium

Sample solution: Filtered portion of the solution under test, diluted with Medium if necessary

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methocarbamol ($C_{11}H_{15}NO_3$) dissolved:

$$\text{Result} = (r_U/r_S) \times C_S \times V \times (1/L) \times 100$$

- r_U = peak response of methocarbamol from the *Sample solution*
 r_S = peak response of methocarbamol from the *Standard solution*
 C_S = concentration of USP Methocarbamol RS in the *Standard solution* (mg/mL)
 V = volume of Medium, 900 mL
 L = label claim for methocarbamol (mg/Tablet)
 Tolerances: NLT 75% (Q) of the labeled amount of methocarbamol ($C_{11}H_{15}NO_3$) is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

IMPURITIES

Change to read:

• ORGANIC IMPURITIES

Mobile phase, System suitability solution, and Chromatographic system: Proceed as directed in the Assay.

Standard solution: 0.005 mg/mL of USP Methocarbamol RS in *Mobile phase*

Sample solution: Use the *Sample stock solution* from the Assay.

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See Table 1 for relative retention times.]

Suitability requirements

Resolution: NLT 3.5 between methocarbamol and guaifenesin, *System suitability solution*

Tailing factor: NMT 2.0, *Standard solution*

Relative standard deviation: NMT 5.0%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of each degradation product in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- r_U = peak response of each degradation product from the *Sample solution*
 r_S = peak response of methocarbamol from the *Standard solution*
 C_S = concentration of USP Methocarbamol RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methocarbamol in the *Sample solution* (mg/mL)

F = relative response factor (see Table 1)

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Guaifenesin	0.84	1.2	0.15
Methocarbamol isomer ^a	0.90	1.0	0.05
Methocarbamol	1.0	—	—
Methocarbamol dioxolone ^b	1.3	1.0	0.05
Any individual unspecified degradation product	—	—	0.10
Total impurities	—	—	1.0

^a 1-Hydroxy-3-(2-methoxyphenoxy)propan-2-yl carbamate.

^b 4-[(2-Methoxyphenoxy)methyl]-1,3-dioxolan-2-one.

• (RB 1-Apr-2016)

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE: Preserve in tight containers. Store at controlled room temperature.

• USP REFERENCE STANDARDS (11)

USP Guaifenesin RS

USP Methocarbamol RS

Methohexital

$C_{14}H_{18}N_2O_3$ 262.30

2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 1-methyl-5-(1-methyl-2-pentenyl)-5-(2-propenyl)-, (±)-.

(±)-5-Allyl-1-methyl-5-(1-methyl-2-pentenyl)barbituric acid [151-83-7].

» Methohexital contains not less than 98.0 percent and not more than 101.0 percent of $C_{14}H_{18}N_2O_3$, calculated on the anhydrous basis.

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Methohexital RS

Identification, Infrared Absorption (197S)—

Solution: 1 in 100.

Medium: chloroform.

Melting range (741): between 92° and 96°, but the range between beginning and end of melting does not exceed 3°.

Water Determination, Method I (921): not more than 2.0%.

Chloride (221)—Dissolve 200 mg in a mixture of 75 mL of ether and 25 mL of water, agitate, and allow to separate: the water solution shows no more chloride than corresponds to 0.17 mL of 0.010 N hydrochloric acid (0.03%).

Delete the following:

• **Heavy metals, Method II (231):** 0.001%. • (Official 1-Jan-2018)

Ordinary impurities (466)—

Test solution: methanol.

Standard solution: methanol.

Eluent: a mixture of chloroform and acetone (7:3).

Visualization—Expose the plate to chlorine gas for 1 minute, and air-dry the plate at room temperature for 2 minutes. Prepare a solution of 0.5 g of potassium iodide in 50 mL of water, and prepare a solution of 1.5 g of soluble starch in 50 mL of hot water. Mix 10 mL of each solution with 4 mL of alcohol to obtain the *Detection reagent*.

[NOTE—The *Detection reagent* so obtained may be used for up to 3 or 4 days.] Spray the plate with the *Detection reagent*.

Assay—Dissolve about 100 mg of Methohexital, accurately weighed, in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a solution having a concentration of about 10 mg per mL. Dissolve an accurately weighed quantity of USP Methohexital RS in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a Standard solution having a known concentration of about 10 mg per mL. Concomitantly determine the absorbances of both solutions in 0.1-mm cells at the wavelength of maximum absorbance at about 5.93 μm , with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of $\text{C}_{14}\text{H}_{18}\text{N}_2\text{O}_3$ in the portion of Methohexital taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Methohexital RS in the Standard solution; and A_U and A_S are the absorbances of the solution of Methohexital and the Standard solution, respectively.

Methohexital Sodium for Injection

$\text{C}_{14}\text{H}_{17}\text{N}_2\text{NaO}_3$ 284.29

2,4,6-(1*H*,3*H*,5*H*)-Pyrimidinetrione, 1-methyl-5-(1-methyl-2-pentynyl)-5-(2-propenyl)-, (\pm)-, monosodium salt. Sodium 5-allyl-1-methyl-5-(1-methyl-2-pentynyl)barbiturate [309-36-4; 22151-68-4].

» Methohexital Sodium for Injection is a freeze-dried, sterile mixture of methohexital sodium and anhydrous Sodium Carbonate as a buffer, prepared from an aqueous solution of Methohexital, Sodium Hydroxide, and Sodium Carbonate. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methohexital sodium ($\text{C}_{14}\text{H}_{17}\text{N}_2\text{NaO}_3$).

Packaging and storage—Preserve as described in *Packaging and Storage Requirements* (659), *Injection Packaging*. Store at controlled room temperature. Injection may be packaged in 50-mL multiple-dose containers.

USP Reference standards (11)—

USP Endotoxin RS

USP Methohexital RS

Completeness of solution—Mix 1 g with 20 mL of carbon dioxide-free water: after 1 minute, the solution is clear and free from undissolved solid.

Constituted solution—At the time of use, it meets the requirements for *Injections and Implanted Drug Products (Parenterals)*—*Product Quality Tests* (1), *Specific Tests, Completeness and clarity of solutions*.

Identification—

A: Dissolve about 500 mg in 10 mL of water in a separator, add 10 mL of 3 N hydrochloric acid, and extract the liberated methohexital with two 25-mL portions of chloroform. Evaporate the combined chloroform extracts to dryness, add 10 mL of ether, evaporate again, and dry the residue in vacuum at 80° for 4 hours. Dissolve 50 mg of the residue so obtained in 5 mL of chloroform: the solution exhibits IR absorption maxima at the same wavelengths as that of a similar preparation of USP Methohexital RS.

B: The methohexital obtained and dried as directed for *Identification test A* melts between 92° and 96°.

Bacterial Endotoxins Test (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of methohexital sodium.

Uniformity of dosage units (905): meets the requirements.

Procedure for content uniformity—

Standard solution—Transfer about 23 mg of USP Methohexital RS, accurately weighed, to a 250-mL volumetric flask, add 50 mL of water, 0.5 mL of sodium hydroxide solution (1 in 10), and 1.5 mL of sodium carbonate solution (1 in 1000), and mix. Dilute with water to volume, and mix. Transfer 20.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Test solution—Transfer the contents of 1 vial of Methohexital Sodium for Injection with the aid of water to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer an accurately measured volume of this solution, equivalent to about 100 mg of methohexital sodium, to a 1000-mL volumetric flask, add about 200 mL of water and 2.0 mL of sodium hydroxide solution (1 in 10), mix, dilute with water to volume, and again mix. Transfer 20.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

Procedure—Concomitantly determine the absorbances of the Standard solution and the Test solution in 1-cm cells at the wavelength of maximum absorbance at about 247 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of $\text{C}_{14}\text{H}_{17}\text{N}_2\text{NaO}_3$ in the Methohexital Sodium for Injection taken by the formula:

$$(284.29/262.30)(TC/D)(A_U / A_S)$$

in which 284.29 and 262.30 are the molecular weights of methohexital sodium and methohexital, respectively; T is the labeled quantity, in mg, of methohexital sodium in the Methohexital Sodium for Injection; C is the concentration, in μg per mL, of USP Methohexital RS in the Standard solution; D is the concentration, in μg per mL, of methohexital sodium in the Test solution based on the labeled quantity per container and the extent of dilution; and A_U and A_S are the absorbances of the Test solution and the Standard solution, respectively.

pH (791): between 10.6 and 11.6 in the solution prepared in the test for *Completeness of solution*.

Loss on drying (731)—Dry it at 105° for 4 hours: it loses not more than 2.0% of its weight.

Delete the following:

• **Heavy metals, Method II (231):** 0.001%. • (Official 1-Jan-2018)

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Internal standard solution—Dissolve aprobarbital in chloroform to obtain a solution having a concentration of about 1.35 mg per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Methohexital RS in chloroform to obtain a solution having a known concentration of about 0.46 mg

per mL. Transfer 5.0 mL of the resulting solution to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with chloroform to volume, and mix to obtain a *Standard preparation* having a known concentration of about 230 µg per mL.

Assay preparation—Combine and mix the constituted solutions prepared from the contents of 5 vials of Methohexital Sodium for Injection. Transfer an accurately measured volume of the resulting solution, equivalent to about 50 mg of methohexital sodium, to a 125-mL separator containing 25 mL of water, and mix. Add 0.2 mL of dilute hydrochloric acid (1 in 2), and mix. Extract with three 25-mL portions of chloroform, shaking each extraction for 2 minutes and filtering the extracts through about 15 g of anhydrous sodium sulfate, that previously has been washed with about 5 mL of chloroform, into a 100-mL volumetric flask. Wash the sodium sulfate with several small portions of chloroform, collecting the washings in the 100-mL volumetric flask. Dilute with chloroform to volume, and mix. Transfer 5.0 mL of this solution to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with chloroform to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and contains a 1.2-m × 4-mm column packed with 3% phase G10 on support S1AB. The column is maintained at about 230°, the injection port at about 265°, and the detector block at about 265°. Dry helium is used as the carrier gas at a flow rate of about 60 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between methohexital and aprobarbital is not less than 4.0, and the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 2 µL) of the *Assay preparation* and the *Standard preparation* into the gas chromatograph, and measure the peak responses for the major peak. The relative retention times are about 0.6 for methohexital and 1.0 for aprobarbital. Calculate the quantity, in mg, of methohexital sodium (C₁₄H₁₇N₃NaO₃) in the portion of Methohexital Sodium for Injection taken by the formula:

$$(284.29/262.30)(0.2C)(R_u / R_s)$$

in which 284.29 and 262.30 are the molecular weights of methohexital sodium and methohexital, respectively; *C* is the concentration, in µg per mL, of USP Methohexital RS in the *Standard preparation*; and *R_u* and *R_s* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methotrexate

C₂₀H₂₂N₈O₅

454.44

L-Glutamic acid, N-[4-[(2,4-diamino-6-pteridinyl)methyl]methylamino]benzoyl]-;

L-(+)-N-[p-[(2,4-Diamino-6-pteridinyl)methyl]methylamino]benzoyl] glutamic acid;

(S)-2-(4-[(2,4-Diaminopteridin-6-yl)methyl](methylamino)benzamido)pentanedioic acid [59-05-2].

DEFINITION

Methotrexate is a mixture of 4-amino-10-methylfolic acid and closely related compounds. It contains NLT 98.0% and NMT 102.0% of C₂₀H₂₂N₈O₅, calculated on the anhydrous basis.

[CAUTION]—Great care should be taken to prevent inhaling particles of Methotrexate and exposing the skin to it.]

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K): Do not dry specimens.
- **B. ULTRAVIOLET ABSORPTION** (197U)

Sample solution: 10 µg/mL in 0.1 N hydrochloric acid

ASSAY

• PROCEDURE

Buffer: 3.4 mg/mL of anhydrous monobasic sodium phosphate in water. Adjust with 1 N sodium hydroxide to a pH of 6.0.

Solution A: Acetonitrile and *Buffer* (1:19)

Solution B: Acetonitrile and *Buffer* (1:1)

Mobile phase: See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
30	50	50
34	50	50
35	100	0
40	100	0

Standard stock solution: 1.0 mg/mL of USP Methotrexate RS prepared as follows. Transfer a known amount of USP Methotrexate RS to a suitable volumetric flask, dissolve in dimethyl sulfoxide equivalent to 5% of the final volume, and dilute with *Solution A* to volume.

Standard solution: 0.2 mg/mL of USP Methotrexate RS in *Solution A*, from the *Standard stock solution*

Sample stock solution: Transfer 200 mg of Methotrexate to a 200-mL volumetric flask, and dissolve in 10 mL of dimethyl sulfoxide with sonication for 5 min. Add 150 mL of *Solution A*, and sonicate again for 5 min. Dilute with *Solution A* to volume to obtain 1.0 mg/mL of Methotrexate. [NOTE—Sonicate as needed.]

Sample solution: 0.2 mg/mL of Methotrexate in *Solution A*, from the *Sample stock solution*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection size: 20 µL

System suitability

Sample: *Standard solution*

Suitability requirements

Tailing factor: NMT 1.6

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of C₂₀H₂₂N₈O₅ in the portion of Methotrexate taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times 100$$

r_u = peak response from the *Sample solution*

r_s = peak response from the *Standard solution*

C_s = concentration of USP Methotrexate RS in the *Standard solution* (mg/mL)

C_u = concentration of Methotrexate in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the anhydrous basis

IMPURITIES**Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, *Method II* (231): NMT 20 ppm (Official 1-Jan-2018)

Organic Impurities• **PROCEDURE 1: RELATED COMPOUNDS**

Solution A, Solution B, Mobile phase, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

Standard stock solution A: Use the *Standard solution* from the Assay.

Standard solution A: 0.1 µg/mL of USP Methotrexate RS in *Solution A*, from *Standard stock solution A*

Standard stock solution B: Transfer known quantities of USP Methotrexate Related Compound C RS, USP Methotrexate Related Compound B RS, and USP Methotrexate Related Compound E RS to a suitable volumetric flask, dissolve in dimethyl sulfoxide equivalent to 1% of the final volume, and dilute with *Solution A* to volume to obtain 0.1 mg/mL of USP Methotrexate Related Compound B RS, 0.2 mg/mL of USP Methotrexate Related Compound C RS, and 0.1 mg/mL of USP Methotrexate Related Compound E RS.

Standard solution B: 0.4 µg/mL of USP Methotrexate Related Compound C RS, 0.2 µg/mL of USP Methotrexate Related Compound B RS, and 0.2 µg/mL of USP Methotrexate Related Compound E RS in *Solution A*, from *Standard stock solution B*

System suitability solution: Transfer a known quantity of USP Methotrexate System Suitability Mixture RS to a suitable volumetric flask, and dissolve in dimethyl sulfoxide equivalent to about 1% of the final volume. Add *Standard stock solution B* equivalent to 0.2% of the final volume, and dilute with *Solution A* to volume to prepare 0.1 mg/mL of USP Methotrexate System Suitability Mixture RS, 0.2 µg/mL of USP Methotrexate Related Compound B RS, 0.4 µg/mL of USP Methotrexate Related Compound C RS, and 0.2 µg/mL of USP Methotrexate Related Compound E RS.

System suitability

Samples: *Standard solution A* and *System suitability solution*

Suitability requirements

Resolution: NLT 1.7 between methotrexate related compound B and methotrexate related compound C, NLT 10.0 between methotrexate related compound C and methotrexate, and NLT 5.0 between methotrexate related compound I and methotrexate related compound H; *System suitability solution*

Relative standard deviation: NMT 5.0%, *Standard solution A*

Analysis

Samples: *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of methotrexate related compound B and methotrexate related compound C in the portion of Methotrexate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from *Standard solution B*
 C_S = concentration of the corresponding methotrexate related compound in *Standard solution B* (mg/mL)
 C_U = concentration of Methotrexate in the *Sample solution* (mg/mL)

Calculate the percentage of methotrexate related compound E free base in the portion of Methotrexate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response from *Standard solution B*
 C_S = concentration of USP Methotrexate Related Compound E RS in *Standard solution B* (mg/mL)
 C_U = concentration of Methotrexate in the *Sample solution* (mg/mL)
 M_{r1} = molecular weight of methotrexate related compound E free base, 325.33
 M_{r2} = molecular weight of USP Methotrexate Related Compound E RS, 343.56

[NOTE—USP Methotrexate Related Compound E RS is 4-[[[(2,4-diaminopteridin-6-yl)methyl](methyl)amino]benzoic acid, hemihydrochloride.]

Calculate the percentage of methotrexate related compound H, methotrexate related compound I, and any unspecified impurity in the portion of Methotrexate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- r_U = peak response from the *Sample solution*
 r_S = peak response of methotrexate from *Standard solution A*
 C_S = concentration of USP Methotrexate RS in *Standard solution A* (mg/mL)
 C_U = concentration of Methotrexate in the *Sample solution* (mg/mL)
 F = relative response factor for each individual impurity (see *Impurity Table 1*)

Acceptance criteria

Individual impurities: See *Impurity Table 1*. [NOTE—Disregard any impurity peak less than 0.05%.]

Total impurities: NMT 1.0%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Methotrexate related compound B ^a	0.71	—	0.3
Methotrexate related compound C ^b	0.75	—	0.5

Methotrexate Injection

DEFINITION

Methotrexate Injection is a sterile solution of Methotrexate in Water for Injection prepared with the aid of Sodium Hydroxide. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$).

IDENTIFICATION

• A. INFRARED ABSORPTION <197K>

Sample: Dilute, if necessary, a volume of Injection, equivalent to about 25 mg of methotrexate, with water to obtain a solution having a concentration of about 2.5 mg/mL. Adjust with 0.1 N hydrochloric acid to a pH of 4.0. Place the slurry in a 50-mL centrifuge tube, and centrifuge. Decant the supernatant, add 25 mL of acetone, shake, and filter through a solvent-resistant membrane filter of 0.45-µm pore size. Air-dry the filtered precipitate.

Acceptance criteria: Meets the requirements

ASSAY

• PROCEDURE

Buffer: 0.2 M dibasic sodium phosphate and 0.1 M citric acid (63:37), adjusted if necessary with 0.1 M citric acid or 0.2 M dibasic sodium phosphate to a pH of 6.0

Mobile phase: Acetonitrile and *Buffer* (10:90)

System suitability solution: 0.1 mg/mL each of USP Methotrexate RS and folic acid in *Mobile phase*

Standard solution: 100 µg/mL of USP Methotrexate RS in *Mobile phase*

Sample solution: Equivalent to 100 µg/mL of methotrexate from Injection in *Mobile phase*

Methotrexate for Injection**DEFINITION**

Methotrexate for Injection is a sterile, freeze-dried preparation of methotrexate sodium with or without suitable added substances, buffers, and/or diluents. It contains NLT 95.0% and NMT 115.0% of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$).

[CAUTION—Great care should be taken to prevent inhaling particles of methotrexate sodium and exposure to skin.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**

Sample: 2.5 mg/mL of methotrexate in water from Methotrexate for Injection. Adjust with 0.1 N hydrochloric acid to a pH of 4.0. Place the slurry in a 50-mL centrifuge tube, and centrifuge. Decant the supernatant, add 25 mL of acetone, shake, and filter through a solvent-resistant membrane filter of 0.45-µm pore size. Air-dry the filtered precipitate.

USP Endotoxin RS
USP Methotrexate RS

Methotrexate Tablets

DEFINITION

Methotrexate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$).

IDENTIFICATION

• **A. ULTRAVIOLET ABSORPTION** (197U)

Standard solution: 25 µg/mL of USP Methotrexate RS in dilute hydrochloric acid (1 in 100)

Sample solution: Dissolve 1 Tablet in 100 mL of dilute hydrochloric acid (1 in 100), and filter the solution.

Acceptance criteria: The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*.

ASSAY

• **PROCEDURE**

Buffer: 0.2 M dibasic sodium phosphate and 0.1 M citric acid (63:37), adjusted if necessary with 0.1 M citric acid or 0.2 M dibasic sodium phosphate to a pH of 6.0

Mobile phase: Acetonitrile and *Buffer* (10:90)

System suitability solution: 0.1 mg/mL each of USP Methotrexate RS and folic acid in *Mobile phase*

Standard solution: 100 µg/mL of USP Methotrexate RS in *Mobile phase*

Sample solution: Equivalent to 100 µg/mL of methotrexate from powdered Tablets (NLT 20 Tablets) in *Mobile phase*. Dissolve the methotrexate using a mechanical shaker or ultrasonic bath.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 302 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.2 mL/min

Injection volume: 10 µL

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for folic acid and methotrexate are 0.35 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 8.0 between the folic acid and methotrexate peaks

Relative standard deviation: NMT 2.5% for the methotrexate peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methotrexate RS in the *Standard solution* (µg/mL)

C_U = nominal concentration of methotrexate in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• **DISSOLUTION** (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 45 min

Standard solution: USP Methotrexate RS in *Medium*

Detector: UV 306 nm (maximum absorbance)

Analysis: Determine the amount of $C_{20}H_{22}N_8O_5$ dissolved from UV absorbances on filtered portions of the solution under test, suitably diluted with *Medium*, in comparison with a *Standard solution*.

Tolerances: NLT 75% (Q) of the labeled amount of methotrexate ($C_{20}H_{22}N_8O_5$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers. A unit-of-use container contains a quantity of Tablets sufficient to provide one week's therapy as indicated in the labeling.

• **LABELING:** When packaged in a unit-of-use container, the label indicates the total amount of methotrexate present as one week's supply.

• **USP REFERENCE STANDARDS** (11)
USP Methotrexate RS

Methotrimoprazine

$C_{19}H_{24}N_2OS$ 328.47
10*H*-Phenothiazine-10-propanamine, 2-methoxy-*N,N*,β-trimethyl-, (–)-;
(–)-10-[3-(Dimethylamino)-2-methylpropyl]-2-methoxyphenothiazine [60-99-1].

DEFINITION

Methotrimoprazine contains NLT 98.0% and NMT 101.0% of methotrimoprazine ($C_{19}H_{24}N_2OS$), calculated on the dried basis.

[NOTE—Throughout the following procedures, protect test or assay specimens, the USP Reference Standard, and the solutions containing them by conducting the procedures without delay under subdued light or by using low-actinic glassware.]

IDENTIFICATION

• **A. INFRARED ABSORPTION** (197K)

• **B. ULTRAVIOLET ABSORPTION** (197U)

Solution: 7 µg/mL

Medium: Alcohol

Acceptance criteria: Absorptivities at 255 nm, calculated on the dried basis, do not differ by more than 3.0%.

ASSAY

• **PROCEDURE**

Sample solution: Dissolve about 700 mg of Methotrimoprazine in 100 mL of chloroform. Add 1 drop of a solution (1 in 500) of crystal violet in chloroform.

Analysis: Titrate the *Sample solution* with 0.1 N perchloric acid VS to the first disappearance of the violet tinge. Perform a blank determination, and make any necessary

correction. Each mL of 0.1 N perchloric acid is equivalent to 32.85 mg of methotrimeprazine ($C_{19}H_{24}N_2OS$).
Acceptance criteria: 98.0%–101.0% on the dried basis

IMPURITIES

- **SELENIUM (291)**
Test solution: Prepare with 100 mg of Methotrimeprazine and 100 mg of magnesium oxide.
Acceptance criteria: The absorbance of the *Test solution* is NMT one-half that of the *Standard Solution* (0.003%).

SPECIFIC TESTS

- **OPTICAL ROTATION, Specific Rotation (781S)**
Sample solution: 50 mg/mL in chloroform
Acceptance criteria: -15° to -18°
- **LOSS ON DRYING (731)**
Analysis: Dry at 100° for 3 h.
Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers. Store at 25° , excursions permitted between 15° and 30° .
- **USP REFERENCE STANDARDS (11)**
 USP Methotrimeprazine RS

Methotrimeprazine Injection

DEFINITION

Methotrimeprazine Injection is a sterile solution of Methotrimeprazine in Water for Injection, prepared with the aid of hydrochloric acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of methotrimeprazine ($C_{19}H_{24}N_2OS$), as the hydrochloride.

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay under subdued light or by using low-actinic glassware.]

IDENTIFICATION

- **A. INFRARED ABSORPTION (197K)**
Sample: Place 1 mL of Injection in a 125-mL separator, and add 1 N sodium hydroxide dropwise until the solution becomes opaque white. Extract with 50 mL of ether, wash the ether extract with 25 mL of water, and discard the washing. Filter the ether extract through a layer of anhydrous sodium sulfate into a beaker, and evaporate the filtrate by means of a stream of nitrogen to complete dryness. Dry at 100° for 3 h.
Acceptance criteria: Meets the requirements

ASSAY

- **PROCEDURE**
Solution A: Transfer 23.5 mL of 85% phosphoric acid into a 100-mL volumetric flask containing water, and dilute with water to volume.
Mobile phase: Add 20 mL of *Solution A* to 450 mL of water. To this solution add 5 mL of triethylamine, and adjust with 1 N sodium hydroxide to a pH of 3.0. Add 500 mL of acetonitrile, and dilute with water to 1000 mL. Filter, and degas.
System suitability solution: 2.0 mg/mL of benzyl alcohol, using appropriate amounts of 1% benzyl alcohol, and 0.1 mg/mL of USP Methotrimeprazine RS in *Mobile phase*
Standard solution: 0.1 mg/mL of USP Methotrimeprazine RS in *Mobile phase*
Sample solution: Nominally equivalent to 0.1 mg/mL of methotrimeprazine in *Mobile phase* from an appropriate amount of Injection

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4.6-mm \times 25-cm; packing L7

Flow rate: 1 mL/min

Injection volume: 20 μ L

System suitability

Samples: *System suitability solution* and *Standard solution*

Suitability requirements

Resolution: NLT 4.0 between benzyl alcohol and methotrimeprazine, *System suitability solution*

Tailing factor: NMT 1.2, *System suitability solution*

Relative standard deviation: NMT 1.5%, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methotrimeprazine ($C_{19}H_{24}N_2OS$) in the portion of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methotrimeprazine RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methotrimeprazine in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 3.0–5.0

- **OTHER REQUIREMENTS:** It meets the requirements in *Injections and Implanted Drug Products* (1).

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.
- **USP REFERENCE STANDARDS (11)**
 USP Endotoxin RS
 USP Methotrimeprazine RS

Methoxsalen

$C_{12}H_8O_4$ 216.19

7H-Furo[3,2-g][1]benzopyran-7-one, 9-methoxy-

9-Methoxy-7H-furo[3,2-g][1]benzopyran-7-one [298-81-7].

» Methoxsalen contains not less than 98.0 percent and not more than 102.0 percent of $C_{12}H_8O_4$, calculated on the anhydrous basis.
Caution—Avoid contact with the skin.

Packaging and storage—Preserve in well-closed, light-resistant containers.

USP Reference standards (11)—

USP Methoxsalen RS

Identification, Infrared Absorption (197K).

Melting range, Class I (741): between 143° and 148° .

Water Determination, Method I (921): not more than 0.5%.

Residue on ignition (281): not more than 0.1%, a 1-g specimen being used.

Delete the following:

• **Heavy metals, Method II** (231): 0.002%. (Official 1-Jan-2018)

Chromatographic impurities—Prepare a solution of it in chloroform containing about 20 mg per mL (*Solution A*). Dilute 1.0 mL of it with chloroform to 100.0 mL (*Solution B*). Apply 5- μ L portions of both solutions at points along a line about 2.5 cm from one edge of a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture and previously dried at 105° for 30 minutes. Develop the plate in a suitable chamber, without previous equilibration, using a mixture of 9 volumes of benzene and 1 volume of ethyl acetate, until the solvent front has moved to about 15 cm above the line of application. Remove the plate from the chamber, air-dry, and observe under long-wavelength UV light: any spot in the chromatogram from *Solution A*, other than the principal spot, is not more intense than the spot from *Solution B* (1.0%).

Assay—

Mobile phase—Prepare a solution of acetonitrile in water (35 in 100). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Internal standard preparation—Dissolve trioxsalen in alcohol to obtain a solution containing about 0.2 mg per mL.

Standard preparation—Using an accurately weighed quantity of USP Methoxsalen RS, prepare a solution in alcohol having a known concentration of about 0.2 mg per mL. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard preparation*, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 4 μ g of USP Methoxsalen RS per mL. Pass through a 0.45- μ m disk before using.

Assay preparation—Using 20 mg of Methoxsalen, accurately weighed, proceed as directed for *Standard preparation*.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm \times 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between the analyte and internal standard peaks is not less than 4.0, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 2.1 for trioxsalen and 1.0 for methoxsalen. Calculate the quantity, in mg, of $C_{12}H_8O_4$, in the portion of Methoxsalen taken by the formula:

$$5C(R_U / R_S)$$

in which *C* is the concentration, in μ g per mL, of USP Methoxsalen RS in the *Standard preparation*; and *R_U* and *R_S* are the ratios of the peak responses of methoxsalen to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methoxsalen Capsules

» Methoxsalen Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methoxsalen ($C_{12}H_8O_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

Labeling—Label the Capsules to state that Methoxsalen Hard Gelatin Capsules may not be interchangeable with Methoxsalen Soft Gelatin Capsules without retitration of the patient.

USP Reference standards (11)—

USP Methoxsalen RS

Identification—

A: The retention time exhibited by methoxsalen in the chromatogram of the *Assay preparation* corresponds to that of methoxsalen in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

B: Place one Capsule in 50 mL of alcohol contained in a high-speed glass blender jar and blend thoroughly until the shell is completely dispersed. Dilute a portion quantitatively with alcohol to obtain a solution having a concentration of about 4 μ g per mL: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Methoxsalen RS, concomitantly measured.

Dissolution (711)—

FOR SOFT GELATIN CAPSULES—

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Procedure—Determine the amount of $C_{12}H_8O_4$ dissolved from UV absorbances at the wavelength of maximum absorbance at about 300 nm using filtered portions of the solution under test, suitably diluted with water, if necessary, in comparison with a *Standard solution* having a known concentration of USP Methoxsalen RS in the same *Medium*. [NOTE—An amount of alcohol not to exceed 1% of the total volume of the *Standard solution* may be used to bring the *Reference Standard* into solution prior to dilution with *Medium*.]

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{12}H_8O_4$ is dissolved in 45 minutes.

FOR HARD GELATIN CAPSULES—

Medium: water; 900 mL.

Apparatus 1: 150 rpm.

Time: 90 minutes.

Procedure—Determine the amount of $C_{12}H_8O_4$ dissolved from UV absorbances at the wavelength of maximum absorbances at about 252 nm of filtered portions of the solution under test in comparison with a *Standard solution* having a known concentration of USP Methoxsalen RS prepared in alcohol and diluted with water.

Tolerances—Not less than 75% (*Q*) of the labeled amount of $C_{12}H_8O_4$ is dissolved in 90 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile and water (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Prepare a solution in alcohol having an accurately known concentration of 0.2 mg of USP Methoxsalen RS per mL. Pipet 2.0 mL of this solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

Assay preparation—

FOR HARD GELATIN CAPSULES—Place not less than 10 Capsules in a high-speed glass blender jar containing 100.0 mL of alcohol, and blend thoroughly. Transfer an accurately measured volume of the aliquot from the blender jar, equivalent to about 2 mg of Methoxsalen, to a 50-mL volumetric flask, dilute with alcohol to volume, mix, and filter. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter.

FOR SOFT GELATIN CAPSULES—Place the end of a long-stem glass funnel on a 250-mL volumetric flask, punch a hole at each end of a Capsule with a syringe containing 15 mL of alcohol, and rinse the contents into the flask. Cut the Capsule shell with a scalpel, and wash the inside of the shell with 15 mL of alcohol into the same flask. Repeat these steps for not less than 4 additional Capsules, and collect the rinse. Wash the funnel, and collect the rinse in the same flask. Dilute with alcohol to volume, and mix. Transfer an accurately measured volume of this solution, equivalent to about 2 mg of methoxsalen, to a 50-mL volumetric flask, dilute with alcohol to volume, mix, and filter. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in percentage of the label claim, of methoxsalen (C₁₂H₈O₄) in the portion of the Capsule taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which C_s is the concentration, in mg per mL, of USP Methoxsalen RS in the *Standard preparation*; C_u is the nominal concentration, in mg per mL, of methoxsalen in the *Assay preparation*, based on the label claim; and r_u and r_s are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methoxsalen Topical Solution

» Methoxsalen Topical Solution is a solution of Methoxsalen in a suitable vehicle. It contains not less than 9.2 mg and not more than 10.8 mg of methoxsalen (C₁₂H₈O₄) per mL.

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—

USP Methoxsalen RS

Identification—Transfer a volume of Topical Solution to a 100-mL volumetric flask, and dilute quantitatively and stepwise with alcohol to obtain a concentration of about 8 µg per mL: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Methoxsalen RS, concomitantly measured.

Alcohol Determination (611) (if present): between 66.5% and 77.0% of C₂H₅OH.

Assay—

*Mobile phase, Internal standard preparation, Standard preparation, and Chromatographic system—*Prepare as directed in the Assay under *Methoxsalen*.

Assay preparation—Transfer an accurately measured volume of Topical Solution, equivalent to about 20 mg of methoxsalen, to a 100-mL volumetric flask. Dilute with alcohol to volume, and mix. Transfer 2.0 mL of this solution and 2.0 mL of *Internal standard preparation* to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Pass through a 0.45-µm disk before using.

Procedure—Proceed as directed for *Procedure* in the Assay under *Methoxsalen*. Calculate the quantity, in mg, of methoxsalen (C₁₂H₈O₄) in each mL of the Topical Solution taken by the formula:

$$5(C/V)(R_u / R_s)$$

in which V is the volume, in mL, of Topical Solution taken, and the other terms are as defined therein.

Methoxyflurane

C₃H₄Cl₂F₂O

164.97

Ethane, 2,2-dichloro-1,1-difluoro-1-methoxy-;
2,2-Dichloro-1,1-difluoroethyl methyl ether [76-38-0].

DEFINITION

Methoxyflurane contains NLT 99.9% and NMT 100.0% of methoxyflurane (C₃H₄Cl₂F₂O). It may contain a suitable stabilizer.

IDENTIFICATION

- A. INFRARED ABSORPTION**

Standard solution: USP Methoxyflurane RS (1 in 20) in chloroform

Sample solution: Methoxyflurane (1 in 20) in chloroform

Acceptance criteria: The IR absorption spectrum of the *Sample solution* exhibits maxima only at the same wavelengths as those of the *Standard solution*.

- B.**

Sample: Methoxyflurane

Analysis: To 1 mL of the *Sample* in a test tube add 1 mL of sulfuric acid.

Acceptance criteria: The *Sample* forms a layer over the acid (distinction from halothane).

- C.**

Analysis: Cautiously heat the contents of the test tube from *Identification* test B with agitation.

Acceptance criteria: The interface disappears, and hydrofluoric acid is evolved (distinction from chloroform, trichloroethylene, and halothane).

ASSAY

- PROCEDURE**

Sample: Methoxyflurane

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: GC

Detector: Thermal conductivity

Column: 4-mm × 3-m; stainless steel packed with liquid phase G11 on support S1A

Temperatures

Injection port: 150°

Column: 100°–110°

Carrier gas: Dry helium

Flow rate: 60 mL/min

Injection volume: NMT 30 µL

AnalysisSample: *Sample*Calculate the percentage of methoxyflurane (C₃H₄Cl₂F₂O) in the portion of Methoxyflurane taken:

$$\text{Result} = (r_U/r_T) \times 100$$

 r_U = peak area of methoxyflurane r_T = sum of all the peak areas

Acceptance criteria: 99.9%–100.0%

SPECIFIC TESTS

- **SPECIFIC GRAVITY** (841): 1.420–1.425

- **ACIDITY**

Sample: 25 mL of Methoxyflurane

Titrimetric system

Mode: Direct titration

Titrant: 0.010 N sodium hydroxide

Endpoint detection: Visual

Analysis: Shake the *Sample* with 25 mL of carbon dioxide-free water for 2 min, and allow the layers to separate. Add 1 drop of methyl red TS to the water extract, boil for 1 min, and titrate with *Titrant*.

Acceptance criteria: NMT 0.50 mL of *Titrant* is required to produce a distinct yellow color.

- **WATER DETERMINATION, Method I** (921): NMT 0.1%

- **LIMIT OF NONVOLATILE RESIDUE**

Sample: 50 mL of Methoxyflurane

Analysis: Evaporate the *Sample* at room temperature in a tared evaporating dish, and dry the residue at 105° for 1 h.

Acceptance criteria: The weight of the residue does not exceed 1 mg.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and avoid exposure to excessive heat.
- **USP REFERENCE STANDARDS** (11)
USP Methoxyflurane RS

Methscopolamine BromideC₁₈H₂₄BrNO₄ 398.29

3-Oxa-9-azoniatricyclo[3.3.1.0^{2,4}]nonane, 7-(3-hydroxy-1-oxo-2-phenylpropoxy)-9,9-dimethyl-, bromide, [7(S)-(1α,2β,4β,5α,7β)-

6β,7β-Epoxy-3α-hydroxy-8-methyl-1αH,5αH-tropanium bromide (-)-tropate [155-41-9].

» Methscopolamine Bromide contains not less than 97.0 percent and not more than 103.0 percent of C₁₈H₂₄BrNO₄, calculated on the dried basis.

Packaging and storage—Preserve in tight, light-resistant containers, and store at room temperature.

USP Reference standards (11)—

USP Methscopolamine Bromide RS

USP Scopolamine Hydrobromide RS

IdentificationA: *Infrared Absorption* (197K).

B: A solution (1 in 20) meets the requirements of the tests for *Bromide* (191).

Specific rotation (781): between –21° and –25°, determined in a solution containing 500 mg in each 10 mL.

Loss on drying (731)—Dry it at 105° for 2 hours: it loses not more than 2.0% of its weight.

Residue on ignition (281): not more than 0.1%.

Chromatographic purity

Buffer solution, Solution A, Solution B, and Mobile phase—Proceed as directed in the *Assay*.

Standard solution—Prepare as directed for the *Standard preparation* in the *Assay*.

Diluted standard solution—Dilute 5 µL of the *Standard solution* with *Solution A* to 10.0 mL.

Test solution—Prepare as directed for the *Assay preparation*.

Scopolamine hydrobromide solution—Dissolve an accurately weighed quantity of USP Scopolamine Hydrobromide RS in *Solution A* to obtain a solution having a known concentration of about 0.05 mg per mL.

System suitability solution—Dissolve about 50 mg of USP Methscopolamine Bromide RS in *Solution A*, add 1.0 mL of *Scopolamine hydrobromide solution*, and dilute with *Solution A* to 50.0 mL. This solution contains about 0.1% of scopolamine hydrobromide.

Chromatographic system (see *Chromatography* (621))—Proceed as directed in the *Assay*. In addition, chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, R , between methscopolamine and scopolamine is not less than 1.5; and the tailing factor for the methscopolamine peak is not more than 2.0.

Procedure—Separately inject equal volumes (about 5 µL) of the *Diluted standard solution* and the *Test solution* into the chromatograph, record the chromatogram for four times the retention time of methscopolamine, and measure the responses for the major peaks. Disregard any peak with an area less than that of the methscopolamine peak in the chromatogram obtained from the *Diluted standard solution*, and disregard any peak that is due to *Solution A*. Calculate the percentage of each impurity in the portion of Methscopolamine Bromide taken by the formula:

$$100F(r_i/r_s)$$

in which F is the relative response factor for the methscopolamine bromide impurities (see *Table 1*); r_i is the peak area of any impurity obtained from the *Test solution*; and r_s is the peak area of methscopolamine obtained from the chromatogram of the *Test solution*: not more than 0.1% of any individual impurity is found; and not more than 0.5% of total impurities is found.

Table 1

Name	Relative Retention Time	Relative Response Factor (F)
Tropic acid	0.4	0.4
Scopolamine hydrobromide	0.9	1.0
Methylatropine bromide	1.2	1.0
Apomethscopolamine bromide	3.5	0.6
Any other impurity	—	1.0

Assay—

Buffer solution—Prepare a solution containing 5.16 g of sodium 1-hexanesulfonate monohydrate and 3.40 g of monobasic potassium phosphate in 1000 mL of water, adjust with 1 M phosphoric acid to a pH of 2.8, and mix.

Solution A—Mix 850 mL of *Buffer solution* and 150 mL of acetonitrile, filter, and degas.

Solution B—Mix 500 mL of *Buffer solution* and 500 mL of acetonitrile, filter, and degas.

Mobile phase—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Dissolve an accurately weighed quantity of USP Methscopolamine Bromide RS in *Solution A* to obtain a solution having a known concentration of about 1.0 mg per mL.

Assay preparation—Transfer about 50 mg of Methscopolamine Bromide, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Solution A* to volume, and mix.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 10-cm column that contains packing L1. The flow rate is about 3 mL per minute. The column temperature is maintained at 50°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–3	100	0	isocratic
3–10	100→85	0→15	linear gradient
10–10.1	85→100	15→0	linear gradient
10.1–13	100	0	re-equilibration

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for six replicate injections is not greater than 1%.

Procedure—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak area responses. Calculate the quantity, in mg, of $C_{18}H_{24}BrNO_4$ in the portion of Methscopolamine Bromide taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard preparation*; and r_U and r_S are the peak area responses of methscopolamine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methscopolamine Bromide Tablets

» Methscopolamine Bromide Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of methscopolamine bromide ($C_{18}H_{24}BrNO_4$).

Packaging and storage—Preserve in tight containers, and store at controlled room temperature.

USP Reference standards (11)—
USP Methscopolamine Bromide RS

Identification—

A: Thin-Layer Chromatographic Identification Test (201)—

pH 7.3 Dye-buffer solution—Prepare a solution containing, in each 500 mL, 200 mg of bromothymol blue, 3.2 mL of 0.1 N sodium hydroxide, 577.5 mg of citric acid monohydrate, and 6.3 mg of anhydrous dibasic sodium phosphate.

Test solution—Finely powder 1 Tablet, and transfer an amount, equivalent to about 0.5 mg of methscopolamine bromide, to a suitable container. Add 20 mL of water, heat for 5 minutes on a steam bath with frequent agitation, and centrifuge to obtain a clear supernatant. Transfer 10 mL of the supernatant to a vessel containing 10 mL of chloroform and 10 mL of pH 7.3 Dye-buffer solution. Shake vigorously for 3 minutes, centrifuge, and transfer 8 mL of the chloroform layer to a suitable container. Evaporate to dryness, and dissolve the residue in 1 mL of chloroform.

Standard solution—Prepare a solution in water containing about 0.025 mg of USP Methscopolamine Bromide RS per mL, and treat as directed above, beginning with "Transfer 10 mL of the supernatant."

Application volume: 50 µL.

Developing solvent system—In a suitable container, mix water, butyl alcohol, and glacial acetic acid (5:4:1), then transfer a measured volume of the upper organic layer to a suitable container, and mix with a volume of alcohol equivalent to 20% of the volume of the organic layer.

Procedure—Allow the solvent front to move about three-fourths of the length of the plate, remove the plate from the developing chamber, mark the solvent front, and dry the plate under a current of air for 30 minutes. Spray the plate evenly with potassium-bismuth iodide TS: the chromatogram of the *Test solution* shows a bright orange spot on a yellow background corresponding in R_f value (about 0.25) to that in the chromatogram obtained from the *Standard solution*. [NOTE—Bromothymol blue produces a dark yellow spot at an R_f value of about 0.8.]

B: Powder a number of Tablets, equivalent to about 5 mg of methscopolamine bromide, digest with 5 mL of water for 10 minutes, and filter: a portion of the clear solution so obtained responds to the test for *Bromide* (191).

Dissolution (711)—

Medium: 0.1 N hydrochloric acid; 500 mL.

Apparatus 2: 50 rpm.

Time: 30 minutes.

Determine the percentage of the labeled amount of methscopolamine bromide dissolved using the following method.

pH 3.0 Phosphate buffer—Dissolve 5.44 g of monobasic potassium phosphate in 1 L of water. Adjust with 1 N phosphoric acid to a pH of 3.0.

Mobile phase—Prepare a filtered and degassed mixture of pH 3.0 Phosphate buffer and methanol (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard solution—Dissolve an accurately weighed quantity of USP Methscopolamine Bromide RS in *Medium*, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration similar to the one expected in the *Test solution*.

Test solution—Use portions of the solution under test that have been passed through a 0.45-µm PTFE filter.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 204-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 25 μ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of methscopolamine bromide dissolved by the formula:

$$\frac{r_U \times C_S \times 500 \times 100}{r_S \times LC}$$

in which r_U and r_S are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively; C_S is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard solution*; 500 is the volume, in mL, of *Medium*; 100 is the factor for conversion to percentage; and LC is the tablet label claim, in mg.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{18}H_{24}BrNO_4$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—

Mobile phase—Prepare a solution containing 2.6 g of decyl sodium sulfate in 450 mL of water. Add 550 mL of methanol, adjust with 1 N sulfuric acid to a pH of 3.5, mix, filter, and degas.

Standard preparation—Transfer about 25 mg of USP Methscopolamine Bromide RS, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

Assay preparation—

FOR TABLETS THAT CONTAIN 2.5 MG OF METHSCOPOLAMINE BROMIDE—Place 10 Tablets in a 100-mL volumetric flask, add about 50 mL of *Mobile phase*, and sonicate for 30 minutes. Shake by mechanical means for 30 minutes, dilute with *Mobile phase* to volume, and mix. Pass a portion through a 0.45- μ m PTFE filter, discarding the first 2 to 3 mL of the filtrate.

FOR TABLETS THAT CONTAIN 5 MG OF METHSCOPOLAMINE BROMIDE—Place 10 Tablets in a 200-mL volumetric flask, add about 100 mL of *Mobile phase*, and sonicate for 30 minutes. Shake by mechanical means for 30 minutes, dilute with *Mobile phase* to volume, and mix. Pass a portion through a 0.45- μ m PTFE filter, discarding the first 2 to 3 mL of the filtrate.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm \times 25-cm column that contains packing L1. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject a volume (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the quantity, in mg, of methscopolamine bromide ($C_{18}H_{24}BrNO_4$) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Methscopolamine Bromide RS in the *Standard preparation*; and r_U and r_S are the peak responses of the methscopolamine bromide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methsuximide

$C_{12}H_{13}NO_2$

203.24

2,5-Pyrrolidinedione, 1,3-dimethyl-3-phenyl-, (\pm)-; (\pm)-N,2-Dimethyl-2-phenylsuccinimide [77-41-8].

DEFINITION

Methsuximide contains NLT 97.0% and NMT 103.0% of methsuximide ($C_{12}H_{13}NO_2$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

 $C_7H_{10}ClN_3O_4S_2$ 299.76**Identification—****A:** Infrared Absorption (197K).**B:** Ultraviolet Absorption (197U)—*Solution:* 20 µg per mL.*Medium:* methanol.**C:** Fuse about 100 mg of it with a pellet of sodium hydroxide: the ammonia fumes produced turn moistened red litmus paper blue. The fused mixture responds to the test for *Sulfite* (191).**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.**Residue on ignition** (281): not more than 0.2%.**Chloride** (221)—Shake 750 mg with 25 mL of water for 2 minutes, filter through a suitable membrane filter, and add 4 or 5 drops of 2 N nitric acid: the acidified filtrate shows no more chloride than corresponds to 0.20 mL of 0.020 N hydrochloric acid (0.02%).**Selenium** (291): 0.003%.**Delete the following:****•Heavy metals, Method II** (231): 0.002%. • (Official 1-Jan-2018)**Diazotizable substances—****Standard preparation**—Transfer about 10 mg of USP Methyclothiazide Related Compound A RS, accurately weighed, to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. Pipet 25 mL of the solution into a 100-mL volumetric flask, dilute with acetonitrile to volume, and mix. Each mL of *Standard preparation* contains about 50 µg of the Reference Standard.**Test preparation**—Transfer about 500 mg of Methyclothiazide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix.**Procedure**—Pipet 2 mL each of the *Standard preparation* and the *Test preparation* into separate 50-mL volumetric flasks. Pipet 2 mL of acetonitrile into a third 50-mL flask to provide the blank. To each flask add 4 mL of 0.1 N hydrochloric acid, and mix. Add 3.0 mL of sodium nitrite solution (1 in 200) to each flask, mix, and place the flasks in an ice bath for 5 minutes, shaking occasionally. Add to each flask 3.0 mL of ammonium sulfamate solution (1 in 50), mix, and allow the flasks to remain in the ice bath for 1 additional minute. Remove the flasks from the ice bath, add 1.0 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000), and mix. Allow the flasks to stand at room temperature for 1 minute, then dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions obtained from the *Standard preparation* and the *Test preparation* in 1-cm cells at 525 nm, with a suitable spectrophotometer, using the reagent blank to set the instrument. The absorbance of the solution from the *Test preparation* does not exceed that of the solution from the *Standard preparation*, corresponding to not more than 1.0% of diazotizable substances.**Assay**—Transfer about 350 mg of Methyclothiazide, accurately weighed, to a 250-mL conical flask, add 40 mL of a 1 in 20 solution of potassium hydroxide in methanol, and reflux at full boil for 1 hour. Cool, rinse the inner walls of the condenser with 20 mL of water and two 20-mL portions of methanol, add 10 mL of glacial acetic acid and 2 drops of eosin Y TS, and titrate with 0.1 N silver nitrate VS to the first appearance of a definite pink color. Each mL of 0.1 N silver nitrate is equivalent to 36.02 mg of $C_7H_{11}Cl_2N_3O_4S_2$.**Methyclothiazide Tablets**» Methyclothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methyclothiazide ($C_9H_{11}Cl_2N_3O_4S_2$).**Packaging and storage**—Preserve in well-closed containers.**USP Reference standards (11)—**

USP Methyclothiazide RS

Identification, Ultraviolet Absorption (197U)—**Solution**—Powder a number of Tablets, equivalent to about 50 mg of methyclothiazide, and transfer to a 100-mL volumetric flask with the aid of methanol. Add about 60 mL of methanol, and shake the flask for 1 hour. Dilute with methanol to volume, mix, and centrifuge a portion of the solution. Pipet 2 mL of the clear supernatant into a second 100-mL volumetric flask, dilute with methanol to volume, and mix: the UV absorption spectrum of this solution exhibits maxima and minima only at the same wavelengths as that of a similar solution of USP Methyclothiazide RS.**Dissolution** (711)—*Medium:* 0.01 N hydrochloric acid; 900 mL.*Apparatus 2:* 50 rpm.*Time:* 60 minutes.**Procedure**—Determine the amount of $C_9H_{11}Cl_2N_3O_4S_2$ dissolved by employing UV absorption at the wavelength of maximum absorbance at about 270 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Methyclothiazide RS in the same *Medium*. An amount of alcohol not to exceed 1% of the total volume of the Standard solution may be used to dissolve USP Methyclothiazide RS prior to dilution with *Dissolution Medium*.**Tolerances**—Not less than 70% (*Q*) of the labeled amount of $C_9H_{11}Cl_2N_3O_4S_2$ is dissolved in 60 minutes.**Uniformity of dosage units** (905): meet the requirements.**Procedure for content uniformity**—Transfer 1 finely powdered Tablet to a 50-mL volumetric flask, add about 30 mL of methanol, and shake by mechanical means for 1 hour. Dilute with methanol to volume, mix, and centrifuge a portion of the mixture. Dilute quantitatively with methanol to obtain a solution containing approximately 10 µg per mL of methyclothiazide. Concomitantly determine the absorbances of this solution and a Standard solution of USP Methyclothiazide RS in the same medium, having a known concentration of about 10 µg per mL, in 1-cm cells at the wavelength of maximum absorbance at about 267 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of $C_9H_{11}Cl_2N_3O_4S_2$ in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of methyclothiazide in the Tablet; *C* is the concentration, in µg per mL, of USP Methyclothiazide RS in the Standard solution; *D* is the concentration, in µg per mL, of methyclothiazide in the solution from the Tablet, based upon the labeled quantity per Tablet and the extent of dilution; and *A_U* and *A_S* are the absorbances of the solution from the Tablet and the Standard solution, respectively.**Assay—****Standard preparation**—Transfer about 20 mg of USP Methyclothiazide RS, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer

10.0 mL of this solution to a 200-mL volumetric flask, add chloroform to volume, and mix.

Assay preparation—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of methyclothiazide, to a 150-mL beaker, add 2.0 mL of methanol, mix, allow the mixture to stand for 30 minutes while taking precautions against loss of solvent, add 2.0 mL of 0.1 M sodium bicarbonate, and mix.

Procedure—[NOTE—Use water-saturated solvents throughout this procedure.] Mix about 3 g of chromatographic siliceous earth with 2.0 mL of 0.1 M sodium bicarbonate in a 150-mL beaker. Pack the mixture into a 25- × 200-mm chromatographic column. Add 4 g of chromatographic siliceous earth to the *Assay preparation*, mix, transfer the mixture to the column, and pack. Dry-wash the beaker with 1 g of the siliceous earth mixed with 3 drops of water, and transfer to the column. Place a small pad of glass wool above the column packing, pass 75 mL of a mixture of isooctane and ether (9:1) through the column, and discard the eluate. Using a 200-mL volumetric flask as a receiver, pass 100 mL of chloroform through the column, wash the tip of column with ether, add 10.0 mL of methanol, dilute with chloroform to volume, and mix. Concomitantly determine the absorbances of this solution and the *Standard preparation* at the wavelength of maximum absorbance at about 268 nm, with a suitable spectrophotometer, using chloroform as the blank. Calculate the quantity, in mg, of methyclothiazide ($C_9H_{11}Cl_2N_3O_4S_2$) in the portion of Tablets taken by the formula:

$$0.2C(A_U / A_S)$$

in which C is the concentration, in μg per mL, of USP Methyclothiazide RS in the *Standard preparation*; and A_U and A_S are the absorbances of the solution from the *Assay preparation* and the *Standard preparation*, respectively.

Methylbenzethonium Chloride

$C_{28}H_{44}ClNO_2 \cdot H_2O$ 480.12

$C_{28}H_{44}ClNO_2$ 462.12

Benzenemethanaminium, *N,N*-dimethyl-*N*-[2-[2-[methyl-4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]-, chloride, monohydrate;

Benzyltrimethyl[2-[2-[[4-(1,1,3,3-tetramethylbutyl)tolyl]oxy]ethoxy]ethyl]ammonium chloride monohydrate [1320-44-1].

Anhydrous [25155-18-4].

DEFINITION

Methylbenzethonium Chloride contains NLT 97.0% and NMT 103.0% of $C_{28}H_{44}ClNO_2$, calculated on the dried basis.

IDENTIFICATION

A. PROCEDURE

Analysis: To 1 mL of solution (1 in 100) add 2 mL of alcohol, 0.5 mL of 2 N nitric acid, and 1 mL of silver nitrate TS.

Acceptance criteria: A white precipitate, which is insoluble in 2 N nitric acid and soluble in 6 N ammonium hydroxide, is formed.

B. INFRARED ABSORPTION (197K)

ASSAY

PROCEDURE

Buffer: Dilute 20 mL of triethylamine with water to 1000 mL, and adjust the pH to 3.0 with phosphoric acid.

Mobile phase: Acetonitrile and Buffer (45:55)

Standard solution: 0.15 mg/mL of USP

Methylbenzethonium Chloride RS in *Mobile phase*

System suitability solution: 0.15 mg/mL each of USP Benzethonium Chloride RS and USP

Methylbenzethonium Chloride RS in *Mobile phase*

Sample solution: 0.15 mg/mL of methylbenzethonium chloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 225 nm

Column: 4.6-mm × 15-cm; 5- μm packing L7

Column temperature: 40°

Flow rate: 1 mL/min

Injection size: 10 μL

Run time: 1.5 times the retention time of the methylbenzethonium peak

System suitability

Sample: *System suitability solution*

[NOTE—The relative retention times for benzethonium and methylbenzethonium are 0.7 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 5.0 between the benzethonium and methylbenzethonium peaks

Tailing factor: NMT 1.8 for the methylbenzethonium peak

Relative standard deviation: NMT 0.5% for the methylbenzethonium peak

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$) in the portion of Methylbenzethonium Chloride taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

r_U = peak response of methylbenzethonium from the *Sample solution*

r_S = peak response of methylbenzethonium from the *Standard solution*

C_S = concentration of USP Methylbenzethonium Chloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylbenzethonium Chloride in the *Sample solution* (mg/mL)

Acceptance criteria: 97.0%–103.0% on the dried basis

IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

SPECIFIC TESTS

• **MELTING RANGE OR TEMPERATURE** (741): 159°–163°, the specimen having been previously dried

• **LOSS ON DRYING** (731): Dry a sample at 105° for 4 h: it loses NMT 5.0% of its weight.

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** (11)

USP Benzethonium Chloride RS

USP Methylbenzethonium Chloride RS

Methylbenzethonium Chloride Lotion

DEFINITION

Methylbenzethonium Chloride Lotion is an emulsion containing NLT 90.0% and NMT 110.0% of the labeled amount of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$).

IDENTIFICATION

- **A.**
Sample: Suspend 0.5 mL of methylbenzethonium chloride lotion in 20 mL of water.
Analysis: Add 0.1 g of sodium carbonate, 1 mL of bromophenol blue TS, and 10 mL of chloroform to the *Sample*, and shake the mixture.
Acceptance criteria: The chloroform layer is blue.

ASSAY

- **PROCEDURE**
Standard stock solution: 4.446 mg/mL of USP Docusate Sodium RS in isopropyl alcohol (equivalent to 0.01 M of USP Docusate Sodium RS). Store this solution in a tightly-stoppered glass container. Prepare the *Standard solution* on the day of use.
Standard solution 44.46 µg/mL of USP Docusate Sodium RS in water from the *Standard stock solution* (equivalent to 0.1 mM of USP Docusate Sodium RS)
Sample solution: Transfer an amount of Lotion, equivalent to 0.5 mg of methylbenzethonium chloride, to a glass-stoppered, 50-mL cylinder. Add 5 mL of chloroform (freshly purified by shaking 100 mL with 10 g of silica gel, allowing to settle, and withdrawing the supernatant), 5 mL of phosphoric acid solution (1 in 10), and 1 mL of 0.05 mg/mL of safranin O solution.
Analysis: Titrate the *Sample solution* with the *Standard solution* until 1 mL from the endpoint, then shake the stoppered tube vigorously for about 2 min, and continue the titration in 0.1-mL increments, shaking vigorously after each addition, until a pink color appears in the chloroform layer. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of *Standard solution* is equivalent to 48.01 µg of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$).
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 5.2–6.0

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
 USP Docusate Sodium RS

Methylbenzethonium Chloride Ointment

DEFINITION

Methylbenzethonium Chloride Ointment contains NLT 90.0% and NMT 110.0% of the labeled amount of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$).

IDENTIFICATION

- **A.**
Sample: Suspend 0.5 g of methylbenzethonium chloride ointment in 10 mL of water.
Analysis: Add 0.1 g of sodium carbonate, 1 mL of bromophenol blue TS, and 10 mL of chloroform to the *Sample*, and shake the mixture.

Acceptance criteria: The chloroform layer is blue.

ASSAY

- **PROCEDURE**
Standard stock solution: 4.446 mg/mL of USP Docusate Sodium RS in isopropyl alcohol (equivalent to 0.01 M of USP Docusate Sodium RS). Store this solution in a tightly-stoppered glass container. Prepare the *Standard solution* on the day of use.
Standard solution 44.46 µg/mL of USP Docusate Sodium RS in water from the *Standard stock solution* (equivalent to 0.1 mM of USP Docusate Sodium RS)
Sample solution: Transfer an amount of Ointment, equivalent to 0.5 mg of methylbenzethonium chloride, to a glass-stoppered, 50-mL cylinder. Add 5 mL of chloroform (freshly purified by shaking 100 mL with 10 g of silica gel, allowing to settle, and withdrawing the supernatant), 5 mL of phosphoric acid solution (1 in 10), and 1 mL of 0.05 mg/mL of safranin O solution.
Analysis: Titrate the *Sample solution* with the *Standard solution* until 1 mL from the endpoint, then shake the stoppered tube vigorously for about 2 min, and continue the titration in 0.1-mL increments, shaking vigorously after each addition, until a pink color appears in the chloroform layer. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of *Standard solution* is equivalent to 48.01 µg of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$).
Acceptance criteria: 90.0%–110.0%

SPECIFIC TESTS

- **pH (791):** 5.0–7.0, in a dispersion of 10 mg/mL of the sample in carbon dioxide-free water

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers.
- **USP REFERENCE STANDARDS (11)**
 USP Docusate Sodium RS

Methylbenzethonium Chloride Topical Powder

DEFINITION

Methylbenzethonium Chloride Topical Powder contains NLT 85.0% and NMT 115.0% of the labeled amount of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$) in a suitable fine powder base, free from grittiness.

IDENTIFICATION

- **A.**
Sample: Suspend 0.1 g of methylbenzethonium chloride topical powder in 10 mL of water.
Analysis: Add 0.1 g of sodium carbonate, 1 mL of bromophenol blue TS, and 10 mL of chloroform to the *Sample*, and shake the mixture.
Acceptance criteria: The chloroform layer is blue.

ASSAY

- **PROCEDURE**
Standard stock solution: 4.446 mg/mL of USP Docusate Sodium RS in isopropyl alcohol (equivalent to 0.01 M of USP Docusate Sodium RS). Store this solution in a tightly-stoppered glass container. Prepare the *Standard solution* on the day of use.
Standard solution: 44.46 µg/mL of USP Docusate Sodium RS in water from the *Standard stock solution* (equivalent to 0.1 mM of USP Docusate Sodium RS)
Sample solution: Transfer an amount of Topical Powder, equivalent to 0.5 mg of methylbenzethonium chloride, to a glass-stoppered, 50-mL cylinder. Add 5 mL of

chloroform (freshly purified by shaking 100 mL with 10 g of silica gel, allowing to settle, and withdrawing the supernatant), 5 mL of phosphoric acid solution (1 in 10), and 1 mL of 0.05 mg/mL of safranin O solution.

Analysis: Titrate the *Sample solution* with the *Standard solution* until 1 mL from the endpoint, then shake the stoppered tube vigorously for about 2 min, and continue the titration in 0.1-mL increments, shaking vigorously after each addition, until a pink color appears in the chloroform layer. Each mL of *Standard solution* is equivalent to 48.01 µg of methylbenzethonium chloride ($C_{28}H_{44}ClNO_2 \cdot H_2O$).

Acceptance criteria: 85.0%–115.0%

SPECIFIC TESTS

- **pH (791):** 9.0–10.5, in a dispersion of 10 mg/mL of the sample in carbon dioxide-free water
- **POWDER FINENESS (811):** NLT 99% of it passes through a No. 200 sieve.

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS (11)**
USP Docusate Sodium RS

Methylcellulose

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (•) to specify this fact.

Cellulose, methyl ether;

Cellulose methyl ether [9004-67-5].

DEFINITION

Methylcellulose is a methyl ether of cellulose. When dried at 105° for 1 h, it contains NLT 26.0% and NMT 33.0% of methoxy ($-OCH_3$) groups.

IDENTIFICATION

- **A.**
Sample: 1 g
Analysis: Evenly distribute the *Sample* onto the surface of 100 mL of water in a beaker, tapping the top of the beaker gently, if necessary, to ensure a uniform layer on the surface, and allow to stand for 1–2 min.
Acceptance criteria: The powdered material aggregates on the surface.
- **B.**
Sample: 1 g
Analysis: Evenly distribute the *Sample* into 100 mL of boiling water and stir the mixture using a magnetic stirrer with a 25-mm long bar: a slurry is formed and the particles do not dissolve. Allow the slurry to cool to 5° and stir using a magnetic stirrer.
Acceptance criteria: A clear or slightly turbid solution occurs with its thickness dependent on the viscosity grade.
- **C.**
Solution A: Sulfuric acid and water (9 in 10). [NOTE—Carefully add the sulfuric acid to the water.]
Sample solution: 0.1 mL of the solution prepared for *Identification test B*
Analysis: To the *Sample solution* add 9 mL of *Solution A* and shake. Heat in a water bath for exactly 3 min, immediately cool in an ice bath, and add carefully 0.6 mL of ninhydrin TS. Shake and allow to stand at 25°.
Acceptance criteria: A red color develops immediately and it does not change to purple within 100 min.

D.

Sample solution: 2–3 mL of the solution prepared for *Identification test B*

Analysis: Pour the *Sample solution* onto a glass slide as a thin film and allow the water to evaporate.

Acceptance criteria: A coherent, clear film forms on the glass slide.

E.

Sample solution: 50 mL of the solution prepared in *Identification test B*

Analysis: Add the *Sample solution* to exactly 50 mL of water in a beaker. Insert a thermometer into the solution. Stir the solution on a magnetic stirrer/hot plate, and begin heating at a rate of 2°–5°/min. Determine the temperature at which a turbidity increase begins to occur and designate this temperature as the flocculation temperature.

Acceptance criteria: The flocculation temperature is higher than 50°.

ASSAY

PROCEDURE

[CAUTION—Perform all steps involving *Hydriodic acid* carefully, in a well-ventilated hood. Use goggles, acid-resistant gloves, and other appropriate safety equipment. Be exceedingly careful when handling the hot vials because they are under pressure. In the event of hydriodic exposure, wash with copious amounts of water, and seek medical attention at once.]

Apparatus

Reaction vial: A 5-mL pressure-tight serum vial, 20 mm in outside diameter, 50 mm in height, and 20 mm in outside diameter and 13 mm in inside diameter at the mouth, equipped with a pressure-tight septum having a polytetrafluoroethylene-faced butyl rubber and an airtight seal using an aluminum crimp or any sealing system that provides sufficient airtightness

Heater: A heating module with a square-shaped aluminum block having holes 20 mm in diameter and 32 mm in depth, so that the reaction vial fits. The heating module is also equipped with a magnetic stirrer capable of mixing the contents of the vial, or a reciprocal shaker that performs a reciprocating motion approximately 100 times/min can be used.

Hydriodic acid: Use a reagent having a specific gravity of at least 1.69, equivalent to 55%–57% hydrogen iodide (HI).

Internal standard solution: 30 mg/mL of *n*-octane in *o*-xylene

Standard solution: Into a suitable serum vial weigh 60–100 mg of adipic acid, add 2.0 mL of *Hydriodic acid*, and then pipet 2.0 mL of the *Internal standard solution* into the vial. Close the vial securely with a suitable septum stopper. Weigh the vial and contents, add 45 µL of methyl iodide with a syringe through the septum, weigh again, and calculate the weight of methyl iodide added, by difference. Shake, and allow the layers to separate. Use the upper layer as the *Standard solution*.

Sample solution: Transfer 0.065 g of Methylcellulose to a 5-mL thick-walled reaction vial equipped with a pressure-tight septum closure, add 60–100 mg of adipic acid, and pipet 2.0 mL of the *Internal standard solution* into the vial. Cautiously pipet 2.0 mL of *Hydriodic acid* into the mixture, immediately secure the closure, and weigh accurately. Using the magnetic stirrer from the heating module, or using a reciprocal shaker, mix the contents of the vial continuously for 60 min while heating the block so that the temperature of the contents is maintained at $130 \pm 2^\circ$. If a reciprocal shaker or magnetic stirrer cannot be used, shake the vial well by hand at 5-min intervals during the initial 30 min of the heating time. Allow the vial to cool, and weigh again. If the weight loss is less than 0.50% of the contents and there is no evidence of a leak, use the upper layer of the mixture as the *Sample solution*.

Chromatographic system**Mode:** GC**Detector:** Thermal conductivity or hydrogen flame ionization**Column:** 3- to 4-mm \times 1.8- to 3-m; packed with 10%-20% liquid phase G1, 125–150 μ m in diameter on 100- to 120-mesh support S1A. [NOTE—Use a column giving well-resolved peaks of methyl iodide and the internal standard, in that order.]**Column temperature:** 100°**Carrier gas:** Helium for the thermal conductivity detector, and helium or nitrogen for the hydrogen flame ionization detector**Flow rate:** Adjust so that the retention time of the internal standard is about 10 min.**Injection volume:** 1 or 2 μ L**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of methoxy in the portion of Methylcellulose taken:

$$\text{Result} = X \times (R_U/R_S) \times (W_S/W)$$

 X = ratio of the formula weights of methoxy to methyl iodide times 100%, 21.864 R_U = ratio of the peak area of methyl iodide to that of the internal standard from the *Sample solution* R_S = ratio of the peak area of methyl iodide to that of the internal standard from the *Standard solution* W_S = weight of methyl iodide in the *Standard solution* (mg) W = weight of Methylcellulose, calculated on the dried basis, taken for the *Assay* (mg)**Acceptance criteria:** 26.0%–33.0% calculated on the dried basis**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 1.5%

Delete the following:

- **HEAVY METALS** (231), *Method III*

Analysis: For the *Standard Preparation*, add the *Standard Lead Solution* before digestion. Omit the *Monitor Preparation*.**Acceptance criteria:** NMT 20 ppm; the color of the test solution is not darker than that of the control solution.

● (Official 1-Jan-2018)

SPECIFIC TESTS

- **LOSS ON DRYING** (731)

Analysis: Dry at 105° for 1 h.**Acceptance criteria:** NMT 5.0%

- **VISCOSITY—CAPILLARY METHODS** (911) and **VISCOSITY—ROTATIONAL METHODS** (912)

[NOTE—The density is 1.00 g/mL, so there is no necessity for determining the density at every measurement in the case of having the confirmation data.]

Method 1: This method is applied to samples with a viscosity of less than 600 mPa \cdot s. Weigh a quantity of Methylcellulose, equivalent to 4.000 g, calculated on the dried basis, transfer into a wide-mouth bottle, and add hot water (90°–99°) to obtain the total weight of the sample and water of 200.0 g. Cap the bottle and stir by mechanical means at 400 \pm 50 rpm for 10–20 min until particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle. Continue the stirring in

a cooling water bath equilibrated at a temperature below 5° for another 20–40 min. Adjust the solution weight, if necessary, to 200.0 g using cold water. Centrifuge the solution, if necessary, to expel any entrapped air bubbles. Using a spatula, remove any foam, if present. Perform the test with this solution at 20 \pm 0.1° to obtain the kinematic viscosity (ν). Separately, determine the density (ρ) of the solution, and calculate the viscosity (η) as $\eta = \rho\nu$.

Method 2: This method is applied to samples with a viscosity of 600 mPa \cdot s or higher. Weigh a quantity of Methylcellulose, equivalent to 10.00 g, calculated on the dried basis, transfer into a wide-mouth bottle, and add hot water (90°–99°) to obtain the total weight of the sample and water of 500.0 g. Capping the bottle, stir by mechanical means at 400 \pm 50 rpm for 10–20 min until particles are thoroughly dispersed and wetted out. Scrape down the walls of the bottle with a spatula, if necessary, to ensure that there is no undissolved material on the sides of the bottle. Continue the stirring in a cooling water bath equilibrated at a temperature below 5° for another 20–40 min. Adjust the solution weight, if necessary, to 500.0 g using cold water. Centrifuge the solution, if necessary, to expel any entrapped air bubbles. Using a spatula, remove any foam, if present. Determine the viscosity of this solution at 20 \pm 0.1° using a single-cylinder type rotational viscometer.

Apparatus: Brookfield type LV model or equivalent. For rotor no., revolution, and calculation multiplier, apply the conditions specified in *Table 1*.

Table 1

Labeled Viscosity ^a (mPa \cdot s)	Rotor No.	Revolution (rpm)	Calculation Multiplier
600 or more and less than 1400	3	60	20
1400 or more and less than 3500	3	12	100
3500 or more and less than 9500	4	60	100
9500 or more and less than 99,500	4	6	1000
99,500 or more	4	3	2000

^a The Labeled Viscosity is based on the manufacturer's specifications.

Operation of apparatus: Allow the spindle to rotate for 2 min before taking the measurement. Allow a rest period of at least 2 min between subsequent measurements. Repeat the operation to rotate the spindle specified above twice, and average the three readings.

Acceptance criteria: 80.0%–120.0% of that stated on the label for viscosity types less than 600 mPa \cdot s, and 75.0%–140.0% of that stated on the label for viscosity types 600 mPa \cdot s or higher

- **pH** (791)

Analysis: Measure the pH of the solution prepared in the test for *Viscosity*. Read the indicated pH value after the probe has been immersed for 5 \pm 0.5 min.

Acceptance criteria: 5.0–8.0**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label it to indicate its nominal viscosity type [viscosity of a solution (1 in 50)] in milli-Pascal seconds (mPa \cdot s).

Methylcellulose Ophthalmic Solution

» Methylcellulose Ophthalmic Solution is a sterile solution of Methylcellulose. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of methylcellulose. It may contain suitable antimicrobial, buffering, and stabilizing agents.

Packaging and storage—Preserve in tight containers.

Identification—

A: Heat a few mL of Ophthalmic Solution: the solution becomes cloudy and a flaky precipitate, which redissolves as the solution cools, appears.

B: Pour a few mL of Ophthalmic Solution onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.

Sterility Tests (71): meets the requirements.

pH (791): between 6.0 and 7.8.

Assay—To boiling flask A, as described under *Methoxy Determination* (431), pipet a quantity of Ophthalmic Solution, equivalent to 50 mg of methylcellulose. Evaporate on a steam bath to dryness, cool the flask in an ice bath, add the specified amount of hydriodic acid, and proceed as directed under *Methoxy Determination* (431). Each mL of 0.1 N sodium thiosulfate is equivalent to 1.753 mg of methylcellulose.

Methylcellulose Oral Solution

» Methylcellulose Oral Solution is a flavored solution of Methylcellulose. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of methylcellulose.

Packaging and storage—Preserve in tight, light-resistant containers, and avoid exposure to direct sunlight and to excessive heat. Avoid freezing.

Identification—

A: Heat a few mL of Oral Solution: the solution becomes cloudy and a flaky precipitate, which redissolves as the solution cools, appears.

B: Pour a few mL of Oral Solution onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.

Microbial enumeration tests (61) and **Tests for specified microorganisms** (62)—Its total aerobic microbial count does not exceed 100 cfu per mL, and it meets the requirements of the test for the absence of *Escherichia coli*.

Alcohol Determination, Method II (611): between 3.5% and 6.5% of C_2H_5OH .

Assay—To boiling flask A, as described under *Methoxy Determination* (431), transfer an accurately measured volume of Oral Solution, equivalent to 50 mg of methylcellulose. Evaporate on a steam bath to dryness, cool the flask in an ice bath, add the specified amount of hydriodic acid, and proceed as directed under *Methoxy Determination* (431). Each mL of 0.1 N sodium thiosulfate is equivalent to 1.753 mg of methylcellulose.

Methylcellulose Tablets

» Methylcellulose Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methylcellulose.

Packaging and storage—Preserve in well-closed containers.

Identification—

A: Gently add about 250 mg of the residue obtained in the Assay to the top of 25 mL of water in a beaker, and allow to disperse over the surface, tapping the top of the container to ensure an even dispersion of the test specimen. Allow the beaker to stand until the specimen becomes transparent and mucilaginous (about 5 hours), swirl the beaker to wet the remaining substance, add a stirring bar, and stir until dissolved: the mixture remains stable when an equal volume of 1 N sodium hydroxide or 1 N hydrochloric acid is added.

B: Heat a few mL of the solution prepared for Identification test A: the solution becomes cloudy, and a flaky precipitate, which redissolves as the solution cools, appears.

C: Pour a few mL of the solution prepared for Identification test A onto a glass plate, and allow the water to evaporate: a thin, self-sustaining film results.

Disintegration (701): 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Assay—Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 500 mg of methylcellulose, and transfer to a tared, fine fritted-glass, low-form, 30-mL crucible having a fitted crucible lid. Add 20 mL of alcohol, and macerate the solid for about 5 minutes, mixing intermittently with a glass stirring rod. Repeat the extraction with ten consecutive 10-mL portions of alcohol. Test for completeness of extraction by evaporating the last alcohol extract on a steam bath to dryness, taking up the residue in about 1 mL of water, and adding this to 5 mL of hot alkaline cupric tartrate TS (no red precipitate of cuprous oxide is formed within 5 minutes). If a precipitate is formed, continue with the alcohol extractions until the test is negative. Wash the completely extracted residue with a 10-mL portion of ether, using suction to drain off the liquid. Dry the residue in the crucible in a drying oven at 105° to constant weight. Weigh the crucible with the crucible lid in place. The weight of residue is the weight of methylcellulose present in the portion of powdered Tablets taken.

Methylropa

$C_{10}H_{13}NO_4 \cdot 1\frac{1}{2}H_2O$ 238.24

$C_{10}H_{13}NO_4$ 211.22

L-Tyrosine, 3-hydroxy- α -methyl-, sesquihydrate;
L-3-(3,4-Dihydroxyphenyl)-2-methylalanine sesquihydrate
[41372-08-1].

Anhydrous [555-30-6].

DEFINITION

Methylropa contains NLT 98.0% and NMT 101.0% of $C_{10}H_{13}NO_4$, calculated on the anhydrous basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)
Analytical wavelength: 280 nm
Sample solution: 40 µg/mL in 0.1 N hydrochloric acid
Acceptance criteria: Absorptivities, calculated on the anhydrous basis, do not differ by more than 3.0%.
- **C.**
Sample: 10 mg
Analysis: To the Sample add 0.15 mL of a solution of ninhydrin in sulfuric acid (1 in 250); a dark purple color is produced within 5–10 min. Add 0.15 mL of water.
Acceptance criteria: The color changes to pale brownish yellow.

ASSAY

- **PROCEDURE**
Sample solution: 200 mg of Methyldopa in 25 mL of glacial acetic acid, with the aid of heat. Cool to room temperature, and add 0.1 mL of crystal violet TS and 50 mL of acetonitrile.
Analysis: Titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 21.12 mg of $C_{10}H_{13}NO_4$.
Acceptance criteria: 98.0%–101.0% on the anhydrous basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS**, Method II (231): NMT 10 ppm (Official 1: Jan-2018)

• **LIMIT OF 3-O-METHYLMETHYLDOPA**

- Standard solution: 100 µg/mL of USP 3-O-Methylmethyldopa RS in methanol
Sample solution: 10 mg/mL of Methyldopa in methanol
Chromatographic system
(See *Chromatography* (621), *Thin-Layer Chromatography*.)
Mode: TLC
Developing solvent system: Butyl alcohol, glacial acetic acid, and water (65:15:25). [NOTE—Prepare this mixture fresh.]
Adsorbent: Thin-layer chromatographic plate with a suitable grade of cellulose, 250-µm thick, prewashed with the *Developing solvent system*. Wash the plate by placing it in a tank containing the *Developing solvent system*, and allowing the solvent to rise to the top of the plate. Dry with the aid of a current of dry air.
Solution A: 3 mg/mL of *p*-nitroaniline in 10 N hydrochloric acid. [NOTE—Prepare fresh solution, just before use.]
Solution B: 50 mg/mL of sodium nitrite. [NOTE—Prepare fresh solution, just before use.]
Spray reagent 1: Solution A and Solution B (9:1). [NOTE—Prepare fresh solution, just before spraying.]
Spray reagent 2: 250 mg/mL of sodium carbonate

Analysis

Samples: Standard solution and Sample solution
Apply 20 µL of the Sample solution in two 10-µL increments and 10 µL of the Standard solution so that the spots are NMT 0.5 cm in diameter. Develop using the *Developing solvent system* until the solvent front has moved about 10 cm from the origin. Remove the plate, and dry with a current of dry air until no odor of acetic acid is perceptible. Place the plate in a vertical position, and evenly spray with *Spray reagent 1* until the adsorbent layer is uniformly soaked down to the glass (do not overspray). Place the plate in a hori-

zontal position, and dry as completely as possible with a current of warm dry air (no odor of hydrochloric acid is perceptible). Place the plate in a vertical position, and evenly spray with *Spray reagent 2* until the plate is uniformly wet (do not overspray). The major methyldopa spot is black on a pale pink or orange background at an R_f value of 0.50, and the 3-O-methylmethyldopa spot is dark on a similar background at an R_f value of 0.65.

Acceptance criteria: The area and intensity of any 3-O-methylmethyldopa spot from the Sample solution are NMT those from the Standard solution (0.5%).

SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* (781S): -25° to -28°
Sample solution: 44 mg/mL in a solvent that is a solution of aluminum chloride in water (2 in 3) that previously has been treated with activated charcoal, filtered, and adjusted with 0.25 N sodium hydroxide to a pH of 1.5
- **ACIDITY**: Dissolve 1.0 g in carbon dioxide-free water with the aid of heat, add 1 drop of methyl red TS, and titrate with 0.10 N sodium hydroxide to a yellow endpoint: NMT 0.50 mL is required.
- **WATER DETERMINATION**, Method I (921): 10.0%–13.0%

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE**: Preserve in well-closed, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)
USP Methyldopa RS
USP 3-O-Methylmethyldopa RS

Methyldopa Oral Suspension

» Methyldopa Oral Suspension is an aqueous suspension of Methyldopa. It contains one or more suitable flavors, wetting agents, and preservatives, and it may contain Sucrose. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of $C_{10}H_{13}NO_4$.

Packaging and storage—Preserve in tight, light-resistant containers, and store at a temperature not exceeding 26° .

USP Reference standards (11)—

USP Methyldopa RS

Identification—Apply 10-µL portions of the *Assay preparation* and the *Standard preparation* prepared as directed in the *Assay* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow to dry, develop the chromatogram in a solvent system consisting of equal volumes of acetone, butyl alcohol, glacial acetic acid, toluene, and water until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by staining the plate with iodine vapor for about 50 minutes, then view the plate under short-wavelength UV light: the R_f value of the principal spot obtained from the *Assay preparation* corresponds to that obtained from the *Standard preparation*.

Uniformity of dosage units (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

Deliverable volume (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

pH (791): between 3.0 and 5.0; between 3.2 and 3.8 if sucrose is present.

Assay—

Mobile phase—To 6.8 g of monobasic potassium phosphate add 750 mL of water, and stir until solution is complete. Adjust with 1 M phosphoric acid to a pH of 3.5, dilute with water to 1000 mL, mix, and pass through a filter having a 10- μ m or finer porosity.

Standard preparation—Dissolve an accurately weighed quantity of USP Methylidopa RS in 0.1 N sulfuric acid to obtain a solution having a known concentration of about 1 mg of anhydrous methylidopa per mL.

Assay preparation—Transfer an accurately measured volume of Oral Suspension, freshly mixed, equivalent to about 250 mg of methylidopa, to a 250-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix to dissolve the methylidopa. Pass the solution through a 0.45- μ m membrane filter before using.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-mm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

Procedure—Separately inject equal volumes (about 50 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of $C_{10}H_{13}NO_4$ in each mL of the Oral Suspension taken by the formula:

$$250(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Methylidopa RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and r_U and r_S are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methylidopa Tablets

DEFINITION

Methylidopa Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methylidopa ($C_{10}H_{13}NO_4$).

IDENTIFICATION

A.

Analysis: To about 10 mg of finely ground Tablets add 3 drops of a solution of ninhydrin in sulfuric acid (1 in 250).

Acceptance criteria: A dark purple color is produced within 5–10 min that changes to pale brownish yellow on addition of 3 drops of water.

B.

Analysis: To about 10 mg of finely ground Tablets add 2 mL of 0.1 N sulfuric acid and 2 mL of *Solution A*, prepared as directed in the *Assay*, followed by 0.25 mL of 6 N ammonium hydroxide.

Acceptance criteria: A dark purple color is produced immediately.

ASSAY

PROCEDURE

Solution A: Freshly dissolve 1 g of ferrous sulfate, 2 g of potassium sodium tartrate, and 100 mg of sodium bisulfite in water to make a 100-mL solution.

Solution B: 50 g/L of ammonium acetate in 20% alcohol. Adjust with 6 N ammonium hydroxide to a pH of 8.5.

Standard solution: 1 mg/mL of anhydrous methylidopa from USP Methylidopa RS in 0.1 N sulfuric acid

Sample solution: Nominally 1 mg/mL of methylidopa in 0.1 N sulfuric acid from NLT 20 powdered Tablets prepared as follows. To a 100-mL volumetric flask add 0.1 N sulfuric acid to fill about 50% of the volume of the flask, agitate by mechanical means for 15 min, and then dilute with 0.1 N sulfuric acid to volume. Filter the solution, and reject the first 20 mL of the filtrate.

Blank: Water

Instrumental conditions

Mode: UV-Vis

Analytical wavelength: 520 nm

Cell: 1 cm

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*
Pipet 5 mL each of *Standard solution*, *Sample solution*, and *Blank* into separate 100-mL volumetric flasks. Add to each flask 5 mL of *Solution A*, and dilute with *Solution B* to volume.

Calculate the percentage of the labeled amount of methylidopa ($C_{10}H_{13}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of USP Methylidopa RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylidopa in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 20 min

Instrumental conditions

Mode: UV

Analytical wavelength: 280 nm

Standard solution: USP Methylidopa RS in *Medium*

Sample solution: Sample per *Dissolution* (711). Dilute with *Medium* to a concentration similar to that of the *Standard solution*.

Analysis: Determine the amount of methylidopa ($C_{10}H_{13}NO_4$) dissolved.

Tolerances: NLT 80% (Q) of the labeled amount of methylidopa ($C_{10}H_{13}NO_4$) is dissolved.

UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**
USP Methylidopa RS

Methylidopa and Chlorothiazide Tablets

» Methylidopa and Chlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of methylidopa ($C_{10}H_{13}NO_4$) and chlorothiazide ($C_7H_6ClN_3O_4S_2$).

Packaging and storage—Preserve in well-closed containers.

USP Reference standards (11)—

USP Chlorothiazide RS

USP Methyldopa RS

Identification—Transfer the finely ground contents of 1 Tablet to a test tube, add 10 mL of dilute alcohol (1 in 2), shake for 5 minutes, and centrifuge. Use the clear supernatant as the Test solution. Prepare a solution of alcohol and 0.1 N sodium hydroxide (1:1) containing in each mL about 10 mg of USP Methyldopa RS and 10 mg of USP Chlorothiazide RS. Apply 20 μ L of the Test solution on a line parallel to and about 2 cm from the bottom edge of a 20-cm \times 10-cm thin-layer chromatographic plate (see *Chromatography* (621)) coated with chromatographic silica gel mixture, and apply 20 μ L of the Standard solution separately on the starting line. Allow the spots to dry, develop the chromatogram in a solvent system consisting of equal volumes of glacial acetic acid, acetone, butyl alcohol, toluene, and water until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing tank, and allow the solvent to evaporate. View the plate under short-wavelength UV light: the solution under test exhibits two major spots having R_f values corresponding to those of the two major spots obtained with the Standard solution.

Dissolution (711)—

PROCEDURE FOR METHYLDOPA—

Medium: 0.1 N hydrochloric acid; 900 mL.**Apparatus 2:** 75 rpm.**Time:** 30 minutes.

Standard preparation—Dissolve an accurately weighed quantity of USP Methyldopa RS in *Medium*, and dilute quantitatively with the same solvent to obtain a solution having a known concentration of about 275 μ g of anhydrous methyldopa per mL.

Ferrous tartrate solution—Dissolve 1 g of ferrous sulfate, 2 g of potassium sodium tartrate, and 100 mg of sodium bisulfite in water to make 100 mL, and mix. Use a freshly prepared solution.

Buffer solution—Dissolve 50 g of ammonium acetate in 1000 mL of dilute alcohol (1 in 5). Adjust with 6 N ammonium hydroxide to a pH of 8.5.

Procedure—Filter 35 mL of the solution under test, and transfer an aliquot estimated to contain between 2 mg and 3 mg of methyldopa to a 100-mL volumetric flask. Adjust the final volume, if necessary, with *Medium* to 10 mL. To a second 100-mL volumetric flask add 10.0 mL of *Standard preparation*, and to a third 100-mL volumetric flask add 10.0 mL of *Medium* to provide a blank. Pipet 5.0 mL of *Ferrous tartrate solution* into each flask, dilute with *Buffer solution* to volume, and mix. Concomitantly determine the absorbances of the treated *Standard preparation* and test solution at the wavelength of maximum absorbance at about 520 nm, with a suitable spectrophotometer, against the reagent blank. Calculate the amount of $C_{10}H_{13}NO_4$ dissolved, in mg, taken by the formula:

$$9(C/V)(A_U/A_S)$$

in which C is the concentration, in μ g of anhydrous methyldopa per mL, of USP Methyldopa RS in the *Standard preparation*; V is the volume, in mL, of the aliquot of test solution used; and A_U and A_S are the absorbances of the solutions from the test solution and the *Standard preparation*, respectively.

Tolerances—Not less than 80% (Q) of the labeled amount of $C_{10}H_{13}NO_4$ is dissolved in 30 minutes.

PROCEDURE FOR CHLOROTHIAZIDE—

Medium: 0.05 M, pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) containing sodium sulfite (1 in 5000); 900 mL.

Apparatus 2: 75 rpm.**Time:** 60 minutes.

Procedure—Determine the amount of $C_7H_6ClN_3O_4S_2$ dissolved from UV absorbances of the solution under test, suitably diluted with *Medium*, if necessary, at the wavelength of maximum absorbance at about 317 nm in comparison with a Standard solution having a known concentration of USP Chlorothiazide RS in the same *Medium*.

Tolerances—Not less than 75% (Q) of the labeled amount of $C_7H_6ClN_3O_4S_2$ is dissolved in 60 minutes.

Uniformity of dosage units (905): meet the requirements with respect to methyldopa and to chlorothiazide.

Assay—

Mobile phase—Prepare a filtered and degassed mixture of 0.08 M monobasic sodium phosphate and methanol (95:5). Adjust by the addition of phosphoric acid to a pH of 2.8. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

Standard preparation—Transfer to a 100-mL volumetric flask accurately weighed quantities of USP Methyldopa RS and USP Chlorothiazide RS, equivalent to one-fifth of their labeled amounts, in mg, per Tablet. Add 15 mL of water and 5 mL of 1 N hydrochloric acid, and sonicate for about 3 minutes. Add 10 mL of acetonitrile, and sonicate for 2 minutes. Dilute with water to volume, and mix.

Assay preparation—Weigh and finely powder not less than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to the weight of 1 Tablet, to a 500-mL volumetric flask. Add 75 mL of water and 25 mL of 1 N hydrochloric acid, and sonicate for about 5 minutes. Add 50 mL of acetonitrile, and sonicate for 10 minutes. Dilute with water to volume, and mix. Filter through a 0.45- to 2.0- μ m membrane filter, discarding the first 10 mL.

Chromatographic system (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm \times 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the chlorothiazide peak is not less than 1300 theoretical plates, the tailing factor for chlorothiazide peak is not more than 2, the resolution, R , between the chlorothiazide and methyldopa peaks is not less than 7, and the relative standard deviation for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 μ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 1.0 for methyldopa and 2.5 for chlorothiazide. Calculate the quantity, in mg, of chlorothiazide ($C_7H_6ClN_3O_4S_2$) in the portion of Tablets taken by the formula:

$$500C(r_U/r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorothiazide RS in the *Standard preparation*; and r_U and r_S are the peak responses of the chlorothiazide peak obtained from the *Assay preparation* and the *Standard preparation*, respectively. Calculate the quantity, in mg, of methyldopa ($C_{10}H_{13}NO_4$) taken by the same formula, reading "methyldopa" instead of "chlorothiazide."

Methyldopa and Hydrochlorothiazide Tablets

DEFINITION

Methyldopa and Hydrochlorothiazide Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of methyldopa ($C_{10}H_{13}NO_4$) and hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$).

IDENTIFICATION

- A.** The retention times of the two major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

- B.**

Analysis: To 10 mg of methyldopa from a portion of crushed Tablets add 0.15 mL of a solution of ninhydrin in sulfuric acid (1 in 250).

Acceptance criteria: A dark purple color is produced within 5–10 min. The color changes to pale brownish yellow upon adding 0.15 mL of water.

ASSAY

PROCEDURE

Buffer: 11.04 g/L of monobasic sodium phosphate. Initially add 950 mL of water, adjust with phosphoric acid to a pH of 2.8, and then dilute with water to volume.

Mobile phase: Methanol and *Buffer* (5:95)

Standard solution: Transfer a suitable quantity of USP Methyldopa RS to a suitable volumetric flask to prepare a 1-mg/mL solution of anhydrous methyldopa. Add a quantity of USP Hydrochlorothiazide RS that corresponds to the ratio of hydrochlorothiazide to methyldopa in the Tablets. Dissolve in 25% of the total volume a mixture of water, acetonitrile, and 1 N hydrochloric acid (1:1:0.5). Dilute with water to volume.

Sample solution: Transfer an equivalent to 250 mg of methyldopa (NLT 20 Tablets) to a 250-mL volumetric flask, and add 50 mL of water, 25 mL of acetonitrile, and 13 mL of 1 N hydrochloric acid. Shake the flask for 5 min, and dilute with water to volume.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 270 nm

Column: 3.9-mm × 30.0-cm; packing L1

Flow rate: 2 mL/min

Injection volume: 10 µL

System suitability

Sample: *Standard solution*

[NOTE—Adjust the flow rate to obtain relative retention times of about 0.38 and 1.0 for methyldopa and hydrochlorothiazide, respectively.]

Suitability requirements

Resolution: NLT 6.0 between methyldopa and hydrochlorothiazide

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methyldopa ($C_{10}H_{13}NO_4$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of methyldopa from the *Sample solution*

r_S = peak response of methyldopa from the *Standard solution*

C_S = concentration of USP Methyldopa RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methyldopa in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response of hydrochlorothiazide from the *Sample solution*

r_S = peak response of hydrochlorothiazide from the *Standard solution*

C_S = concentration of USP Hydrochlorothiazide RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of hydrochlorothiazide in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

DISSOLUTION (711)

Methyldopa

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 30 min

Solution A: 10 mg/mL of ferrous sulfate, 20 mg/mL of potassium sodium tartrate, and 1 mg/mL of sodium bisulfite in water. [NOTE—Use a freshly prepared solution.]

Solution B: 50 mg/mL of ammonium acetate in dilute alcohol (1 in 5). Adjust with 6 N ammonium hydroxide to a pH of 8.5.

Standard solution: 0.275 mg/mL of anhydrous methyldopa from USP Methyldopa RS in *Medium*

Sample solution: Filter 35 mL of the solution under test through paper.

Instrumental conditions

Mode: Vis

Analytical wavelength: 520 nm

Cell: 1 cm

Analysis

Samples: *Standard solution* and *Sample solution*

Transfer an aliquot of the *Sample solution* estimated to contain 2–3 mg of methyldopa to a 100-mL volumetric flask. Adjust the final volume, if necessary, with *Medium* to 10 mL. To a second 100-mL volumetric flask add 10.0 mL of *Standard solution*, and to a third 100-mL volumetric flask add 10.0 mL of *Medium* to provide a blank. Pipet 5.0 mL of *Solution A* into each flask, dilute with *Solution B* to volume, and mix. Determine the absorbances of the *Standard solution* and the *Sample solution* at the wavelength of maximum absorbance, using the blank in the reference cell. Calculate the percentage of the labeled amount of methyldopa ($C_{10}H_{13}NO_4$) dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

A_U = absorbance of the *Sample solution*

A_S = absorbance of the *Standard solution*

C_S = concentration of anhydrous methyldopa in the *Standard solution* (µg/mL)

L = label claim (mg/Tablet)

V = volume of the medium, 900 mL

Tolerances: NLT 80% (Q) of the labeled amount of methyldopa ($C_{10}H_{13}NO_4$) is dissolved.

Hydrochlorothiazide

Medium: 0.1 N hydrochloric acid; 900 mL

Apparatus 2: 50 rpm

Time: 60 min

Instrumental conditions

Mode: Vis

Analytical wavelength: 317 nm

Cell: 1 cm

Standard solution: USP Hydrochlorothiazide RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter. Dilute with *Medium* to a concentration that is similar to the *Standard solution*.
Tolerances: NLT 80% (Q) of the labeled amount of hydrochlorothiazide ($C_7H_8ClN_3O_4S_2$) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS (905)**

Procedure for content uniformity: Proceed as directed in the *Assay*, except use the following *Sample solution*.

Sample solution: Transfer 1 Tablet to a 250-mL volumetric flask, add 50 mL of water, and shake gently, if necessary, to disintegrate the Tablet. Do not sonicate. After the Tablet has completely disintegrated, add 25 mL of acetonitrile, and shake by mechanical means for 30 min. Add 13 mL of 1 N hydrochloric acid, and shake by mechanical means for an additional 5 min. Dilute with water to volume.

Acceptance criteria: Meet the requirements with respect to methyldopa and hydrochlorothiazide

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS (11)**

USP Hydrochlorothiazide RS
 USP Methyldopa RS

Methyldopate Hydrochloride

$C_{12}H_{17}NO_4 \cdot HCl$ 275.73

L-Tyrosine, 3-hydroxy- α -methyl-, ethyl ester, hydrochloride.
 L-3-(3,4-Dihydroxyphenyl)-2-methylalanine ethyl ester hydrochloride [5123-53-5; 2508-79-4].

» Methyldopate Hydrochloride contains not less than 98.0 percent and not more than 101.0 percent of $C_{12}H_{17}NO_4 \cdot HCl$, calculated on the dried basis.

Packaging and storage—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

USP Reference standards (11)—

USP Methyldopate Hydrochloride RS

Identification—

A: Infrared Absorption (197M).

B: Ultraviolet Absorption (197U)—

Solution: 50 μ g per mL.

Medium: 0.1 N hydrochloric acid.

Absorptivities at 280 nm, calculated on the dried basis, do not differ by more than 3.0%.

C: It responds to *Identification test C* under *Methyldopa*.

D: It responds to the tests for *Chloride* (191), except that on the addition of the slight excess of 6 N ammonium hydroxide a brown precipitate is formed.

Specific rotation (781S): between -13.5° and -14.9° ($\lambda = 405$ nm).

Test solution: 40 mg per mL, in 0.1 N hydrochloric acid.

pH (791): between 3.0 and 5.0, in a solution (1 in 100).

Loss on drying (731)—Dry it at 100° and at a pressure not exceeding 5 mm of mercury for 2 hours: it loses not more than 0.5% of its weight.

Residue on ignition (281): not more than 0.1%.

Delete the following:

• **Heavy metals, Method II (231):** 0.001%. • (Official 1-Jan-2018)

Assay—

Mobile solvent—Prepare a suitable solution of 0.02 M monobasic sodium phosphate and 0.015 M phosphoric acid in a water and methanol solution (approximately 15.5:4.5) such that the retention time of methyldopate hydrochloride is approximately 6.5 minutes.

Standard preparation—Dissolve an accurately weighed quantity of USP Methyldopate Hydrochloride RS in the *Mobile solvent* to obtain a solution containing about 1 mg per mL.

Assay preparation—Transfer about 50 mg of Methyldopate Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Mobile solvent* to volume.

Procedure—Introduce separately 20- μ L portions of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* (621)) operated at 25°, by means of a suitable microsyringe or sampling valve, adjusting the operating parameters such that the peak obtained with the *Standard preparation* is 100% full-scale. Typically, the apparatus is fitted with a 4-mm \times 30-cm column that contains packing L1, is equipped with an UV detector capable of monitoring absorption at 280 nm and a suitable recorder, and is capable of operating at a column pressure between 700 and 1700 psi. In a suitable chromatogram, three replicate injections of the *Standard preparation* show a relative standard deviation of not more than 1.5%. Determine the peak areas, at equivalent retention times, obtained with the *Assay preparation* and the *Standard preparation*, and calculate the quantity, in mg, of $C_{12}H_{17}NO_4 \cdot HCl$ in the portion of Methyldopate Hydrochloride taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Methyldopate Hydrochloride RS in the *Standard preparation*; and A_U and A_S are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methyldopate Hydrochloride Injection

» Methyldopate Hydrochloride Injection is a sterile solution of Methyldopate Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methyldopate hydrochloride ($C_{12}H_{17}NO_4 \cdot HCl$).

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.

USP Reference standards (11)—

USP Endotoxin RS

USP Methyldopate Hydrochloride RS

Identification—

A: Dilute a volume of Injection with a mixture of chloroform and methanol (1:1), if necessary, to obtain a solution containing about 5 mg of methyldopate hydrochloride per mL. Apply separately 10 μ L of this solution and 10 μ L of a *Standard solution* of USP Methyldopate Hydrochloride RS in a solvent mixture of chloroform and methanol (1:1) containing 5 mg per mL to a suitable thin-layer chromatographic

plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a saturated chamber with a solvent system consisting of a mixture of butyl alcohol, water, and formic acid (7:2:1), until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with Folin-Ciocalteu phenol TS followed by spraying with sodium carbonate solution (1 in 10); the R_f value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

B: It responds to the tests for *Chloride* (191), with the exception that the 6 N ammonium hydroxide is omitted.

Bacterial Endotoxins Test (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of methyldopate hydrochloride.

pH (791): between 3.0 and 4.2.

Particulate Matter in Injections (788): meets the requirements under small-volume injections.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—

Buffer solution—To 214 g of monobasic potassium phosphate add 700 mL of water, and stir. Cautiously add 75 mL of sodium hydroxide solution (1 in 2), and stir until solution is complete. Adjust with sodium hydroxide solution (1 in 2) to a pH of 8.0, and dilute with water to 1000.0 mL.

Water-saturated tributyl phosphate—Shake 800 mL of tributyl phosphate with 100 mL of water, and discard the lower, aqueous phase. Filter the upper phase.

Standard preparation—Transfer about 25 mg of USP Methyldopate Hydrochloride RS, accurately weighed, to a 25-mL volumetric flask, add water to volume, and mix. Transfer 5 mL of this solution to a 100-mL volumetric flask, add 0.1 N sulfuric acid to volume, and mix. Use a freshly prepared solution. The *Standard preparation* contains about 50 µg per mL.

Assay preparation—Transfer to a 50-mL volumetric flask an accurately measured volume of Injection, equivalent to about 50 mg of methyldopate hydrochloride, add water to volume, and mix. Transfer a 5.0-mL aliquot of the solution to a 60-mL separator, add 15 mL of *Buffer solution* and 10 mL of *Water-saturated tributyl phosphate*, and shake for about 1 minute. Allow the phases to separate, and transfer the lower, aqueous phase to a second 60-mL separator. To this separator add a second 10-mL portion of *Water-saturated tributyl phosphate*, shake for about 1 minute, allow the phases to separate, discard the lower, aqueous phase, and add the upper tributyl phosphate phase to the phase retained in the first separator. Rinse the second separator with about 2 mL of *Water-saturated tributyl phosphate*, and add the rinsing to the first separator. Extract the phase contained in the first separator with two 25-mL portions of 0.1 N sulfuric acid. Collect the acid extracts in a 100-mL volumetric flask, add 0.1 N sulfuric acid to volume, and mix. Filter, if necessary, to obtain a clear solution.

Procedure—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 283 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Calculate the quantity, in mg, of methyldopate hydrochloride ($C_{12}H_{17}NO_4 \cdot HCl$) in each mL of the Injection taken by the formula:

$$(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Methyldopate Hydrochloride RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and A_U and A_S are

the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

Methylene Blue Injection

» Methylene Blue Injection is a sterile solution of Methylene Blue in Water for Injection. It contains, in each mL, not less than 9.5 mg and not more than 10.5 mg of methylene blue ($C_{16}H_{18}ClN_3S \cdot 3H_2O$).

Packaging and storage—Preserve in single-dose containers, preferably of Type I glass.

USP Reference standards (11)—

- USP Endotoxin RS
- USP Methylene Blue RS

Identification—

A: The visible absorption spectrum of the solution employed for measurement of absorbance in the Assay exhibits maxima and minima at the same wavelengths as that of the Standard solution employed in the Assay, concomitantly measured.

B: Dilute a portion of the Injection with an equal volume of methanol. Dissolve 5 mg of USP Methylene Blue RS in 1 mL of a mixture of equal volumes of methanol and water. Apply 1 μ L of each solution to a thin-layer chromatographic plate, coated with a 0.25-mm layer of chromatographic silica gel, allow the spots to dry, and develop the chromatogram, using a mixture of water, alcohol, and acetic acid (4:3:3) as the solvent system, until the solvent front has moved about 10 cm above the line of application. Remove the plate from the developing chamber, and allow the solvent to evaporate: the R_f value of the principal spot obtained from the Methylene Blue corresponds to that obtained from the Reference Standard.

Bacterial Endotoxins Test (85)—It contains not more than 2.5 USP Endotoxin Units per mL.

pH (791): between 3.0 and 4.5.

Other requirements—It meets the requirements under *Injections and Implanted Drug Products* (1).

Assay—Dilute an accurately measured volume of Injection, equivalent to about 100 mg of methylene blue trihydrate to a 200-mL volumetric flask, dissolve in and dilute with diluted alcohol to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, dilute with diluted alcohol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with diluted alcohol to volume, and mix. This solution contains about 2.4 μ g of methylene blue trihydrate (2 μ g of anhydrous methylene blue) per mL. Prepare a Standard solution of USP Methylene Blue RS as directed in the Assay under *Methylene Blue*. Concomitantly determine the absorbance of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 663 nm, with a suitable spectrophotometer, using diluted alcohol as the blank. Calculate the quantity, in mg, of

methylene blue ($C_{16}H_{18}ClN_3S \cdot 3H_2O$) in each mL of the Injection taken by the formula:

$$(373.90 / 319.86)(40C / V)(A_U / A_S)$$

in which 373.90 and 319.86 are the molecular weights of methylene blue trihydrate and anhydrous methylene blue, respectively; C is the concentration, in μ g per mL, of USP Methylene Blue RS in the Standard solution; V is the volume, in mL, of Injection taken; and A_U and A_S are the absorbances of the solution from the Injection and the Standard solution, respectively.

Methylene Blue Injection, Veterinary**DEFINITION**

Methylene Blue Injection, Veterinary is a sterile solution of Methylene Blue in Water for Injection. It contains NLT 9.5 mg/mL and NMT 10.5 mg/mL of methylene blue trihydrate ($C_{16}H_{18}ClN_3S \cdot 3H_2O$). Prepare Methylene Blue Injection, Veterinary as follows (see *Pharmaceutical Compounding—Sterile Preparations* (797)):

Methylene Blue	5 g
Sterile Water for Injection or Sodium Chloride Injection (0.9%), a sufficient quantity to make	500 mL

Dissolve an accurately weighed quantity of Methylene Blue in Sterile Water for Injection or Sodium Chloride Injection (0.9%), and dilute to volume, with mixing. Sterilize by a suitable means, such as sterile filtration or autoclaving.

IDENTIFICATION

- **A.** The visible absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of the *Standard solution*, concomitantly measured as directed in the Assay.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**
 - Diluent:** Methanol and water (1:1)
 - Standard solution:** 5 mg/mL of USP Methylene Blue RS in Diluent

• LOSS ON DRYING (731)

Analysis: Dry under vacuum at 80° to constant weight.

Acceptance criteria: NMT 2.0%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store in a cold place.

• USP REFERENCE STANDARDS (11)

USP Methylergonovine Maleate RS

Methylergonovine Maleate Injection

DEFINITION

Methylergonovine Maleate Injection is a sterile solution of Methylergonovine Maleate in Water for Injection. Each mL contains NLT 90.0% and NMT 110.0% of the labeled amount of methylergonovine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$).

IDENTIFICATION

• **A.** The R_f values of the principal fluorescent spot and the principal blue spot of the *Sample solution* correspond to those of the *Standard stock solution*, as obtained in the procedure for *Organic Impurities, Related Alkaloids*.

• B. PROCEDURE

Sample solution: 0.67 mg/mL of methylergonovine maleate from Injection in water

Analysis: The *Sample solution* exhibits a bluish fluorescence under UV light. To this solution add 2 mL of a solution of glacial acetic acid in ethyl acetate (1:2), and stratify 2 mL of sulfuric acid, by pipetting, under the solution.

Acceptance criteria: A bluish-purple ring appears at the interface of the two liquids.

ASSAY

• PROCEDURE

[NOTE—Conduct this procedure with minimum exposure to light.]

Mobile phase: Acetonitrile and 0.015 M monobasic potassium phosphate solution (1:4)

Diluent: 5 mg/mL of tartaric acid in water and methanol (1:1). Allow the mixture to cool before use. [NOTE—Dissolve tartaric acid with water, then add an equal volume of methanol.]

Standard solution: 100 μ g/mL of USP Methylergonovine Maleate RS in *Diluent*. [NOTE—Shake by mechanical means for 15 min or until completely dissolved.]

Sample solution: 100 μ g/mL of methylergonovine maleate from Injection in *Diluent*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 240 nm

Column: 4-mm \times 25-cm; packing L7

Column temperature: 30°

Flow rate: 2 mL/min

Injection size: 20 μ L

System suitability

Sample: *Standard solution*

Suitability requirements

Column efficiency: NLT 1000 theoretical plates

Tailing factor: NMT 2.0

Relative standard deviation: NMT 2.0%

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of $C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$ in each mL of Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methylergonovine Maleate RS in the *Standard solution* (μ g/mL)

C_U = nominal concentration of the *Sample solution* (μ g/mL)

Acceptance criteria: 90.0%–110.0%

IMPURITIES

Organic Impurities

• PROCEDURE: RELATED ALKALOIDS

[NOTE—Conduct this test promptly, without exposure to daylight and with minimum exposure to artificial light.]

Diluent: Alcohol and ammonium hydroxide (9:1)

[NOTE—All solutions should be prepared immediately before use.]

Standard stock solution: 10 mg/mL of USP Methylergonovine Maleate RS in *Diluent*

Standard solution A: 0.50 mg/mL of USP Methylergonovine Maleate RS from the *Standard stock solution* in *Diluent*

Standard solution B: 0.20 mg/mL of USP Methylergonovine Maleate RS from the *Standard stock solution* in *Diluent*

Standard solution C: 0.10 mg/mL of USP Methylergonovine Maleate RS from the *Standard stock solution* in *Diluent*

Standard solution D: 0.05 mg/mL of USP Methylergonovine Maleate RS from the *Standard stock solution* in *Diluent*

Sample solution: Transfer the equivalent of 5 mg of methylergonovine maleate from Injection to a separator, and extract with three 5-mL portions of chloroform. Discard the chloroform extracts. Render alkaline to litmus with 6 N ammonium hydroxide, and extract with three 5-mL portions of chloroform. Evaporate the combined extracts with the aid of a current of air, but without heat, to dryness. Dissolve the residue so obtained in 0.5 mL of *Diluent*.

Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

Mode: TLC

Adsorbent: 0.25-mm layer of chromatographic silica gel mixture

Application volume: 5 μ L

Developing solvent system: Chloroform, methanol, and water (75:25:3), equilibrated for 30 min

Spray reagent: 10 mg/mL of *p*-dimethylaminobenzaldehyde in a cooled mixture of alcohol and hydrochloric acid (1:1)

Analysis

Samples: *Standard stock solution*, *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, and *Sample solution*
Proceed as directed in the chapter. Locate the spots on the plate by spraying thoroughly and evenly with *Spray reagent*. Immediately dry in a stream of nitrogen for 2 min.

Acceptance criteria: The R_f value of the principal spot from the *Sample solution* corresponds to that from the *Standard stock solution*. Estimate the concentration of any other spots observed in the lane for the *Sample solution* by comparison with *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Standard solution D*: the spots from the 0.50-, 0.20-, 0.10-, and 0.05-mg/mL dilutions are equivalent to 5.0%, 2.0%, 1.0%, and 0.50% of impurities, respectively. The sum of the impurities is NMT 5.0%.

SPECIFIC TESTS

- **pH (791):** 2.7–3.5
- **BACTERIAL ENDOTOXINS TEST (85):** NMT 1.7 USP Endotoxin Units/ μ g of methylergonovine maleate
- **OTHER REQUIREMENTS:** Meets the requirements under *Injections and Implanted Drug Products* (1)

ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose, light-resistant containers, preferably of Type I glass. Store in a refrigerator.
- **USP REFERENCE STANDARDS (11)**
USP Endotoxin RS
USP Methylergonovine Maleate RS

Methylergonovine Maleate Tablets

» Methylergonovine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of methylergonovine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$).

Packaging and storage—Preserve in tight, light-resistant containers.

USP Reference standards (11)—
USP Methylergonovine Maleate RS

Identification—

A: The R_f values of the principal fluorescent spot and the principal blue spot in the chromatogram of the *Test preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the test for *Related alkaloids* under *Ergonovine Maleate*, using the Tablets instead of Ergonovine Maleate.

B: Transfer a quantity of powdered Tablets, equivalent to about 4 mg of methylergonovine maleate, to a separator, add 20 mL of water, and render alkaline to litmus with sodium carbonate solution (1 in 10). Extract with three 20-mL portions of chloroform, filter the combined chloroform extracts into a small evaporating dish, and evaporate on a steam bath to dryness. Dissolve the residue in a mixture of 6 mL of water and 0.3 mL of hydrochloric acid, and filter, if necessary: the solution so obtained exhibits a bluish fluorescence under UV light. To this solution, add 2 mL of a solution of glacial acetic acid in ethyl acetate (1 in 2), and stratify 2 mL of sulfuric acid, by pipetting, under the solution: a bluish purple ring appears at the interface of the two liquids.

Dissolution (711)—

Medium: tartaric acid solution (1 in 200); 900 mL.

Apparatus 2: 75 rpm.

Time: 30 minutes.

Procedure—Filter a portion of the solution under test into a flask. Concomitantly determine the fluorescence intensity of this solution in comparison with a *Standard solution* of USP Methylergonovine Maleate RS in the same medium having a known concentration of about 0.22 μ g per mL in a fluorometer at an excitation wavelength of about 327 nm and an emission wavelength of about 428 nm, using tartaric acid solution (1 in 200) as the blank.

Tolerances—Not less than 70% (Q) of the labeled amount of $C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$ is dissolved in 30 minutes.

Uniformity of dosage units (905): meet the requirements.

Related alkaloids—[NOTE—Conduct this test without exposure to daylight and with the minimum exposure to artificial light.]

Solvent mixture—Mix 75 volumes of chloroform, 25 volumes of methanol, and 1 volume of ammonium hydroxide.

Detecting reagent—Cautiously dissolve 800 mg of *p*-dimethylaminobenzaldehyde in a mixture of alcohol and sulfuric acid (101:11).

Test preparation—Transfer a quantity of finely powdered Tablets, equivalent to 5.0 mg of methylergonovine maleate, to a suitable container, add 50 mL of *Solvent mixture*, and stir with the aid of a magnetic stirrer for 40 minutes. Filter, rinsing the container with two 10-mL portions of *Solvent mixture*. Evaporate the combined filtrates in vacuum at 25° to 30°, and dissolve the residue in 2.0 mL of *Solvent mixture*.

Standard stock solution—Transfer 25 mg of USP Methylergonovine Maleate RS to a 10-mL volumetric flask, add *Solvent mixture* to volume, and mix to obtain a solution having a known concentration of 2.5 mg per mL.

Standard preparations A, B, C, and D—Dilute accurately measured volumes of *Standard stock solution* quantitatively with *Solvent mixture* (designated below as parts by volume of *Standard stock solution* in total parts by volume of the finished *Standard preparation*) to obtain *Standard preparations*, designated below by letter, having the following concentrations and percentage assignments:

A: (1 in 20); 125 μ g per mL (5.0%).

B: (1 in 33); 75 μ g per mL (3.0%).

C: (1 in 100); 25 μ g per mL (1.0%).

D: (1 in 200); 12.5 μ g per mL (0.5%).

Procedure—Apply separately 20 μ L of the *Test preparation* and 20 μ L of each *Standard preparation* to a suitable thin-

layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Dry the plate with the aid of a stream of cool air. Position the plate in a chromatographic chamber, and develop the chromatograms in *Solvent mixture* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in a stream of cool air. Examine the plate under long-wavelength UV light. Mark the principal and any secondary fluorescent spots. Spray the plate with *Detecting reagent*, and mark the principal and secondary blue spots. Compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: the sum of the intensities of secondary spots obtained from the *Test preparation* corresponds to not more than 5.0% of related compounds.

Assay—[NOTE—Conduct this procedure with a minimum exposure to light.]

Mobile phase, Solvent mixture, Standard preparation, and Chromatographic system—Proceed as directed in the *Assay* under *Methylergonovine Maleate*.

Assay preparation—Place 10 Tablets in 1 500-mL volumetric flask, add 400 mL of *Solvent mixture*, and shake by mechanical means for 15 minutes or until completely disintegrated. Dilute with *Solvent mixture* to volume, and mix. Allow the solution to settle for not less than 30 minutes before use, and then filter to obtain the *Assay preparation*.

Procedure—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of methylergonovine maleate ($C_{20}H_{25}N_3O_2 \cdot C_4H_4O_4$) in the portion of Tablets taken by the formula:

$$(L/D)(C)(r_U/r_S)$$

in which *L* is the labeled quantity, in mg, of methylergonovine maleate in each Tablet, *D* is the concentration, in µg per mL, of methylergonovine maleate in the *Assay preparation*, based on the labeled quantity per Tablet and the extent of dilution, *C* is the concentration, in µg per mL, of USP Methylergonovine Maleate RS in the *Standard preparation*, and *r_U* and *r_S* are the responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

Methylphenidate Hydrochloride

$C_{14}H_{19}NO_2 \cdot HCl$ 269.77
2-Piperidineacetic acid, α-phenyl-, methyl ester, hydrochloride, (*R*,R**)-(±)-;
Methyl α-phenyl-2-piperidineacetate hydrochloride;
(*RS*)-Methyl-2-phenyl-2-[(*RS*)-piperidin-2-yl] acetate, hydrochloride [23655-65-4].

DEFINITION

Methylphenidate Hydrochloride contains NLT 98.0% and NMT 102.0% of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$), calculated on the dried basis.

IDENTIFICATION

- **A. INFRARED ABSORPTION** (197M)
- **B. IDENTIFICATION TESTS—GENERAL, Chloride** (191): Meets the requirement for the silver nitrate precipitate test

ASSAY

PROCEDURE

Buffer: 2.7 g/L of monobasic potassium phosphate
Mobile phase: Methanol and *Buffer* (1:2). Adjust with phosphoric acid to a pH of 4.6 ± 0.1 .

System suitability solution: 0.005 mg/mL of USP Methylphenidate Related Compound A RS and 0.5 mg/mL of USP Methylphenidate Hydrochloride RS in the *Mobile phase*

Standard solution: 0.5 mg/mL of USP Methylphenidate Hydrochloride RS in *Mobile phase*

Sample solution: 0.5 mg/mL of Methylphenidate Hydrochloride in *Mobile phase*

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 209 nm

Column: 4.6-mm × 25-cm; 5-µm packing L1

Flow rate: 1.0 mL/min

Injection volume: 10 µL

Run time: 2 times the retention time of methylphenidate

System suitability

Sample: *System suitability solution*

Suitability requirements

Tailing factor: NMT 3.0 for the methylphenidate peak

Resolution: NLT 2.5 between methylphenidate related compound A and methylphenidate

Relative standard deviation: NMT 2.0% for the methylphenidate peak

Analysis

Samples: *Standard solution* and *Sample solution*
Calculate the percentage of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in the portion of the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylphenidate Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 98.0%–102.0% on the dried basis

IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.1%

Delete the following:

- **HEAVY METALS, Method II** (231): NMT 10 ppm • (Official 1-

Jan-2018)

- **ORGANIC IMPURITIES, PROCEDURE 1**

Buffer, Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Sample: *Sample solution*

Identify each impurity using the relative retention times in *Table 1*. Calculate the percentage of each impurity

in the portion of Methylphenidate Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

r_U = peak response for each impurity in the *Sample solution*

r_T = sum of the responses for all impurity peaks including the methylphenidate peak in the *Sample solution*

Acceptance criteria: See Table 1.

Table 1

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Erythro isomer ^a	0.58	0.15
Methylphenidate related compound A	0.85	0.5
Methylphenidate	1.0	—
Any individual, unspecified impurity	—	0.10
Total impurities	—	1.0

^a (RS)-Methyl-2-phenyl-2-[(SR)-piperidin-2-yl] acetate.

• ORGANIC IMPURITIES, PROCEDURE 2

[NOTE—Perform this test only if ethylphenidate or bis-1,2-(α -carboxymethylbenzyl) piperidine is a known process impurity.]

Buffer A: 5.7 g of monobasic ammonium phosphate and 1.6 g of 1-octanesulfonate sodium in 1 L of water

Buffer B: Add 4 mL of triethylamine to 1 L of Buffer A. Adjust with phosphoric acid to a pH of 2.9.

Solution A: Acetonitrile and Buffer B (7:43)

Solution B: Acetonitrile and Buffer A (4:1)

System suitability solution: 0.5 mg/mL of USP Methylphenidate Hydrochloride RS; and 3 μ g/mL each of USP Methylphenidate Related Compound A RS, phenylacetic acid, and USP Methylphenidate Hydrochloride Erythro Isomer Solution RS in Solution A

Standard solution: 0.5 μ g/mL of USP Methylphenidate Hydrochloride RS in Solution A

Sample solution: 0.5 mg/mL of Methylphenidate Hydrochloride in Solution A. [NOTE—Allow the solution to stand for at least 2 h.]

Mobile phase: See Table 2. (See also Chromatography (621), System Suitability).

Table 2

Time (min)	Solution A (%)	Solution B (%)
0	90	10
7	65	35
10	50	50
12	50	50
13	90	10
16	90	10

[NOTE—Equilibration of the chromatographic system at the initial conditions for a minimum of 30 min is recommended before the first injection.]

Chromatographic system

(See Chromatography (621), System Suitability.)

Mode: LC

Detector: UV 220 nm

Column: 3.9-mm \times 15-cm; 5- μ m packing L7

Column temperature: 40°

Flow rate: 2.8 mL/min

Injection volume: 10 μ L

System suitability

Sample: System suitability solution. [NOTE—Identify the peaks using the relative retention times in Table 3.]

Suitability requirements

Resolution: NLT 2.7 between methylphenidate related compound A and phenylacetic acid; NLT than 3.6 between phenylacetic acid and erythro isomer

Tailing factor: NMT 2.0 for the methylphenidate peak

Relative standard deviation: NMT 2.0% for the methylphenidate peak; NMT 5.0% for methylphenidate related compound A, phenylacetic acid, and methylphenidate hydrochloride erythro isomer

Analysis

Samples: Standard solution and Sample solution

Calculate the percentage of any individual impurity in the portion of Methylphenidate Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

r_U = peak response for each impurity peak from the *Sample solution*

r_S = peak response for the methylphenidate peak from the *Standard solution*

C_S = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = concentration of Methylphenidate Hydrochloride in the *Sample solution* (mg/mL)

F = relative response factor (see Table 3)

Acceptance criteria: See Table 3.

Table 3

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Methylphenidate related compound A	0.55	1.1	0.2
Phenylacetic acid	0.67	1.0	0.1
Erythro isomer ^a	0.80	1.0	0.2
Methylphenidate	1.0	—	—
Ethylphenidate ^b	1.22	0.9	0.1
Bis-methylphenidate ^c	1.80	2.6	0.1
Any individual, unspecified impurity	—	1.0	0.1
Total impurities	—	—	0.5

^a (RS)-Methyl-2-phenyl-2-[(SR)-piperidin-2-yl] acetate.

^b Ethyl 2-phenyl-2-(piperidin-2-yl)acetate.

^c 1,2-Bis(carboxymethylbenzyl)piperidine. [NOTE—Also known as 1,2-(α -carboxymethylbenzyl)piperidine.]

SPECIFIC TESTS

• LOSS ON DRYING (731)

Analysis: Dry a sample in a vacuum at 60° for 4 h.

Acceptance criteria: NMT 0.5%

ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **LABELING:** If a test for *Organic Impurities* other than *Procedure 1* is used, then the labeling states the procedure with which the article complies.

• USP REFERENCE STANDARDS (11)

USP Methylphenidate Hydrochloride RS

USP Methylphenidate Hydrochloride Erythro Isomer Solution RS

This solution contains 0.5 mg of methylphenidate hydrochloride erythro isomer per mL in methanol.

USP Methylphenidate Related Compound A RS
 α -Phenyl-2-piperidineacetic acid hydrochloride.

$C_{13}H_{17}NO_2 \cdot HCl$ 255.74

Methylphenidate Hydrochloride Tablets

DEFINITION

Methylphenidate Hydrochloride Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$).

IDENTIFICATION

• A. INFRARED ABSORPTION (197M)

Sample: Equivalent to 50 mg of methylphenidate hydrochloride from a portion of powdered Tablets in a 40-mL centrifuge tube. Add 10 mL of chloroform, shake, and centrifuge. Filter the clear extract through a medium-sized sintered-glass funnel into a beaker, and repeat the extraction with an additional 10-mL portion of chloroform. Evaporate the combined chloroform extracts on a steam bath to dryness. Agitate the dried residue with 2 mL of acetonitrile, and filter the mixture through a small sintered-glass funnel. Wash the crystals with an additional 2 mL of acetonitrile, and dry them with the aid of suction.

Acceptance criteria: Meet the requirements

ASSAY

• PROCEDURE

Buffer: Dissolve 1.6 g of anhydrous sodium acetate in 900 mL of water. Adjust with acetic acid to a pH of 4.0. Dilute with water to 1 L.

Mobile phase: Methanol, acetonitrile, and *Buffer* (4:3:3)

Internal standard solution: 0.4 mg/mL of phenylephrine hydrochloride in *Mobile phase*

Standard stock solution: 0.2 mg/mL of USP

Methylphenidate Hydrochloride RS in *Mobile phase*

Standard solution: Mix 10.0 mL of the *Standard stock solution* with 5.0 mL of the *Internal standard solution*

Sample stock solution: 0.2 mg/mL of methylphenidate hydrochloride from finely powdered Tablets (NLT 20 Tablets) prepared as follows. Dissolve in *Mobile phase* using 70% of the final volume. Sonicate for 15 min, and cool to room temperature. Dilute with *Mobile phase* to volume. Pass a portion of this solution through a suitable membrane filter, discarding the first portion of the filtrate. Avoid the use of glass filters. Polypropylene filters are suitable for use.

Sample solution: Mix 10.0 mL of the clear filtrate from the *Sample stock solution* with 5.0 mL of the *Internal standard solution*.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm \times 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection size: 50 μ L

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for phenylephrine hydrochloride and methylphenidate hydrochloride are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the analyte and the internal standard peaks

Relative standard deviation: NMT 2.0% from the peak response ratios of the analyte to the internal standard

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- R_U = peak response ratio of the analyte to the internal standard from the *Sample solution*
 R_S = peak response ratio of the analyte to the internal standard from the *Standard solution*
 C_S = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution* (mg/mL)
 C_U = nominal concentration of Methylphenidate Hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

PERFORMANCE TESTS

• DISSOLUTION (711), Procedure for a Pooled Sample

Medium: Water; 900 mL

Apparatus 1: 100 rpm

Time: 45 min

Analysis: Determine the amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved by using the procedure in the *Assay*, making any necessary volumetric adjustments.

Tolerances: NLT 75% (Q) of the labeled amount of $C_{14}H_{19}NO_2 \cdot HCl$ is dissolved.

• UNIFORMITY OF DOSAGE UNITS (905):

Meet the requirements

ADDITIONAL REQUIREMENTS

• PACKAGING AND STORAGE:

Preserve in tight containers.

• USP REFERENCE STANDARDS (11)

USP Methylphenidate Hydrochloride RS

Methylphenidate Hydrochloride Extended-Release Tablets

DEFINITION

Methylphenidate Hydrochloride Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$).

IDENTIFICATION

• A. INFRARED ABSORPTION

Sample: Place a portion of powdered Tablets, equivalent to 100 mg of methylphenidate hydrochloride, in a 100-mL beaker. Add 20 mL of chloroform, stir for 5 min, and filter, collecting the filtrate. Evaporate the filtrate to about 5 mL. Add ethyl ether slowly, with stirring, until crystals form. Filter the crystals, wash with ethyl ether, and dry at 80° for 30 min.

Acceptance criteria: The IR absorption spectrum of a mineral oil dispersion of the crystals so obtained exhibits maxima only at the same wavelengths as those of a similar preparation of USP Methylphenidate Hydrochloride RS.

• B. The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

ASSAY

• PROCEDURE

Mobile phase: Dissolve 2 g of octanesulfonic acid sodium salt in 730 mL of water. Adjust with phosphoric acid to a pH of 2.7. Mix with 270 mL of acetonitrile.

Solution A: Acidified water; adjusted with phosphoric acid to a pH of 3

Diluent A: Acetonitrile and *Solution A* (25:75)

Diluent B: Acetonitrile and methanol (50:50)

System suitability solution: 80 μ g/mL of USP

Methylphenidate Hydrochloride RS, 1 μ g/mL of

methylphenidate hydrochloride erythro isomer from

USP Methylphenidate Hydrochloride Erythro Isomer So-

lution RS, and 2 µg/mL of USP Methylphenidate Related Compound A RS in *Diluent A*

Standard solution: 0.1 mg/mL of USP Methylphenidate Hydrochloride RS in *Diluent A*

Sample stock solution: Nominally 1 mg/mL of methylphenidate hydrochloride prepared as follows. Dissolve NLT 10 Tablets in a suitable volumetric flask with 20% of the total flask volume of *Diluent B*. [NOTE—Alternatively, a portion of powder from NLT 10 Tablets may be transferred to a suitable volumetric flask and suspended in 20% of the total flask volume of *Diluent B*.] Stir for 4 h. Dilute with *Solution A* to volume.

Sample solution: Nominally 0.1 mg/mL of methylphenidate hydrochloride in *Solution A* from the *Sample stock solution*. [NOTE—Centrifuge before chromatographic analysis.]

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 3.9-mm × 15-cm; 5-µm packing L1

Column temperature: 30°

Flow rate: 1 mL/min

Injection volume: 25 µL

Run time: 2 times the retention time of methylphenidate

System suitability

Samples: *System suitability solution* and *Standard solution*

[NOTE—See *Table 6* for relative retention times.]

Suitability requirements

Resolution: NLT 4.0 between methylphenidate related compound A and methylphenidate hydrochloride erythro isomer; NLT 6.0 between the methylphenidate and erythro isomer peaks, *System suitability solution*

Tailing factor: NMT 2.0 for the methylphenidate peak, *Standard solution*

Relative standard deviation: NMT 2.0% for the methylphenidate peak, *Standard solution*

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

r_U = peak response from the *Sample solution*

r_S = peak response from the *Standard solution*

C_S = concentration of USP Methylphenidate Hydrochloride RS in the *Standard solution* (mg/mL)

C_U = nominal concentration of methylphenidate hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

PERFORMANCE TESTS

• DISSOLUTION (711)

Test 1

Medium: Water; 500 mL

Apparatus 2: 50 rpm

Times: 1, 2, 3.5, 5, and 7 h

Buffer: Dissolve 1.6 g of anhydrous sodium acetate in 900 mL of water. Adjust with acetic acid to a pH of 4.0 and dilute with water to 1000 mL.

Mobile phase: Methanol, acetonitrile, and *Buffer* (40:30:30)

Internal standard solution: 0.4 mg/mL of phenylephrine hydrochloride in *Mobile phase*

Standard stock solution: $(1.5 \times [L/500])$ mg/mL of USP Methylphenidate Hydrochloride RS in *Mobile phase* where L is the label claim of methylphenidate hydrochloride in mg/Tablet

Standard solution: Transfer 10.0 mL of the *Standard stock solution* to a glass-stoppered, 25-mL conical flask, add 5.0 mL of the *Internal standard solution*, and mix.

Sample stock solution: Use portions of the solution under test passed through a suitable filter of 0.45-µm pore size. Do not use glass fiber filters.

Sample solution: Transfer 10.0 mL of the *Sample stock solution* to a glass-stoppered, 25-mL conical flask, add 5.0 mL of the *Internal standard solution*, and mix.

Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

Mode: LC

Detector: UV 210 nm

Column: 4.6-mm × 25-cm; packing L10

Flow rate: 1.5 mL/min

Injection volume: 50 µL

System suitability

Sample: *Standard solution*

[NOTE—The relative retention times for phenylephrine hydrochloride and methylphenidate hydrochloride are 0.8 and 1.0, respectively.]

Suitability requirements

Resolution: NLT 2.0 between the analyte and internal standard peaks

Relative standard deviation: NMT 2.0% for the peak response ratios of the analyte to the internal standard

Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved by using the procedure in the *Assay*, making any necessary volumetric adjustments.

Tolerances: See *Table 1*.

Table 1

Time (h)	Amount Dissolved (%)
1	25–45
2	40–65
3.5	55–80
5	70–90
7	NLT 80

The percentages of the labeled amount of methylphenidate hydrochloride ($C_{14}H_{19}NO_2 \cdot HCl$) dissolved at the times specified conform to *Dissolution* (711), *Acceptance Table 2*.

For products labeled for dosing every 24 h

Test 2: If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

Medium: Acidified water; adjusted with phosphoric acid to a pH of 3; 50 mL at $37 \pm 0.5^\circ$
